The paper thickness levers are located on the right side of the printer. One lever is on the outside of the printer, next to the paper tray. This lever controls the width of the space through which the paper enters the printer. The other lever is colored blue and is located inside the printer on the top right side of the print head mechanism. This lever controls the distance the print head mechanism is from the paper. The levers have two positions:

- Normal (for up to 100 normal sheets of paper)
- Envelope (for thicker paper or up to 15 envelopes)

The normal position has a document icon next to it (a piece of paper with the corner folded over) and the envelope position has an envelope icon next to it.

Status Lights

The two status lights are located on the upper center front panel.

- The Power light is the rectangular light located over the Apple logo.
- The Error light is the small round light just to the left of the Power light.

Status Light Indications

The green Power light comes on when power is applied to the printer; it blinks when the printer is printing.

The yellow Error light comes on to indicate one or more of the following situations:

- The printer is out of paper
- There is a paper jam
- There is a carriage jam inside the printer

StyleWriter II: Cleaning and Purging the Ink Cartridge

Revised: 1/5/93
Security: Everyone

StyleWriter II: Cleaning and Purging the Ink Cartridge

==========

Article Created: 6 January 1993

TOPIC

To improve print quality, the StyleWriter II automatically cleans and purges its ink cartridge by wiping paper fibers and dried ink from the print head. This article provides details on this process.

DISCUSSION

The StyleWriter II cleans and purges its ink cartridge by wiping the surface of the ink nozzles to remove paper fibers, capping the ink cartridge with a rubber cover, then pumping a small amount of fresh ink into the cartridge's ink nozzles. The entire process takes approximately 13 seconds.

Automatic Operation

Automatic cleaning and purging occurs when:

- The StyleWriter II is first switched on after being plugged in.
- The ink cartridge is replaced.
- The printer is first switched on more than 72 hours after the last cleaning operation.
- A user chooses to clean and purge the ink cartridge (manual operation, below).

Manual Operation

To clean and purge the ink cartridge at any time:

1) Select Options in the Print dialog box.

2) Select the box labeled "Clean ink cartridge before printing".

Cleaning and purging does consume a small amount of ink (about 0.1 cc). If you repeat the process unnecessarily, you will reduce the life of the cartridge.

StyleWriter II: Compatibility and Performance

Revised: 1/5/93
Security: Everyone

StyleWriter II: Compatibility and Performance

==========

Article Created: 6 January 1993

TOPIC ----------

This article discusses the StyleWriter II's compatibility.

DISCUSSION ----------

Software Compatibility

The StyleWriter II requires System 7, or System 6.0.7/6.0.8 with the TrueType INIT installed. The TrueType INIT is included with the StyleWriter II printer drivers. Color Macintosh computers must have 32-bit QuickDraw to work properly.

The StyleWriter II can use Adobe Type 1 and TrueType fonts, including fonts in a two-byte format. Adobe Type 1 fonts require the use of Adobe Type Manager

Performance

For best performance, Macintosh systems should have more than 2MB of RAM with System 6.0.7/6.0.8, or more than 4MB of RAM with System 7.

As with the StyleWriter printer, the StyleWriter II's performance is directly related to the type of Macintosh used and the complexity of the document. As a general rule, the faster the CPU and the simpler the document, the faster the StyleWriter II will print.

GrayShare: Description (10/94)

Revised: 10/27/94
Security: Everyone

GrayShare: Description (10/94)

==========

Article Created: 6 January 1993
Article Reviewed/Updated: 27 October 1994

TOPIC ----------

What is GrayShare and how is it different from grayscale printing?

DISCUSSION ----------

Difference Between GrayShare and Grayscale

GrayShare is Apple's trademark for its new printer driver software that provides, among other things, networking and grayscale printing for QuickDraw–based printers.

The term grayscale refers to the range of gray tones that a monitor or printer is capable of reproducing.

Benefits of GrayShare

GrayShare printer driver software provides:

- Networking capability
- Grayscale printing
- Image scaling in 1% increments
- Support for new paper sizes
- Ink cartridge cleaning

Image scaling and paper size are user-selectable in the Page Setup dialog box, while ink cartridge cleaning (only available in the StyleWriter series printers) is selectable from Options in the Print dialog box.

GrayShare enables printers to print dithered grayscale images. With GrayShare on the StyleWriter II, for example, the printer driver provides 138 shades of gray.

Parts of GrayShare

GrayShare consists of two parts:

1) The print driver - contains the image scaling, grayscale printing, paper sizes, and ink cartridge cleaning.
2) Printer Share Extension - provides networking capability.

Chooser Versions Required

System 7.x - v7.3 or later of the chooser is required to use GrayShare printers.
System 6.0.7 or 6.0.8 - v3.7 of the chooser is requred.

A GrayShare upgrade disk is available through online services that Apple publishes software updates on. This upgrade disk enables the LaserWriter LS and original StyleWriter printer to use the GrayShare technology.

StyleWriter II: Setting Passwords

Revised: 1/5/93
Security: Everyone

StyleWriter II: Setting Passwords

==========

Article Created: 6 January 1993

TOPIC ----------

This article discusses the use of passwords with the GrayShare software on a StyleWriter II.

DISCUSSION ----------

Introduction

The GrayShare software allows the "owner" (the person who has attached a StyleWriter II to his or her Macintosh) to control access to a shared StyleWriter II by setting a password.

- If the owner sets a password, only those users who know the password can print to the shared StyleWriter II.

- If the owner does not set a password, anyone can print to the shared StyleWriter II.

The password remains in effect until the printer is renamed, the password is changed, or the user selects another StyleWriter II. For security purposes, the password is always displayed as five bullet characters.

To set a password:

1) Share the StyleWriter II on the network (a separate article tells how to do this).

2) Type a password in the Password field of the Sharing Setup menu.

Changing the Password

If the owner changes the password for a shared StyleWriter II and you print without entering the new password, a dialog box appears stating "The password has been changed. Use the chooser to select the printer again".

When you open the Chooser and select the StyleWriter II icon, the printer you were using is highlighted. However, no dialog appears asking you to re-enter the password until you either click the "Get Info" button, double-click the selected printer, or choose another shared StyleWriter II.

Stylewriter: How to set Up as a Network Printer (12/94)

==========

Article Created: 6 January 1993
Article Reviewed/Updated: 12 December 1994

TOPIC ----------

How do I share a StyleWriter or StyleWriter II over a network? How do I print to a shared StyleWriter or StyleWriter II?

DISCUSSION ----------

Overview

Using the StyleWriter II printer driver (which includes GrayShare), you can share your StyleWriter or StyleWriter II with up to 21 additional computers over an AppleTalk network. There is no limit on how many people choose the printer in the Chooser, but only 21 people can print to the printer at a time. Anyone who wants to print to the shared printer needs to install the StyleWriter II printer driver. In order to print to a networked printer from a Macintosh using System 6, you must have System 6.0.7 or 6.0.8 installed, and use MultiFinder.

You still retain control of the printer after sharing it because the StyleWriter is connected to your computer. You can turn sharing on or off at any time. You can also use the Print Monitor program to view a list of pending print jobs and delete any jobs from that list.

Note: The Macintosh connected to the shared printer slows down when other users print to the shared printer because your computer is actually being used as a spooler. The information is sent from the remote computer to yours, then from your computer to the printer.

The StyleWriter printer can only use GrayShare if you use the StyleWriter II software instead of the original StyleWriter software. A GrayShare update disk is available through online services Apple publishes software updates on.

Sharing a Printer

To share a StyleWriter or StyleWriter II with others, follow these steps:

1) In order to share a printer, you must be connected to an AppleTalk network of some type.

   LocalTalk Connection

   The LocalTalk connector goes into the printer port. The peripheral 8 cable (serial cable) connects the printer to the Macintosh. It needs to go into the modem port.

   Ethernet or Token Ring Connection

   Since both Ethernet and Token Ring connections don't require you to use a serial port on your Macintosh, you can use either the printer or modem port to connect the printer to your Macintosh.

2) Open the Chooser and select the StyleWriter II icon.
   A list of available printers displays.

3) Click the icon of the port to which your printer is connected. If you are using the printer port to connect your Macintosh to the network, you must connect your StyleWriter or StyleWriter II to the modem port.

4) Click the Setup button to open the StyleWriter II Sharing Setup dialog box.

5) Place an X in the "Share this Printer" checkbox. You have the option of naming your printer and entering a password. If you type a password for the printer, only users who know the password can use the printer from their computers.

   If you want a record of what is printed on your printer, place an X in the "Keep Log of Printer Usage" checkbox.

6) Click "OK" to close the StyleWriter II Sharing Setup dialog box and close the Chooser window.

Your printer is now available to others on the network.

Printing to a Shared Printer

To print to a shared printer, follow these steps:

1) Open the Chooser and select the StyleWriter II icon. A list of available printers and communications ports will be displayed.

2) Click the name of the shared printer that you want to use.
   If the printer requires a password, a dialog box appears in which you must type the password.

3) Optionally, you may click the Get Info button to see whether any fonts in your system are unavailable on the shared printer. If your documents contain such fonts, printing will be slower, because the fonts must be downloaded to the printer.

4) Close the Chooser

You are now ready to print to the shared printer.

StyleWriter II: Using Overseas

Revised: 1/5/93
Security: Everyone

StyleWriter II: Using Overseas

==========

Article Created: 6 January 1993

TOPIC ----------

Can I take my U.S./Japan version StyleWriter overseas?

DISCUSSION ----------

The StyleWriter II power supply is built in to the printer, unlike the original StyleWriter which had an external power transformer.

Two Versions

The StyleWriter II is manufactured in two versions:

- The U.S./Japan version uses 100 to 120 volt power at 48 to 62 Hertz.
- The European version uses 220 to 240 volt power at 48 to 62 Hertz.

Using In Another Country

- To use a U.S./Japan model StyleWriter II in Europe, you must use an isolation step-down transformer to reduce the electrical voltage.
- To use a European model in the U.S. or Japan, you must use a isolation step-up transformer.

StyleWriter II: Description

Revised: 1/5/93
Security: Everyone

StyleWriter II: Description

==========

Article Created: 6 January 1993

TOPIC ----------

This article describes the Apple StyleWriter II Printer

DISCUSSION ----------

The Apple StyleWriter II Printer provides laser-quality print at 360 dpi (dots per inch) using thermal ink-jet technology. The StyleWriter II works with any Macintosh that has at least 1MB of memory and a hard disk drive and uses System Software 6.0.7 or later.

The StyleWriter II comes with 39 TrueType fonts, including Times, Helvetica, Palatino, ITC Avant Garde Gothic, and Symbol.

The StyleWriter II has a multipurpose paper feeder that automatically feeds up to 15 envelopes or 100 sheets of paper. To handle diverse printing requirements, the StyleWriter II accommodates letterhead, labels, envelopes, and transparencies for overhead projection.

Apple's GrayShare technology gives your StyleWriter II the ability to print over 130 shades of gray and allows you to connect your StyleWriter II to a network through your Macintosh.

Print quality

- 360 dpi for laser-quality printing
- Grayscale printing for sharp graphics
- 39 scalable TrueType fonts for printing in any size and a wide range of styles

Convenience

- Small, sleek design fits on any desktop
- Multipurpose tray for effortless paper feeding
- Ideal for home use
- Fast draft-mode printing

Ease of Use

- Easy, one-click software installation
- Plug-and-play simplicity with any Macintosh computer
- 100-sheet multipurpose tray with automatic envelope feeder
- Draft, Normal, and Best print modes for versatility and productivity

StyleWriter II: Specifications (7/95)

==========

Article Created: 6 January 1993
Article Reviewed/Updated: 26 July 1995

TOPIC ----------

This article provides specifications for the Apple StyleWriter printer.

DISCUSSION ----------

Marking Engine

• Thermal ink jet

Memory

• 128K (62K used for buffer)

Speed

• Best mode: up to one page per minute
• Normal and draft: up to two pages per minute (actual speed varies depending on images printed and computer used)

Print Quality

• 360 dpi in best and normal modes
• 180 dpi in draft mode
• Grayscale printing with GrayShare software

Fonts

• 39 TrueType fonts from the following font families: ITC Avant Garde Gothic, ITC Bookman, Chicago, Courier, Geneva, Helvetica, Helvetica Narrow, Monaco, New Century Schoolbook, New York, Palatino, Symbol, Times, ITC Zapf Chancery, ITC Zapf Dingbats

Interface

• High-speed serial (RS-422)

Ink Cartridge

• User-replaceable
• Up to 500 pages at 5% page coverage

Paper Feed

• Automatic up to 100 sheets (fewer sheets if heavier paper is used) or 15 envelopes

Print materials

• Apple recommends 20-lb. (75 g/m2) cotton bond; also accepts 16-lb. (60 g/m2) to 24-lb (90 g/m2) paper
• Paper sizes: U.S. letter, U.S. legal, A4
• Most letterhead and colored stock, labels, envelopes, and transparencies
• Envelopes: #10 business, monarch, and other sizes
• Apple recommends 3M brand CG3480 transparency film

Paper capacity

• Multipurpose tray: up to 100 sheets of 20 lb. paper (fewer sheets if heavier paper is used) or 15 envelopes

Printable surface

• Maximum printable line: 8.0 in. (203.2 mm)
• Minimum margins: 0.25 in. (6.35 mm)

Size and weight

• Height: 7 in. (18 cm)
• Width: 13.6 in. (34.5 cm
• Depth with output tray closed: 7.9 in. (20 cm)
• Weight: 6.6 lb. (3 kg.)

Power requirements

• U.S. and Japan: 100 to 120 VAC, 48 to 62 Hz
• Europe and Australia: 220 to 240 VAC, 48 to 62 Hz

Power consumption

• 19.5 W maximum at 120 V
• 18 W maximum at 220 V

System requirements

• Any Apple Macintosh personal computer with at least 1MB of RAM and a hard

disk drive
- System software version 6.0.7 or later
- Recommended: 2MB or more RAM with System 6.0.7 or 6.0.8
  4MB or more RAM with System 7 or later

Article Change History:
26 Jul 1995 - Clarified paper capacity
16 May 1995 - Corrected paper capacity; reformatted.

LaserWriter Pro 630: Description (5/96)

Revised: 6/4/96
Security: Everyone

LaserWriter Pro 630: Description (5/96)

==========

Article Created: 6 January 1993
Article Reviewed/Updated: 30 May 1996

TOPIC ----------

This article describes the Apple LaserWriter Pro 630 printer.

DISCUSSION ----------

The Apple LaserWriter Pro 630 is a compact, expandable network printer that makes use of Apple's FinePrint and PhotoGrade technology. With PhotoGrade, the LaserWriter Pro 630 can print more than 91 levels of gray, while FinePrint smooths curves and jagged text. The LaserWriter Pro 600 can also print documents at 600 dpi (dots per inch).

LocalTalk allows for plug-and-play connection to an AppleTalk network system, as well as parallel and serial ports for connection to DOS and Windows computers. You can also connect to high-speed Ethernet networks with built-in Ethernet. SCSI ports are available so you can connect an internal or external hard drive for large-capacity font storage. All ports stay active, so you can send documents to any port without having to change a single setting.

The LaserWriter Pro 630 comes with two paper trays and options that include a 500-sheet paper cassette and a 75-envelope feeder. That brings total paper capacity to 850 sheets.

LASERWRITER PRO 630 FEATURES

Print Quality

- 600 dpi resolution for high-quality text
- PhotoGrade for enhanced images at 300 dpi with FinePrint for smooth text and lines

Multiplatform Compatibility

- Simultaneous connection to Ethernet, LocalTalk, Centronics parallel, and RS-232 serial ports
- Simultaneous connection to Macintosh, MS-DOS, and Windows computing environments
- SCSI ports (internal and external) for hard drive connection and font storage
- Adobe PostScript Level 2 software and HP LaserJet IIP (PCL 4+) emulation

Convenience and flexibility

- Two paper trays included (100 and 250 sheet capacity)
- Optional envelope feeder (75-envelope capacity)
- Optional 500-sheet feeder
- Maximum capacity with options: 850 sheets

Power and speed

- 25-MHz 68030 microprocessor, plus ASICs and I/O processors
- Ethernet port for direct connection to EtherTalk networks

Memory

- 8MB of RAM, expandable to 32MB
- 2MB of ROM

This article gives the technical specifications for the Apple LaserWriter Pro 630 printer.

DISCUSSION ----------

Marking Engine

• Canon EX laser

Controller

• 25-MHz 68030 CPU, ASICs, and I/O processors

Memory

• 8MB of RAM, expandable to 32MB
• 2MB of ROM

Speed

• Eight pages per minute maximum

Print Quality

• 300 dpi resolution enhanced with FinePrint or PhotoGrade
• 600 dpi resolution

Fonts

- Apple Font Library: 64 fonts total.
- 35 fonts in ROM from the following font families: Avant Garde, Bookman, Courier, Helvetica, Helvetica Narrow, New Century Schoolbook, Palatino, Symbol, Times, Zapf Chancery, and Zapf Dingbats.
- 29 fonts on Macintosh disk from the following font families: Chicago, Delphian, Garamond Narrow, Geneva, Helvetica Black, Helvetica Compressed, Lubalin Graph, Lucida Bright, Machine, Monaco, Nadianne, New York, Old English Text, Onyx, Oxford, Swing, and Zeal.
- Any TrueType or PostScript fonts.

Interfaces

- Simultaneous connection to Ethernet, LocalTalk, RS-232 serial, and Centronics parallel interfaces.
- Internal and external SCSI ports for hard disk font storage.

Recommended Duty Cycle

- Toner cartridge: 6,000 pages at 5% density
- Printer: minimum 450,000 pages

Print Materials

- Media: 20- to 24-lb. (75 to 90 g/m2) from cassette; up to 32-lb. (120 g/m2) with manual feed.
- Paper: U.S. letter, U.S. legal, A4, B5.
- Labels, envelopes, most textured stock, and transparencies.

Paper Capacities

- Standard
  - 100-sheet multipurpose tray (also holds up to 10 envelopes)
  - 250-sheet letter cassette
- Optional
  - 500-sheet feeder
  - envelope feeder: up to 75 envelopes

Printable Surface

- Maximum printable line: 8.1 in. (205.9 mm)
- Minimum left and right margins: 0.1379 in. (3.5 mm)
  Minimum top margin: 0.114 in. (2.9 mm)
  Minimum bottom margin 0.197 in. (5.0 mm)

Size and Weight

- Height: 12.1 in. (30.8 cm)
- Width: 16.8 in. (42.5 cm)
- Depth: 16.9 in. (42.9 cm)
- Weight: 39 lb. (17.7 kg)

Power Requirements

- U.S. and Japan: 90 to 110 VAC, 58 to 62 Hz, 103.5 to 126 VAC, 58 to 62 Hz
- Europe and Australia: 194 to 264 VAC, 48 to 52 Hz

Power Consumption

- Standby: 95 W average
- Operating:
  — 560 W maximum at 115 V
  - 530 W maximum at 220 V

LaserWriter Pro 630: SCSI Ports (5/95)

Revised: 5/1/95
Security: Everyone

LaserWriter Pro 630: SCSI Ports (5/95)

==========

Article Created: 6 January 1993
Article Reviewed/Updated: 1 May 1995

TOPIC ----------

This article describes the SCSI ports of the Apple LaserWriter Pro 630 printer.

DISCUSSION ----------

The LaserWriter Pro 630 printer has an internal and an external SCSI port so a user can attach SCSI hard disk drives for extra font storage.

The external SCSI port uses an Apple HDI-30 connector instead of the 25-pin DB-connector used on the LaserWriter II series. This SCSI connector is placed several inches from the bottom of the printer; most hard drives will require a SCSI cable extender in addition to an Apple HDI-30 SCSI System Cable (Apple Part Number M2538LL/A) to rest in their normal position.

Note that external SCSI drives that are connected to a LaserWriter Pro 630 must have an Apple SCSI Cable Terminator II (Apple Part Number (M5871G/A) at the end of the SCSI chain. This terminator is black and is the same type of terminator used with the Macintosh IIfx, LaserWriter IIf and IIg. If the wrong SCSI terminator is used, attached hard drives may not be recognized.

There is also a 40-pin internal SCSI port that accommodates an internal 2.5-inch SCSI hard drive. You do not need to attach a SCSI terminator to an internal hard disk.

Both SCSI ports are meant for media use only and can not be used for connecting the printer to a computer.

Users can attach up to seven SCSI hard disks to the LaserWriter Pro 630. The LaserWriter Pro 630 recognizes only those drives that have been formatted for use with a LaserWriter IIf, IIg, or drives that have been initialized using the LaserWriter Utility.

Article Change History:
01 May 1995 - Corrected reference to LaserWriter Pro 600.
26 Mar 1993 - Updated to give more information about the SCSI Terminator.

Communications ToolBox: Basic Connectivity Set 1.1.1

Revised: 1/15/93
Security: Everyone

Communications ToolBox: Basic Connectivity Set 1.1.1

==========

Article Created: 4 January 1993

TOPIC ----------

This article describes the Communications ToolBox, Basic Connectivity Set 1.1.1 (released on January 4, 1993), which has a new XMODEM Tool and Serial Tool.

DISCUSSION ----------

The Communications ToolBox, Basic Connectivity Set 1.1.1 contains a revised XMODEM Tool with many important bug fixes, and a new Serial Tool. It's readily available to those needing it, as it is posted on AppleLink and internet.

Availability

The disk image is posted on AppleLink. Here's the path:

Software Sampler
  Apple SW Updates
    Macintosh
      Networking and Communications
        Communications ToolBox Tools

It's also available over the internet from, ftp.apple.com.

Users of the XMODEM tool can also contact the manufacturer of their application -- the one that provided the original XMODEM tool -- for an Update.

Officially, Apple has shipped the Communications ToolBox, Basic Connectivity Set with only one retail product -- MacTerminal 3.0 -- and through APDA.

Many third parties, for example Microsoft, Claris, Pacer, and White Pine, have

distribution licenses for the software. They are bound by contract to make the software available to their customers (but not necessarily free of charge).

Installation Instructions

If you received an image file, create an install disk. Then with the Basic Connectivity Set install disk:

- On Macintosh computers running System 7, drag the Communications ToolBox tools from the Basic Connectivity Set disk into the (closed) System Folder. When a dialog box tell you the tools need to be installed in the Extensions folder, click yes.

- On Macintosh computers running System 6, locate the Communications Folder stored in the System Folder. Drag the Communications ToolBox tools from the Basic Connectivity Set disk into this folder.

Bug Fixes and Features

Here are the features of the new software on the disk.

XMODEM Tool 1.1

XMODEM Tool 1.1 has been improved over the XMODEM Tool 1.0.2 in the following ways:

- Improved reliability. The XMODEM Tool 1.1 is less susceptible to protocol violations, line-noise, and corrupted bytes.

- Performance increase of up to 400%.

- In a few cases when transferring files with XMODEM Tool 1.0.2, the tool would not wait correctly for the receiver to acknowledge the successful receipt of a block. XMODEM Tool 1.1 fixes this problem.

- In System 7, support for creating a new folder when saving a downloaded file using Straight XMODEM or XMODEM Text transfers.

- With the XMODEM Tool 1.0.2, a dialog claiming that there wasn't enough disk space to receive a file would appear when receiving with the MacBinary method, IF the actual data received wasn't MacBinary. Now when non-MacBinary data arrives, the transfer switches to Straight XMODEM.

Serial Tool 1.0.2

When using the Serial Port Arbitrator included with AppleTalk Remote Access, a Serial Tool 1.0.1 dialog box would inform the user that the selected serial port was in use, even when no other service was using the port. The only way to override the "busy port" dialog was to hold down the Option key.

The Serial Tool 1.0.2 properly allows the access to the serial port when the Serial Port Arbitrator is installed and the serial port is not in use by another service.

DAM: Handling a Query That Returns Multiple Tables

Revised: 1/21/93
Security: Everyone

DAM: Handling a Query That Returns Multiple Tables

==========

Article Created: 4 January 1993

TOPIC ----------

I'm thinking of implementing a DAM (Data Access Manager) extension to manage a custom communication API. It appears that DAM supports the notion of tabular query results (for example, GetQueryResults returns a structure that describes a "table" -- the number of columns/rows returned, the datatype of each column is returned).

Can DAM handle a query that returns multiple tables? It seems that this would involve multiple GetQueryResults calls. Do applications that work with Query Documents fetch all of the tables? How would my extension's DBGetItem function indicate the end of a table?

I remember hearing talk about Sybase and EDAsql using DAM. Both of these architectures model the concept of a single query returning multiple tables.

DISCUSSION ----------

DAM is constrained by the limitations of SQL (Structured Query Language). SQL views all data in "table" format. That is, it sees everything as rows of columns that contain the actual data.

Data is kept in relational databases (the kind of databases that are accessed by SQL) in "Tables". These tables are defined as having specific, named columns. Each column contains data of a specific data type. These "real" tables are created by specific Data Definition Language (DDL) statements and are then filled with data via either batch jobs, or on-line transactions.

When you do an SQL query (regardless of how you do that query, DAM or the database's own query tool), you are requesting the DBMS to extract data from

one or more columns, from one or more tables. The result of that query will always be a single "logical table" containing none, one, or more rows of the requested columns.

There will never be more than one "logical table" returned with one query command (that is, Select statement). If you wish to have multiple "logical tables" of data returned, you must make multiple queries, retrieving and storing the returned data after EACH query.

An application should be written such that it sends a query, then retrieves the data from the results "logical table", and finally checks for end-of-data. (Chapter 8 of Inside Macintosh, Volume VI goes into detail about using DAM. The result code of the DBGetItem API call will tell you when you have reached the end of the results "logical table".)

In summary, data can be returned from relational databases in many ways and multiple times, but only one set (or "logical table") of data can ever be returned at one time from any query.

System 7: Memory Protection

Revised: 1/6/93
Security: Everyone

System 7: Memory Protection

==========

Article Created: 6 January 1993

TOPIC ----------

What is Apple's position on the present capability and future plans to address memory protection under System 7?

DISCUSSION ----------

There's a booklet available to the general public from Apple named "BluePrint for the Decade" that partially addresses this issue, but gives no specific timeframes. The booklet, created in October 1991, is a 26-page outline of Apple's product strategy for the coming decade. Here's some text regarding this specific issue. If you'd like a copy of the booklet, call the Apple Customer Assistance Center.

BluePrint for the Decade - An overview of Apple technology and strategies
---
(From page i)

"In the 1990s, Apple will expand its role in both personal computing and enterprise computing. This will be driven by a focused product strategy that provides:

- Rapid advances in our System 7 software architecture.
- An object-oriented operating system that will revolutionize the economics of software development for enterprise computing, code-named Pink."

(From page 5: "The Future of System 7:Enhanced Operating System")

"We are at work on new operating-system services that will complement the multitasking capabilities in System 7 and give users smoother operation and

greater reliability. Services planned include preemptive multitasking, multithreaded routines, memory protection at the process and kernel level, and asynchronous and concurrent I/O."

UNIX: Running Macintosh Software (4/95)

Revised: 4/26/95
Security: Everyone

UNIX: Running Macintosh Software (4/95)

==========

Article Created: 5 January 1993
Article Reviewed/Updated: 26 April 1995

TOPIC ----------

I need a list of products that run the Macintosh OS (Mac OS) on UNIX machines.

DISCUSSION ----------

UNIX-based workstations from Hewlett Packard (HP) and Silicon Graphics Inc. can run Apple Macintosh applications under agreements made with Xcelerated Systems Inc. and Quorum Software Systems.

Liken

HP offers Xcelerated's Liken, emulation software that brings the Macintosh environment to a RISC workstation (Precision Architecture) running X windows.

Liken brings the whole Macintosh environment, including support for control panels and utilities, to the workstation. Users can expect about the same level of performance as the Macintosh demonstrates.

The only incompatibility Liken has with the Macintosh is that it doesn't support low-density floppy disks, because they aren't found on UNIX workstations.

Latitude

Quorum Latitude, is available on Silicon Graphics UNIX workstations. With Latitude, a user can recompile a Macintosh application to run in a native fashion on a UNIX workstation running either a Motif or an Open Look graphical user interface. In essence, Quorum works by converting Macintosh applications into UNIX applications.

The core technology behind Latitude is a portable implementation of the Macintosh application programming interface layered on top of the UNIX operating system.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

LaserWriter Pro 600 and 630: Differences

Revised: 1/4/93
Security: Everyone

LaserWriter Pro 600 and 630: Differences

==========

Article Created: 6 January 1993

TOPIC ----------

This article describes the differences between the LaserWriter Pro 600 and the LaserWriter Pro 630. The printers differ only in terms of RAM and ports.

DISCUSSION ----------

Memory

- The LaserWriter Pro 600 has 4MB of built-in memory, and ships with a 4MB PhotoGrade Memory Kit which, after dealer installation, gives the printer 8MB of memory.

- The LaserWriter Pro 630 has 8MB of memory built in.

With 8MB of memory, both printers can use PhotoGrade at 300 dpi (dots per inch) and can print at 600 dpi.

Other Features

The LaserWriter Pro 630 has two extra features that the LaserWriter Pro 600 doesn't have.

- The 630 has a built-in Ethernet communications port that allows faster data transmission from the computer to the LaserWriter Pro 630 and may help documents print faster.

- The 630 also has internal and external SCSI ports that allow the user to attach SCSI hard disks for storage of additional fonts.

LaserWriter Pro 600: Description (Discontinued)

==========

Article Created: 6 January 1993
Article Reviewed/Updated: 30 May 1996

TOPIC ----------

This article describes the Apple LaserWriter Pro 600 printer.

DISCUSSION ----------

The Apple LaserWriter Pro 600 is a compact, expandable network printer that makes use of Apple's FinePrint technology. With the PhotoGrade Upgrade Kit, the LaserWriter Pro 600 can use PhotoGrade to print more than 91 levels of gray and can print documents at 600 dpi (dots per inch).

LocalTalk allows for plug-and-play connection to an AppleTalk network system, as well as parallel and serial ports for connection to DOS and Windows computers. All ports stay active, so you can send documents to any port without having to change a single setting.

The LaserWriter Pro 600 comes with two paper trays and options that include a 500-sheet paper cassette and a 75-envelope feeder. That brings total paper capacity to 850 sheets.

LASERWRITER PRO 600 FEATURES

Print quality

• 300 dpi with FinePrint for smooth text

The PhotoGrade Upgrade Kit adds:
• 300 dpi printing with PhotoGrade for superior images and graphics
• 600 dpi for high-quality text

Multiplatform compatibility

- Simultaneous connection to LocalTalk, parallel, and serial ports
- Simultaneous connection to Macintosh, MS-DOS, and Windows computing environments
- Adobe PostScript Level 2 software and HP LaserJet IIP (PCL 4+) emulation

Convenience and flexibility

- Two paper trays included (100 and 250 sheet capacity)
- Optional envelope feeder (75-envelope capacity)
- Optional 500-sheet feeder
- Maximum capacity with options: 850 sheets

Power and speed

- 25-MHz 68030 microprocessor, plus ASICs and I/O processors

Memory

- 4MB of RAM, plus 4MB PhotoGrade Memory Kit, for a total of 8MB. Expandable to 32MB
- 2MB of ROM

Ordering Information

Apple LaserWriter Pro 600 with 4MB PhotoGrade Kit
Order No. B0018LL/A

- Apple LaserWriter Pro 600 printer
- 4MB PhotoGrade Memory Kit (dealer installation required)

LaserWriter Pro 600: Specifications (Discontinued 10/93)

==========

Article Created: 6 January 1993
Article Reviewed/Updated: 21 March 1994

TOPIC ----------

This article gives the technical specifications for the Apple LaserWriter Pro 600 printer.

DISCUSSION ----------

Marking Engine

• Canon EX laser

Controller

• 25-MHz 68030 CPU, ASICs, and I/O processors

Memory

• 4MB of RAM built-in and 4MB PhotoGrade Memory Kit (dealer-installed), for a total of 8MB. Expandable to 32MB.
• 2MB of ROM

Speed

• Eight pages per minute maximum.

Print Quality

• 300 dpi resolution enhanced with FinePrint
• PhotoGrade Kit enables PhotoGrade grayscale printing or 600 dpi

Fonts

- Apple Font Library: 64 fonts total.
- 35 fonts in ROM from the following font families: Avant Garde, Bookman, Courier, Helvetica, Helvetica Narrow, New Century Schoolbook, Palatino, Symbol, Times, Zapf Chancery, and Zapf Dingbats.
- 29 fonts on Macintosh disk from the following font families: Chicago, Delphian, Garamond Narrow, Geneva, Helvetica Black, Helvetica Compressed, Lubalin Graph, Lucida Bright, Machine, Monaco, Nadianne, New York, Old English Text, Onyx, Oxford, Swing, and Zeal.
- Any TrueType or PostScript fonts.

Interfaces

- Simultaneous connection to LocalTalk, RS-232 serial, and Centronics parallel interfaces.

Recommended Duty Cycle

- Toner cartridge: 6,000 pages at 5% density
- Printer: minimum 450,000 pages

Print materials

- Media: 20- to 24-lb. (75 to 90 g/m2) from cassette; up to 32-lb. (120 g/m2) with manual feed.
- Paper: U.S. letter, U.S. legal, A4, B5.
- Labels, envelopes, most textured stock, and transparencies.

Paper Capacities

- Standard
  - 100-sheet multipurpose tray (also holds up to 10 envelopes)
  - 250-sheet letter cassette
- Optional
  - 500-sheet feeder
  - envelope feeder: up to 75 envelopes

Printable surface

- Maximum printable line: 8.1 in. (205.9 mm)
- Minimum left and right margins 0.1379 in. (3.5 mm)
  Minimum top margin 0.114 in. (2.9 mm)
  Minimum bottom margin 0.197 in. (5.0 mm)

Size and Weight

- Height: 12.1 in. (30.8 cm)
- Width: 16.8 in. (42.5 cm)
- Depth: 16.9 in. (42.9 cm)
- Weight: 39 lb. (17.7 kg)

Power Requirements

- U.S. and Japan: 90 to 110 VAC, 58 to 62 Hz, 103.5 to 126 VAC, 58 to 62 Hz

• Europe and Australia: 194 to 264 VAC, 48 to 52 Hz

Power Consumption

• Standby: 95 W average
• Operating:
  — 560 W maximum at 115 V
  - 530 W maximum at 220 V

LaserWriter Pro: Memory Configurations (1/93)

Revised: 2/4/93
Security: Everyone

LaserWriter Pro: Memory Configurations (1/93)

==========

Article Created: 6 January 1993

Article Change History

1/14/93 - CORRECTED
- To show the correct memory specification

1/28/93 - REVISED
- To discuss double-sided memory SIMMs

TOPIC ----------

This article describes the memory configurations of the LaserWriter Pro 600 and LaserWriter Pro 630.

DISCUSSION ----------

The LaserWriter Pro 600 is shipped with 2MB of ROM and 4MB of built-in RAM. When the included 4MB PhotoGrade Kit is added (dealer installation is required), the LaserWriter Pro 600 has 8MB of RAM. The LaserWriter Pro 600 supports these RAM configurations: 4MB, 8MB, 16MB, 20MB, and 32MB.

The LaserWriter Pro 630 is shipped with 2MB of ROM and 8MB of RAM. It supports these RAM configurations: 8MB, 16MB, 20MB, and 32MB.

The LaserWriter Pro 600 and 630 printers use industry standard 72-pin fast mode 80ns memory SIMMs. Each printer has two banks of memory; each bank has one SIMM socket.

Memory Upgrades

When you add memory to a LaserWriter Pro, you must fill Bank A before Bank B. If you have memory SIMMs of two different memory sizes, you must put the SIMM with the greater amount of memory in Bank A.

You may use 4MB, 8MB, or 16MB RAM SIMMs in the LaserWriter Pro printers. All 8MB SIMMs currently produced are considered double-sided SIMMs, since they have memory chips on both sides.

If you have a double-sided SIMM in one memory bank, the other memory bank must be left empty. The second memory bank cannot contain a SIMM.

This is inherent in the design of the LaserWriter Pro I/O Controller board. When a double-sided SIMM is installed in one bank, each side of the SIMM is treated electrically as an individual bank. Since the LaserWriter Pro printers can only have two banks of memory, the second physical bank is unusable and you cannot insert a memory SIMM into it.

Apple manufactures many LaserWriter Pro printers with one double-sided 8MB memory SIMM. To increase memory, you must first remove the 8MB SIMM and then insert the desired memory SIMMs into the printer.

Here are the valid memory configurations for the LaserWriter Pro:

Bank A	Bank B	Total Memory
4MB	Empty	4MB
4MB	4MB	8MB
8MB	Empty	8MB
16MB	Empty	16MB
16MB	4MB	20MB
16MB	16MB	32MB

LaserWriter Pro: Software

Revised: 1/4/93
Security: Everyone

LaserWriter Pro: Software

==========

Article Created: 6 January 1993

TOPIC --------------------

The LaserWriter Pro 600 and LaserWriter Pro 630 include print driver software for both Macintosh and Microsoft Windows.

The following operating systems are supported:
- Macintosh System Software 7.0 and later
- Macintosh System Software 6.0.7
- Microsoft Windows 3.0
- Microsoft Windows 3.1
- MS-DOS 3.1 and later

DISCUSSION --------------------

Macintosh Software

The Macintosh LaserWriter driver has been modified to support the new features of the LaserWriter Pro 600 and 630: 600 dpi and up to four paper input sources. Another feature that has been added is the ability to print one page from one tray (for example, containing letterhead paper) and the rest of the document from a different tray (containing, for example, plain paper). This version of will ship as LaserWriter Driver version 7.2.

The Macintosh LaserWriter Pro software also includes version 7.4 of the LaserWriter Utility.

With the exception of the Installer script, all Macintosh software components are identical between the LaserWriter Pro 600 and the LaserWriter Pro 630.

Microsoft Windows Software

The Microsoft Windows 3.0 and 3.1 drivers allow you to select printer

resolution, paper handling, and grayscale options. PhotoGrade is supported by the Windows drivers.

LaserWriter Utility 7.4: New Features

Revised: 1/4/93
Security: Everyone

LaserWriter Utility 7.4: New Features

==========

Article Created: 6 January 1993

TOPIC ----------

The LaserWriter Pro 600 and LaserWriter Pro 630 printers ship with version 7.4 of the LaserWriter Utility. This article describes the new features of LaserWriter driver version 7.4.

DISCUSSION ----------

Tray Switching

The Tray Switching option allows you to control what happens when a multiple bin printer (such as the LaserWriter Pro 600/630 with the optional second tray installed) runs out of paper during a print job. You can set the printer to continue printing from the next available paper tray, or to stop printing and return an Out of Paper message when the tray being used runs out of paper during a print job.

With tray switching turned on, the LaserWriter Pro 600 and 630 printers can print up to 350 pages at a time using the 250-sheet cassette and the 100-sheet multipurpose tray. With the optional 500-sheet Sheet Feeder installed, tray switching works only between the 250-sheet cassette and the 500-sheet Feeder. This allows printing of up to 750 pages at one time.

The output tray holds a maximum of 250 sheets. You must empty it if you have a print run greater than 250 pages. The paper output tray can be emptied on-the-fly without stopping the printer.

Better Print Quality Settings

LaserWriter Utility 7.4 allows you to select the printer's resolution, and turn FinePrint and PhotoGrade on and off. Additionally, the screen frequency (also known as lines per inch) and angle are displayed for each PhotoGrade

setting. A screen frequency of 106, with a 45 degree angle, is the default setting for PhotoGrade.

Toner Density Control

Unlike the LaserWriter II engine, the LaserWriter Pro 600 and 630 print engine does not have a physical dial for adjusting the toner density. The LaserWriter Utility provide toner density control for the LaserWriter Pro printers.

Apple Color Printer: Paper Loading Instructions

Revised: 1/4/93
Security: Everyone

Apple Color Printer: Paper Loading Instructions

==========

Article Created: 6 January 1993

TOPIC ----------

This article tells you how to load the various types of paper into the Apple Color Printer.

DISCUSSION ----------

The Apple Color Printer's input paper tray holds up to 100 sheets of 20-lb. paper. If you use heavier paper, fewer sheets fit in the input feeder. The Apple Color Printer can hold and automatically feed up to five envelopes. To avoid multiple feeding problems, insert transparencies one at a time.

NOTES:

- Acceptable Paper: 20-lb. cotton bond paper is recommended when using plain paper. The Apple Color Printer can feed 16- to 24-lb. paper.

- Don't mix print material.

- Don't load transparencies, envelopes, and paper in the feeder tray.

A head position lever helps the Apple Color Printer properly feed material through the print mechanism. Leave the head position lever in position 1 when using coated or medium weight plain paper. When printing images with heavy graphics, move the head position lever to position 2. Finally, when using thick paper, envelopes, or transparencies with the Apple Color Printer, move the head position lever to position 3.

Apple Color Printer: Using Print Menus

Revised: 1/4/93
Security: Everyone

Apple Color Printer: Using Print Menus

==========

Article Created: 6 January 1993

TOPIC ----------

Printing with the Apple Color Printer is easy. After you install the GrayShare driver, related software, and fonts via the one-button installer and restart the Macintosh, the Apple Color Printer is ready to use. This article gives you more detail about using Apple Color Printer print menus.

DISCUSSION ----------

To print, select the Print command from the File menu. The print dialog allows you to select the print quality: best or draft.
• Best mode prints at 360 dpi and produces excellent quality output.
• Draft mode is much quicker because it prints at 180 dpi.

The print dialog also provides paper type choices of coated, transparency, or plain. Apple recommends using coated paper for best results.

The Image menu allows you to choose between Color/Grayscale and Black & White printing. Color/Grayscale mode uses GrayShare's advanced halftoning methods to create over one hundred shades of gray or millions of colors. When printing text or black and white images, using Black & White mode is much faster than Color/Grayscale.

The Notification menu allows choosing any notification (Alert or System Beep), if desired, when the print job is complete.

Finally, the Color… button causes the ColorSync dialog to appear and allows\ you to decide which level of color matching is appropriate for a document. If you don't change the color matching default via the Options dialog, it will use faster color matching.

The ColorSync dialog shows these selections:

- Faster Color Matching selection uses quick lookup tables to determine best match colors for replacement of any color that's outside the color gamut of the Apple Color Printer.

- The Best Color Matching selection allows you to influence the color matching process by indicating the type of paper and choosing the matching method (Photographic, Monitor Tint, or Solid Color).

The Printer Profile menu specifies the type of paper used. The Apple Color Printer profile is customized for Apple Color Printer coated paper. If you select Coated in the print dialog, the default printer profile is Apple Color Printer. If you select Transparency or Plain paper in the print dialog, the default printer profile is Automatic.

The Photographic matching method is best for images with many shades and colors or a neutral color (such as white borders). Use the Solid Color matching method for charts, graphs, and any images with large areas of single colors. Use Monitor Tint for images that have large areas of similar colors or shades of one color.

LaserWriter: Preventing Envelopes from Sealing

Revised: 1/15/93
Security: Everyone

LaserWriter: Preventing Envelopes from Sealing

==========

Article Created: 6 January 1993

TOPIC ----------

Occasionally, envelopes seal shut when they're fed through a LaserWriter. During the printing process, the envelope is heated by the fuser, causing the moisture in the envelope to turn to steam. The steam wets the adhesive on the envelope, which seals it.

This article describes one way to prevent envelopes from sealing:

DISCUSSION ----------

1) Obtain a sheet of "baking parchment." This is a treated paper product that resists heat. It's available at grocery stores or specialty cooking stores.

2) Cut a piece of baking parchment to fit inside the envelope, and place it in the envelope so that the "smooth" side of the parchment faces the gummed seal.

3) Fold the envelope flap (with the seal) inside the envelope and print. The parchment should lie between the envelope flap and the inside of the envelope.

4) After printing, remove the parchment and reuse it.

Macintosh Duo Dock: How to Replace Missing or Lost Keys (1/93)

Revised: 5/16/94
Security: Everyone

Macintosh Duo Dock: How to Replace Missing or Lost Keys (1/93)

==========

Article Created: 5 January 1993

TOPIC ----------

This article explains how to get replacement keys for the Macintosh Duo Dock.

DISCUSSION ----------

For security reasons, Apple does not replace individual keys.

Key Missing from Box

If the key is missing from the box of a new Duo Dock, customers should contact the Apple Customer Assistance Center (800-776-2333). The entire Lock Plug (Part Number 922-0108) on the Duo Dock must be replaced. The lock will be sent to the customer's authorized Apple service provider, who can install it.

Lost Key

If the key has been lost, the customer has three options to replace the keys:

- Contact the lock vendor to order a replacement set of keys.
  Fort Lock Corporation
  3000 N. River Road
  River Grove, IL 60171
  708-456-1100

- Have a locksmith make a replacement set of keys.

- Have an authorized Apple service provider replace the Lock Plug (see part number above).

In all cases involving lost keys, the charges for replacement will need to be paid by the customer.

GPi: Some Macintosh Models Do Not Support It (5/96)

Revised: 5/9/96
Security: Everyone

GPi: Some Macintosh Models Do Not Support It (5/96)

==========

Article Created: 6 January 1993
Article Reviewed/Updated: 9 May 1996

TOPIC ----------

We have recently discovered that pin 7 of the serial port on a Macintosh LC II is not connected to the main logic board. This appears to be an intentional design. This causes a problem running a super-fast modem, where the handshaking that the GPi (General Purpose Input) line provides is needed. Is there a way to connect this line, and if so how?

DISCUSSION ----------

Some Macintosh models use a custom Apple chip (the Apple Combo Chip) for serial communication functions. The chip combines the functions of the 8550 (SCC) and the 53C80/53C96 (SCSI) into a single chip. This chip does not have GPi capabilities, so the computers that use it have no GPi functionality.

The Macintosh Models Affected

- Classic, Classic II, Color Classic
- Macintosh LC, LC II, LC III, LC 475, LC 520, LC 57x family
- Performa 200, 400, 405, 430, 450, 600
- Macintosh IIsi
- Macintosh IIvx, IIvi
- Quadra 605
- Macintosh 630 family
- Macintosh PowerBook family

The following computers are in the Macintosh 630 family: Performa 630, Performa 635, Performa 636, Performa 637, Performa 638, LC 630, and Quadra 630.

Article Change History:

Apple Adjustable Keyboard: Specifications (Discontinued) (5/95)

==========

Article Created: 6 January 1993
Article Reviewed/Updated: 16 May 1995

TOPIC ----------

This article gives the technical specifications of the Apple Adjustable Keyboard.

DISCUSSION ----------

Compatibility

- Plugs directly into any Apple Desktop Bus port on your Macintosh
- Requires Macintosh system software version 6.0.7 or later

General

- Total number of keys: 111 (ANSI), 112 (ISO)
- Required voltage: 5 ± 10% V DC
- Storage temperature: –40° to 116.6° F (–40° to 47° C)
- Operating temperature: 50° to 104° F (10° to 40° C)
- Operating humidity: 95% maximum, noncondensing at 77° to 104° F (25° to 40° C)
- Two cables: 3-ft. (1.0 m) coiled cord and 13.4-in. (340 mm) cable
- Total weight: 3 lb. 12 oz. (1.7 kg) keyboard and keypad with palm rests

Characteristics of Typing Keys

- Typical distance between keys: 0.75 in. (19.05 mm)
- Total key travel: 0.138 in. (3.5 mm)
- Peak tactile force: 0.69 ± 0.25 N
- Travel to peak tactile force: 0.06 + 0.008/–0.016 in. (1.5 + 0.2/–0.4 mm)
- Keyswitch minimum life: 10 million cycles

MAIN KEYBOARD

Keyboard Array

- ANSI version: 68 keys total (47 printing keys)
- ISO version: 69 keys total (48 printing keys)
- Escape key
- Power-on key
- Volume up, volume down, mute, and record keys
- Green LED indicator for Caps Lock
- Two ADB 4-pin minicircular connectors

Size and Weight

- Height (rear): 1.48 ± 0.04 in. (37.5 ± 1 mm) with flip feet closed
- Width: 15.18 in. ± 0.04 in. (385.6 ± 1 mm)
- Depth: 6. 26 in. ± 0.04 in. (159 ± 1 mm)
- Weight: 2 lb. 5 oz. (1.055 kg) without palm rests; 2 lb. 7 oz. (1.223 kg) with palm rests

Keyboard Slope

- 5° with flip feet closed; 12.5° with flip feet open

Keyboard Opening Angle

- 30° maximum, 0° minimum

Height of Home Row

- 1.77 in. (30 mm) minimum

Power Requirements

- LED off: 7 mA
- LED on: 19 mA

EXTENDED KEYPAD

Keypad Array

- 43 keys total
- 18-key numeric keypad
- 15 function keys
- Four cursor-control keys in inverted-T layout
- Six special screen-editing keys
- Two ADB 4-pin minicircular connectors

Size and Weight

- Height: 1.48 ± 0.04 in. (37.5 ± 1 mm) with flip feet closed
- Width: 9.78 ± .04 in. (248.3 ± 1 mm)
- Depth: 5.66 ± .04 in. (143.7 ± 1 mm) front to back
- Weight: 14 oz. (.405 kg) without palm rest; 1 lb. 1 oz (.481 kg) with palm rest

Power Requirements

- Maximum: 7 mA

Apple Adjustable Keyboard: Description (Discontinued) (5/95)

==========

Article Created: 6 January 1993
Article Reviewed/Updated: 16 May 1995

TOPIC ----------

This article describes the Apple Adjustable Keyboard.

DISCUSSION ----------

The Apple Adjustable Keyboard has a new ergonomic design that helps your wrists stay in a neutral position for comfort and typing ease. Its main feature is a "split" alphanumeric keyboard that lets you adjust the left- and right-hand sections up to a 30-degree angle to find the typing position that feels right for you.

The Apple Adjustable Keyboard also includes:

- Detachable palm rests to provide a flat surface to rest your hands when you’re not typing.
- Volume up, volume down, mute, and record keys, valuable in multimedia applications.
- A separate extended keypad that includes function keys, special keys for document editing, a numeric keypad, and cursor-control keys
- Adjustable feet so you can change the slope of both the main keyboard and the extended keypad.

APPLE ADJUSTABLE KEYBOARD FEATURES

Ergonomic Design

- Split alphanumeric keyboard
- Detachable palm rests

- Slope-adjustment feet

Modularity

- Separate extended keypad can be located on either the right or left side of the keyboard
- Detachable palm rests for minimum desk space requirements

Ease of Use

- Standard ANSI layout eliminates the need to relearn the positions of the keys (ISO layout available for Europe)
- Easily accessible sound keys to modify the sound volume or record without lifting your hands from the keyboard
- Easy connection with any Macintosh through the Apple Desktop Bus port

Flexibility

- Full-featured keyboard for complete compatibility with Macintosh applications
- 111 total keys with 15 function keys and an 18-key numeric keypad

Ordering Information

Apple Adjustable Keyboard
Order No. M1242LL/A

- Main alphanumeric keyboard
- Two keyboards palm rests (left and right)
- Extended keypad
- Keypad palm rest
- Keypad template
- 3-ft. ADB coiled cable
- 1-ft. ADB jumper cable
- 3.5-in. floppy installer disk
- Instruction manual
- Software license agreement and warranty

Apple Desktop Bus Mouse II: Description and Specifications

Revised: 1/6/93
Security: Everyone

Apple Desktop Bus Mouse II: Description and Specifications

==========

Article Created: 6 January 1993

TOPIC ----------

This article describes and gives specifications for the Apple Desktop Bus Mouse II.

DISCUSSION ----------

Description

The Apple Desktop Bus Mouse II has a sleek, rounded, ergonomic shape that makes it comfortable to grab and move objects on screen.

- The mouse button is enlarged to make clicking and dragging easier.

- The tracking ball is located in the front of the mouse, for more precise control when doing precision work.

The low-power Apple Desktop Bus Mouse II uses the ADB interface and works with all Apple II and Macintosh computers with an ADB interface.

FEATURES

Ergonomic design

- Rounded shape
- Large single-button design
- Forward ball placement for fine movements with less effort
- A complete ergonomic solution when used with the Apple Adjustable Keyboard

Flexibility

- Can be daisy-chained directly from any other ADB device or plugged directly into an ADB port on your computer
- Low power consumption for PowerBook use

Ordering Information

Apple Desktop Bus Mouse II
Order No. M2706LL/A

TECHNICAL SPECIFICATIONS

System Requirements

- Any Macintosh or Apple II computer with an Apple Desktop Bus interface

Tracking

- Mechanical

Shaft Encoding

- Optical
- 200 pulses per in. (7.87 per mm)

Power Consumption

- Maximum: 10 mA

Size and Weight

- Height: 1.3 in. (33 mm)
- Width: 2.4 in. (62 mm)
- Depth: 4.2 in. (106 mm)
- Weight: 0.29 lb. (0.13 kg)

StyleWriter and StyleWriter II: Differences

Revised: 1/13/93
Security: Everyone

StyleWriter and StyleWriter II: Differences

==========

Article Created: 6 January 1993

TOPIC ----------

What are the differences between a StyleWriter and a StyleWriter II?

DISCUSSION ----------

Here are the primary differences between the StyleWriter and StyleWriter II printers (the original StyleWriter cannot be upgraded to a StyleWriter II):

	StyleWriter	StyleWriter II
Memory	64K	128K
Speed:		
• Best Mode	1/2 page per minute	Up to 1 page/minute
• Faster/Draft Mode	Up to 1 page/minute	Up to 2 pages/minute
Print Quality:		
• Best Mode	360 dpi (dots per inch)	360 dpi
• Faster/Draft Mode	180 dpi (dots per inch)	180 dpi
Grayscale Printing	No	Over 130 grayscales with GrayShare software
Paper Capacity	50 sheets	100 sheets, 15 envelopes
Printer Sharing	No	Yes, with GrayShare software
Construction	Separate sheet feeder and print mechanism	Sheet feeder and print mechanism in one unit

DAL: AS/400 and SQL/400 Runtime Libraries

Revised: 1/21/93
Security: Everyone

DAL: AS/400 and SQL/400 Runtime Libraries

==========

Article Created: 6 January 1993

TOPIC -----

Do I only need the SQL/400 run-time libraries to use the DAL Server on an AS/400? Do I have any limitation on using DAL -- in this case, comparing to use it with SQL/400 product (for example I couldn't delete or update the data in the base)?

DISCUSSION -----

You need the SQL/400 runtime libraries only if you wish to use the Data Access Language for the AS/400 Server in a read-only manner.

But to be able to update and delete, you need the full SQL/400 product, and the journal facility must be turned on for the table(s) in the database which you wish to update.

DAL: SQL/400 Needed for Updating AS/400 Database

Revised: 1/21/93
Security: Everyone

DAL: SQL/400 Needed for Updating AS/400 Database

==========

Article Created: 6 January 1993

TOPIC ----------

Concerning DAL for AS/400: will I ever need SQL/400 in addition to the DAL server installed on the target AS/400 to access the database using a DAL application?

DISCUSSION ----------

The runtime libraries that come with the OS/400 operating system for an AS/400 give you enough to be able to access data in a read-only manner. The data can have been created in SQL/400, or in flat files (created via DDS or IDDU).

If you wish to do updates, then the SQL/400 licensed product is required. In addition, journaling has to be turned on for the individual dataset within SQL/400.

Unlike all the other DAL Servers, this server can use the feature of SQL/400 that allows access to files that are created via SQL/400 (known as SQL Collections) -- as well as access to flat files created via other methods available on the AS/400, such as DDS or IDDU (files created by these methods are kept in Libraries).

Apple Logo in Menu Bar: Black, Grays, and Color

Revised: 1/7/93
Security: Everyone

Apple Logo in Menu Bar: Black, Grays, and Color

==========

Article Created: 7 January 1993

TOPIC --

Why does the Apple logo in the Macintosh menu bar show up in black on the PowerBook Duo 210/230 when the Monitors control panel is set to 16 grays, but in a gray-shaded Apple logo when the Monitors control panel is set to color?

DISCUSSION --

The PowerBook Duo 210/230 support both color and gray in Monitors, and up to 16 shades of gray.

- When you have Monitors set to Gray, the Apple menu icon is always completely black, no matter what gray level you set. This is because a shades-of-gray Apple logo wouldn't follow Apple's official logo guidelines.

- When you set Monitors to color, the logo is black when in four-color mode for the same reason: a four-color logo doesn't fit within the logo guidelines.

- The logo appears in color when the Monitors control panel is set to 16 colors.

When you set the software to color, it assumes that the display is color, and with the built-in QuickDraw routines, produces a shaded Apple logo on a monochrome screen.

DAL: VTAM and Teradata Database Error Messages

Revised: 1/21/93
Security: Everyone

DAL: VTAM and Teradata Database Error Messages

==========

Article Created: 7 January 1993

TOPIC ----------

I am evaluating DAL 1.3.5 for VTAM using the Teradata database. While using the DAL tester on the Macintosh, I received the following error messages:

1) Using the COUNT function. COUNT (DISTINCT column-name) works properly but does not work for COUNT (column-name). I get the error "invalid operand of count function".

2) When creating WHERE clauses with a column of data type DATE. "date = xxx" works. "date BETWEEN" or "date IN" get the error message "invalid date/time literal".

3) "Some token expected" error message returned when there is an SQL statement with the HAVING clause.

Why am I getting these error messages?

DISCUSSION ----------

We have tested against the Teradata DBMS using both its interactive facility (bteq) and DAL. We found the following:

1) Although Teradata supports the COUNT (column name) function, DB2 does not. DAL was designed with DB2 and the 1986 ANSI Level-1 standard as its standard. Therefore DAL does not support all of the functions that individual DBMSs may support in their own query tools or programs.

   DAL attempts to verify that SQL commands are valid based on the above criteria BEFORE sending a query to the DBMS. (This is because DAL has to repackage queries to be DBMS-specific.)

In summary, DAL does not support the COUNT (column name) function because DB2 does not. DB2 supports the COUNT (DISTINCT column name) function and therefore so does DAL.

2) Different DBMSs have different "standard date formats". DAL has a "standard" format also. In order to do EQUAL, BETWEEN or IN queries using a date field, you (or an application) must first set the DAL standard date format ($datefmt) to match the DBMS' standard if they are different. The DAL standard date format is MM/DD/YYYY.

   The Teradata DBMS standard is not the same as DAL; the date format would be set by the following command to match Teradata's format:

```
set $datefmt = 'yymmdd';
```

   This will allow DAL to translate the dates properly, resulting in a valid return of data.

3) "Some token expected" is almost always a clue to a typographical error or SQL command error. Since DAL handles the HAVING clause for Teradata properly, we assume that you had a typo or incorrect statement.

   The following statement was processed properly by DAL to the Teradata in both release 1.3 and 1.3.5:

```
select cust_state, sum(receivable)
  from eng.customer
 group by cust_state
having cust_state > 'IL'
 order by cust_state;
```

DAL: Accessing AS/400 Databases

Revised: 1/21/93
Security: Everyone

DAL: Accessing AS/400 Databases

==========

Article Created: 6 January 1993

TOPIC ----------

I have a database file on my AS/400. What are the needed steps to make this file available to DAL?

DISCUSSION ----------

For databases created under SQL/400, you need only add the database name to the list of available databases in the SSID= portion of the Environment file (see page 13 of the DAL AS/400 Server Installation Guide). In addition, to assure that users can access the desired tables within the database, you need to set up a view which includes such access (see page 26 of the DAL AS/400 Server Installation Guide).

Basically these same steps are required if you wish to access other files on the AS/400. The install guide addresses the accessing of both Libraries and/or SQL Collections in its detailed installation instructions.

LaserWriter: Compatibility with Kanji Fonts

Revised: 1/15/93
Security: Everyone

LaserWriter: Compatibility with Kanji Fonts

==========

Article Created: 12 January 1993

TOPIC----------

I have the following questions about the LaserWriter IIf and IIg as well as the LaserWriter Pro 600 and LaserWriter Pro 630:

1) Since they are PostScript Level 2 printers, will they support composite fonts?

2) Can you use Kanji TrueType fonts or Kanji PostScript fonts with these printers?

DISCUSSION----------

1) Neither the LaserWriter IIf and IIg nor the LaserWriter Pro 600 and 630 support composite fonts at this time. None of these printers has a PostScript Level 2 driver and no one has yet created a hard drive with all of the KanjiTalk PostScript fonts.

2) TrueType KanjiTalk fonts can be printed to any Macintosh printer since the TrueType rasterizer can be resident on the Macintosh (in the case of a serial printer), in the printer's ROM (in the LaserWriter IIf, IIg, and LaserWriter Pro series), or in the printer's RAM (on other LaserWriter printers).

The LaserWriter IINTX-J. is the only LaserWriter that can print documents that use KanjiTalk PostScript fonts.

SNA•ps: AS/400 Serves As Gateway to Remote AS/400

Revised: 1/15/93
Security: Everyone

SNA•ps: AS/400 Serves As Gateway to Remote AS/400

==========

Article Created: 8 January 1993

TOPIC ----------

I have a SNA•ps gateway going to an AS/400 over Token Ring. The local AS/400 serves as a gateway to remote AS/400s that are on an SNA Token Ring network. I need to know how to get through the local AS/400 gateway to the remote AS/400s.

DISCUSSION ----------

The SNA•ps Config allows the entry of Network Qualifiers and Gateway Network Names. When an APPC controller is configured on the AS/400, there is a field for the Remote Control Point. Also, each AS/400 has a Local Network ID which is displayed by the "DSPNETA" OS/400 command.

When the SNA•ps connected to the local AS/400 and a client application uses Display Station Passthru calls to that machine, the SNA•ps Config for that Line/Partner/Local LU/Remote LU group is as follows:

Local Network ID of local machine goes in the Network Qualifier entry of the Partner.
&
Local Network ID of local machine goes in the Network Qualifier entry of the Local and Remote LU.
&
Remote Control Point from the AS/400 controller description of local machine goes in the Gateway Network Name of the Partner.

When you desire to connect to remote AS/400 on the Token Ring, then you have to configure another Line/Partner/Local LU/Remote LU group with the Local Network ID of the remote and use the entries in the remote AS/400 APPC Controller description. So the second Line/Partner pair is as follows:

Local Network ID of remote machine goes in the Network Qualifier entry of the Partner.
&
Local Network ID of remote machine goes in the Network Qualifier entry of the Local and Remote LU.
&
Remote Control Point from the AS/400 controller description of remote machine goes in the Gateway Network Name of the Partner.

And how does this work? The connection uses the APPN routing available with AS/400s on Token Ring. The Display Station Passthru call made to the second configured group will be routed first to the remote AS/400 and then the connection will be made.

System 7: Easy Access

==========

Article Created: 7 January 1993

TOPIC ----------

I'm getting a whistle noise along with a "U"-shaped icon (an arrow points downward in the center of this "U") that suddenly appears to the right of the applications menu.

DISCUSSION ----------

The action that causes this is pressing the Shift key five times. The icon and whistle sound are a feature of Easy Access. It's a control panel item that provides alternative ways to move the pointer and use the keyboard. You can find more information on its features and use in the Macintosh Reference Manual, pages 353-361.

AppleShare 2 and 3: Access Privileges for Apple II Network

==========

Article Created: 7 January 1993

TOPIC ----------

This article tells you how to set access privileges on an Apple II network under AppleShare 2 or 3 and System 7.

DISCUSSION ----------

Follow these steps:

1) Be sure to share the entire startup volume.
   Owner, Group, and Everyone can "See Files, See Folders." Change all enclosed folders unless you have an existing server. With an existing server, don't apply changes to enclosed folders you want Apple IIGS users denied access to some of the folders.

2) Give access to the folder named System, and all folders within it.
   Owner, Group, and Everyone can "See Files, See Folders." Change all enclosed folders.

3) If using Aristotle, follow these steps:

   a) For the Users Folder:
      Owner, Group, and Everyone can "See Files, See Folders."
      Owner and Group can "Make Changes."
      Group is Teacher.
      DON'T change all enclosed folders.

   b) For the Aristotle Folder:
      Owner, Group, and Everyone can "See Files, See Folders."
      Owner and Group can "Make Changes."
      Group is Teacher.
      Change all enclosed folders.

WorldScript: Difficulties of Multilingual Software Development

Revised: 1/11/93
Security: Everyone

WorldScript: Difficulties of Multilingual Software Development

==========

Article Created: 6 January 1993

TOPIC ----------

This article describes the obstacles presented to users and developers of multilingual software before the introduction of WorldScript.

DISCUSSION ----------

Inconveniences to Users

For users worldwide, the situation before WorldScript created several disadvantages:

- Delayed delivery of new technology
  For users, the reengineering of the base system software into different languages meant a delay in the delivery of local applications, local system software, and hardware.

- Inconvenient or inefficient text-input methods
  Asian customers also require an easy-to-use and customizable input method. This ease of use can be achieved via in-line input, which integrates text entry and display within a document, avoiding the constant appearance of the bottom line window to enter text.

  Because in-line input is more intuitive, many developers integrate it into their products by bundling the input method with their application. However, in the past, the only way to provide the necessary seamless integration between input method and application was to develop the two together. In addition to increasing costs, this process also meant that every application had to have its own input method. Users would have to learn one input method for working with a Japanese word processing program and another for working with a Japanese spreadsheet.

- Limited product selection
  The delays and the difficulty inherent in localizing products meant that many developers simply didn't bother to enter some markets, limiting the availability of a variety of software and hardware products.

Obtstacles for Developers

For developers, the burden of developing on reengineered software bases raised some roadblocks:

- Time-consuming localization
  Even after the localized system software versions were available, developers had to spend significant amounts of time modifying the code in their application software to support other languages. They also needed to understand the code changes that were made in order to support a particular language in the system software. So, they couldn't apply the development of localized applications for one language to another language. There were almost 30 different system software versions.

- Implementation of features in different languages
  Certain features are difficult to implement in other languages. As an example, fonts for the Japanese market can occupy more than 7MB, compared with the 40K to 60K required for a typical Roman font. In order to enter, display, and print such a font with comparable performance, special modifications must be made to the base system software. In the case of TrueType for Japan, these special modifications were well integrated, but they weren't part of the base system software.

- Complicated upgrades
  Each upgrade requires an entire new cycle of translation. System upgrades or product revisions require developers to revise their in-line input method as well as their application to support more than 30 languages.

International Software Efforts at Apple

Before WorldScript, Apple faced two major international software challenges:

- Time-consuming localization
  When Apple introduced a new operating system, localization teams had to translate and adapt that system into more than 30 languages. This meant not only translating the menu names and file names, but also changing the base system software to support right-to-left text or contextual forms. Most previous system software releases required different base system software to support each language. Translations for non-Roman languages could take more than a year.

- Difficulty expanding markets
  This delay in development meant a delay in releasing both software and hardware products, and made it difficult for Apple to expand into new markets.

The Solution: WorldScript

WorldScript greatly reduces this international burden, bringing benefits to users, developers and Apple alike. With WorldScript, the same system-level support already available for Roman languages such as English, French, German, and Spanish is provided for non-Roman languages such as Japanese, Chinese, Arabic, and Thai.

All of the language support needs, including contextual formatting, two-byte support, and multidirectional text capabilities, are provided via WorldScript in a single system software version. With WorldScript, Apple can release "world-ready" operating systems that support most of the world's languages.

WorldScript: Background on Different Language Structures

Revised: 1/11/93
Security: Everyone

WorldScript: Background on Different Language Structures

==========

Article Created: 4 January 1993

TOPIC ----------

Many languages have structures, writing directions, or alphabetical sorting orders that differ from those of English. Also, depending upon the geographic location, things such as the calendar, date and time display, and currency conventions can also vary widely. WorldScript deals with these different language and geographic software needs.

DISCUSSION ----------

From a software standpoint, languages around the world are divided into two categories: one-byte and two-byte languages.

One-byte Languages

One-byte languages are languages that require only one byte of memory to fully represent their character set. English and Spanish are examples of one-byte Roman languages, in which A to Z and 0 to 9 are the standard characters. Arabic and Hebrew are examples of one-byte non-Roman languages. (The term non-Roman refers to their different character set.)

The characteristic shared by one-byte languages is that their character sets contain fewer than 256 characters.

Two-byte Languages

Two-byte languages are languages that require two bytes of memory to fully represent their character set. The character sets of these non-Roman languages can consist of as many as 40,000 characters, which means that they require more memory to store.

Two-byte languages are also characterized by multiple character sets. Japanese, for example, has both Kana, a phonetic language of 300 characters,

and Kanji, an ideographic language with up to 40,000 characters. A phonetic language describes pronunciation. In an ideographic language, each character has a specific meaning -— for example, a single Chinese character represents the word sun.

Specialized Text Entry and Display (Input Methods)

The Asian two-byte languages present a text-entry challenge, because they contain far more symbols than can be easily typed directly from a keyboard. The solution is to use an input method to enter text into their documents.

The input technology enables users to type the word phonetically in Kana (a relatively limited character set) and then map that to the Kanji character that they ultimately want to enter. The input method typically provides a small window at the bottom of the screen that displays the typing. An analogy might be if you were to type English by entering the pronunciation marks used in dictionaries. After typing the phonetic description of the word, this technology would return the proper English word or a range of possible words.

Multidirectional Text

Roman languages are written left to right. However, some non-Roman languages, such as Arabic, run right to left, and Asian languages, such as Japanese, run top to bottom. Languages can also require multiple text directions, for example, Japanese is written from top to bottom and right to left.

Contextual Forms

In English, certain character combinations can form what are called ligatures, or physical joins between adjacent letters. For example, in some old English text you see "ae" shown as "æ." Similarly, in Arabic and Hebrew, the appearance of a character is determined by the adjacent characters. Thai is another language that requires this type of contextual formatting.

Language Attributes

Certain languages require different formats for attributes such as their date and time or currency symbols. These needs vary from something as simple as the changing of a 12-hour clock to a 24-hour clock for French, to something as complex as changing from a Gregorian calendar to a Lunar calendar for Arabic.

The International Software Problem

System software can easily support Roman languages such as English and French, but support for non-Roman languages such as Japanese and Chinese can often require the reengineering of the base system. Previous approaches to this problem have tended not to be very user friendly. For example, some systems force users to type in English because the software won't support their language. In other cases, the software is localized to the language, but certain features simply aren't implemented. In the case of the Macintosh before WorldScript, support for non-Roman languages such as Arabic and Japanese was added through a reengineering of the Roman base.

..TIL11252-WorldScript-Background_on_Different_Language_Structures.pdf

WorldScript is a set of integrated software technologies that removes many barriers from global software development, providing a simplified platform for developers to create applications in multiple languages.

System 7.1: Script and Language Availability

Revised: 1/11/93
Security: Everyone

System 7.1: Script and Language Availability

==========

Article Created: 5 January 1993

TOPIC ----------

This article tells you what languages are currently available with system software sold in various parts of the world.

DISCUSSION ----------

The System 7 MultiPack Upgrade Kit contains many European based, localized versions of System 7.1. These languages are: British, Czechoslovakian, Danish, Dutch, Finnish, French, French-Canadian, German, Italian, International (also known as Z version, which is basically U.S. English with support for other countries such as date and time), Norwegian, Portuguese, Spanish, Swedish, Swiss-French, Swiss-German, Turkish, U.S. Since these are all Roman scripts, they don't need WorldScript I or II, but they have all the resources including fonts to support those languages. The Roman-based languages don't have a WorldScript piece that you drop into your System Folder, and then have the ability to switch between two languages; rather, they are fully localized versions of the system.

The documentation on the CD states that the 800 number only supports English. As of today, no localized keyboards are available from Apple in the U.S. for other languages.

None of the WorldScript I (Hebrew, Thai, and so on) or WorldScript II languages (Japanese, Chinese, and so on) appear on the MultiPack CD. As such, there's no U.S. upgrade kit to provide the WorldScript I or II extension or any supporting resources for those languages that require them (for example, Arabic, Thai, Chinese, Japanese, Korean, and so on).

WorldScript II is sold in Japan and WorldScript I for Hebrew is also being sold. They are equivalent to the PUK in the U.S. There are no multiple CDs being sold in any Pacific countries for 7.1.

WorldScript: Not A Replacement For Unicode (2/95)

Revised: 2/15/95
Security: Everyone

WorldScript: Not A Replacement For Unicode (2/95)

==========

Article Created: 5 January 1993
Article Reviewed/Updated: 15 February 1995

TOPIC ----------

What is Unicode and is WorldScript a replacement for it?

DISCUSSION ----------

Unicode is an international industry standard used to encode written characters. It's a double byte universal character coding scheme that supports all modern day writing systems. It's been accepted as an ISO standard.

This standard makes it possible to encode all of the characters used for written languages throughout the world in one table. The current North American encoding scheme, ASCII, encodes only the Roman alphabet, which makes support for non-Roman languages difficult. These encoding schemes assume a graphics engine that can display the characters correctly (such as contextual forms or text direction).

WorldScript isn't a replacement for Unicode, but it's the next major step toward providing a multilanguage Macintosh computer. Apple was one of the founding contributors to the Unicode consortium and is an active participant.

Apple's System 7.5 and QuickDraw GX fully support Unicode, including large character set support, linguistic processing, and the Unicode bidirectional reordering algorithm.

WorldScript: What Is It & How Does It Work? (6/96)

Revised: 6/6/96
Security: Everyone

WorldScript: What Is It & How Does It Work? (6/96)

==========

Article Created: 5 January 1993
Article Reviewed/Updated: 6 June 1996

TOPIC ----------

WorldScript simplifies the way languages (or scripts) are supported in the system software. A script system determines the writing system's components:

- Character encoding
- Macintosh keyboard layout
- Fonts
- Input methods
- Sorting
- Date/time/number formats
- Script-specific access routines

For example, the script tells the system about such features as writing direction, accent placement, and special characters. This article describes WorldScript technology.

DISCUSSION ----------

Before WorldScript, all scripts were developed independently. This meant that each script installed its own modifications to the system. If more than one script system was installed, conflicting modifications often affected performance, RAM footprint, and stability.

With WorldScript, all script-specific behavior is defined by tables in system resources, and all processing is done by common routines in the WorldScript I and WorldScript II extensions. The WorldScript I extension provides the routines for one-byte languages, and the WorldScript II extension supports two-byte languages. The two extensions can coexist and provide functionality in the system at the same time. This means that the language support comes from a script bundle, which defines the language rules and behavior. WorldScript supports the language as it's defined in the rules from the script bundle.

WorldScript allows support for developing additional languages independently of system software releases. Today, Arabic, Hebrew, and Thai are examples of existing one-byte script bundles, and Japanese and Chinese are examples of existing two-byte bundles. And additional bundles can easily be developed. Developers don't have to write new code to support a new language -- only tables and language-specific resources. For example, to support another one-byte language, they develop a new language table (containing rules for date and time formats, writing direction, and so on) for the language's script bundle. This script bundle will then work transparently with the WorldScript engine to support that language.

To clarify, the WorldScript technology isn't a translation technology: It can't take input in one language and translate it into another language. What WorldScript provides is the ability to support written languages more easily in a single system software version.

WorldScript provides enhanced support for the interaction between applications and input methods. A common interaction for input methods and applications simplifies the support for in-line text entry. Bundling an input method with each product to provide in-line support is no longer necessary. Instead, users can buy their preferred input method, and it will work with any of their WorldScript-ready applications. Similarly, users have the ability to choose between multiple input methods installed in the same system.

WorldScript allows users to type and display text in almost any language, within the same document. Customers can purchase a language module or bundle of languages (for example, a Far East bundle) to use additional languages on their Macintosh.

Macintosh Easy Open Developer's Kit

Revised: 1/12/93
Security: Everyone

Macintosh Easy Open Developer's Kit

==========

Article Created: 12 January 1993

TOPIC ----------

Macintosh Easy Open simplifies opening files from other programs and platforms.

DISCUSSION ----------

The Macintosh Easy Open Developer's Kit is an extension to System 7 and a translation manager application programming interface (API). Developers can enhance their applications or translation systems to open and convert documents on Macintosh personal computers. They can open and convert documents even though the applications that created the files aren't available.

It's designed to simplify access to information from a variety of applications and across computing platforms. Once incorporated into third-party applications or file translation systems, Macintosh Easy Open provides options for accessing and manipulating documents quickly and easily. Applications require no modifications to take advantage of most Macintosh Easy Open features.

Macintosh Easy Open provides a number of ways to access Macintosh and non-Macintosh files. For example, when a user double-clicks on a document that normally couldn't be opened because the application that created it is unavailable, Macintosh Easy Open intercedes and searches for applications and file translation systems that are capable of opening the document, and lists them. Once you select an alternate application, Macintosh Easy Open transparently manages the conversion of the document using the application's internal translation capabilities or by using specialized translation software.

By incorporating a standard API, Macintosh Easy Open provides Apple

developers with translation-management services. These services can be integrated into their applications or translation systems to provide transparent data conversion whenever opening, copying, pasting, or publishing data from one format to another. While Macintosh Easy Open doesn't perform any data translation itself, it effectively manages access to third-party translation systems and applications, which perform the actual translation.

The Macintosh Easy Open extension also features added descriptive information about documents, including non-Macintosh files, and color icons in the Open and Save windows. This makes it easier to determine document types at the Finder level.

The Macintosh Easy Open Document Converter, which comes with Macintosh Easy Open, is a system utility that works with third-party translators to allow conversion of a document from one file format to another, without opening the document. With this feature, you can convert files easily and quickly by dragging file icons to the Document Converter icon.

Availability

The Macintosh Easy Open 1.0 Developer's Kit is available to developers from the Apple Programmers & Developers Association (APDA), Apple's mail-order service for developers.

Apple Internet Router: Description (5/94)

==========

Article Created: 12 January 1993
Article Reviewed/Updated: 3 May 1994

TOPIC

This article describes the Apple Internet Router.

DISCUSSION

With the Apple Internet Router, you can easily increase the size, enhance the performance, and improve the management of your organization's AppleTalk network.

The router offers you both local and wide area networking flexibility. You can connect your local workgroups over industry-standard network types, including LocalTalk, Ethernet, and Token Ring. And, as your network grows larger and more global, the Apple Internet Router lets you choose among several wide area options—you can link remote sites to your network through a dial-up connection over a standard modem, or you can add one of the Apple Internet Router Wide Area Extensions (available separately) to link your AppleTalk networks using X.25 or TCP/IP.

The Apple Internet Router features the AppleTalk Update-based Routing Protocol (AURP), a powerful wide area networking standard. AURP ensures that wide area links function efficiently, substantially reducing the traffic over wide area networks. With AURP, you can be certain that you're maximizing the use of your network resources.

Because the Apple Internet Router software runs on a broad range of Apple Macintosh computers and Workgroup Servers, you can tailor your router configurations to meet your cost/performance requirements. And, like other Macintosh computer–based software, the router is easy to use, configure, and support. Even a network novice can have the router up and running and can begin to make use of its powerful features within minutes. In addition, the router has built-in support for the Simple Network Management Protocol (SNMP), so it can be easily monitored by any SNMP-based management station.

Whether you have a small office and want to connect together a few workgroups or you're part of a multinational corporation with global internetworking needs, the Apple Internet Router provides the perfect network solution.

Apple Internet Router Features

Easy to Set Up and Use

- Offers Macintosh computer–based administration and configuration
- Operates in background, allowing other services to run concurrently

LAN and WAN Support

- Local workgroups can be connected with LocalTalk, Ethernet, or Token Ring
- Remote sites can be linked through dial-up modems, X.25, or TCP/IP

Protection from Unauthorized Access

- Administrator password option to lock out unauthorized access
- Dial-up authorization to authenticate remote sites

Network Efficiency

- Isolation of local traffic
- Update-based routing for efficient use of network resources
- Network-number clustering and remapping
- Built-in data compression for maximizing throughput

Robust Administration

- Reporting facilities to maintain network statistics
- Network management through industry-standard SNMP
- Ability to export data

Article Change History:
03 May 1994 - Updated to Internet Router 3.0.1.

Apple Internet Router: Specifications (5/94)

Revised: 5/3/94
Security: Everyone

Apple Internet Router: Specifications (5/94)

==========

Article Created: 12 January 1993
Article Reviewed/Updated: 3 May 1994

TOPIC ----------

This article provides the specifications and order information for the Apple Internet Router.

DISCUSSION ----------

Operating Requirements

Basic Connectivity Package
- System software version 7.0 or later
- A Macintosh computer with at least 4 megabytes of memory, a Power Macintosh computer or a Workgroup Server
- Basic Connectivity Package must be installed
- Ethernet or Token Ring connectivity
- Dial-up connections require V.32/9,600 bps or higher-speed modem
- Works on AppleTalk Phase 2 networks only
- Power Macintosh computers and PowerPCTM microprocessor-based Workgroup Servers require Network Software Installer (NSI) 1.4.3 or later

AppleTalk/X.25 Wide Area Extension
- Basic Connectivity Package must be installed
- Apple Serial NB Card(s)
- Available for 680x0-based Macintosh computers and Workgroup Servers only

AppleTalk/IP Wide Area Extension
- Basic Connectivity Package must be installed
- Ethernet or Token Ring connectivity

Setup and Configuration

The router provides the ease of use you've come to expect with any Macintosh computer–based application. You simply select the port you wish to configure and

depending on the connection, enter a network, host, or phone number for each network you want to interconnect. The rest is automatic, because the Apple Internet Router communicates dynamically with other routers to build a table of the entire internet. And, because the router runs in the background, you can maximize your investment by running other services such as AppleShare and SNA•ps concurrently.

Network Types

The Apple Internet Router can interconnect all types of AppleTalk networks, including:

- LocalTalk
- Ethernet
- Token Ring

This offers you great flexibility in choosing network media and topologies. You can use the router for such things as connecting LaserWriter printers on LocalTalk networks to Ethernet, connecting networks with dissimilar media, isolating network segments for security and performance, and extending the network beyond physical segment limitations. Multiple Token Ring cards with Power Macintosh computers and PowerPC microprocessor-based Workgroup Servers require NSI 1.4.5 or later.

Monitoring and Control

Through the Router Manager application, you can:

- Monitor network activity and network statistics
- View an active routing table of the entire internet
- Change the router setup information
- Print and export the contents of the setup and administrative displays

In addition, the Apple Internet Router supports the Simple Network Management Protocol (SNMP), enabling you to monitor the router from any SNMP-based management station. For Power Macintosh computers and PowerPC microprocessor-based Workgroup Servers, MacSNMP 1.1 is required.

Security

The Apple Internet Router offers sophisticated security options that protect the router and your sensitive network resources from unauthorized access, including:

- Router-administration password option
- Device hiding
- Network-number hiding
- Password and callback for dial-up connections

WAN Support

With the Apple Internet Router Wide Area Extension options you can connect geographically remote workgroups using wide area telecommunications links. The Apple Internet Router Wide Area Extension products include:

- DialUp Wide Area Extension (included with Basic Connectivity Package)

The DialUp Wide Area Extension:
- Connects two or more AppleTalk networks regardless of location using standard dial-up phone lines
- Works with any Hayes-compatible 9,600-bps or higher-speed modem with the appropriate script
- Includes modem scripts for many popular modems

• AppleTalk/X.25 Wide Area Extension (available separately)
The AppleTalk/X.25 Wide Area Extension:
- Enables two or more AppleTalk networks to communicate through an X.25 communications link, extending the wide area networking capabilities of the Apple Internet Router
- Offers a wide variety of X.25 parameter settings, enabling you to implement the most effective X.25 services
- Provides a set of standard profiles for the major public packet-switched networks worldwide
- Allows you to create your own customized profiles for any public or private data network
- Is available for 680x0-based Macintosh computers and Workgroup Servers

• AppleTalk/IP Wide Area Extension (available separately)
The AppleTalk/IP Wide Area Extension:
- Enables two or more AppleTalk networks to communicate through a TCP/IP network
- "Tunnels" AppleTalk packets over TCP/IP backbone networks
- Offers configuration by IP address, host name, or "guest"
- Supports Ethernet or Token Ring

Traffic Minimization

Several features of the Apple Internet Router ensure that only information that needs to travel across your communications link does so:
• AppleTalk Update-based Routing Protocol (AURP)
• Built-in data compression
• Network-number clustering

Support of Large Networks

The Apple Internet Router lets you build large internets that can connect across the street or around the world. An AppleTalk internet can support as many as 16 million devices (nodes) distributed over a virtually unlimited number of interconnected networks. And, because the Apple Internet Router provides for a nearly limitless number of networks and zones per internet, it can grow right along with your organization.

Extensibility

Because the Basic Connectivity Package was designed with extensibility in mind, you can choose from a wide variety of internetworking options. In addition to Apple's wide area extensions, third-party offerings let you expand in the areas of:
• Local area connectivity (such as FDDI)
• Wide area communications (such as SMDS, T1, SW 56/64)

• Network management
• Multiprotocol support (such as IPX, TCP/IP)

Specifications

Router table entries 5,400 maximum
Nodes per internet 16 million
Ports per router up to 32

Ordering Information

Apple Internet Router Basic Connectivity Package 3.0.1
Order no. M0502Z/B
• Apple Internet Router software and installer

DAL: Multiple Platforms, 2 Phase Commit, DRDA Compliance

Revised: 1/21/93
Security: Everyone

DAL: Multiple Platforms, 2 Phase Commit, DRDA Compliance

==========

Article Created: 12 January 1993

TOPIC ----------

Here are some questions regarding DAL and Multiple Platforms, 2 Phase Commit, and DRDA Compliance.

DISCUSSION ----------

Q. Can DAL update across multiple platforms at the same time?
A. DAL can have multiple sessions open, one client session for each server session. The application could update across these sessions but it would be the application controlling the updates, not DAL. The application would therefore have to be concerned with actual status in each environment and the application would have to do the rollbacks for every previously updated environment when one environment fails the update.

Q. Are there any multi-platform benchmarks available?
A. There are no results as of 1/12/93, but the benchmark study is in progress.

Q. Does DAL support a 2 phase commit? (With APPC connection?)
A. No, DAL does not support a two-phase commit in any environment. The application has to maintain all control that is not provided by the DBMS. Depending on the DBMS environment this can be more or less work for the application.

Q. Is DAL DRDA compliant?
A. No.

Networked PowerBook: Don't Use AutoRemounter 1.0 w/ AC Adapter

Revised: 5/16/94
Security: Everyone

Networked PowerBook: Don't Use AutoRemounter 1.0 w/ AC Adapter

==========

Article Created: 14 January 1993

TOPIC ----------

After adding PowerBooks to our network, we noticed a large increase in traffic. It seems that every few seconds an AEP "volley" is started from the PowerBooks, and the only way to disable the AEP packets is to remove the AutoRemounter control panel from the system folder and restart.

DISCUSSION ----------

If you have AutoRemounter 1.0 installed in the Control Panels folder on a PowerBook AND the PowerBook is plugged into an AC adapter, AutoRemounter will send 1-byte echo packets every 8 to 18 seconds to the broadcast address. This occurs whether you're successful or not in remounting a server volume. The problem occurs on both routed and non-routed networks.

Also a PowerBook Duo with AC adapter, or inserted into the Duo Dock networked with Token Ring, Ethernet, or LocalTalk with AutoRemounter 1.0 will send the same echo packets.

Workarounds:

- Use battery power on the networked PowerBook,
  or
- Remove AutoRemounter 1.0 from the System Folder,
  or
- Remove AutoRemounter 1.0 from your hard drive.

The amount of network traffic this problem generates depends on the number of Macintosh computers and the topology of the network. The biggest impact from traffic occurs in environments with large bridged networks and many Macintosh computers. The least impact is on LocalTalk networks or networks that are routed versus bridged.

Article Change History

02/02/93 - Revised to include PowerBook Duo and Duo Dock information.
03/18/93 - Revised to add paragraph about what kind of networks are most affected.

Video Displays: Aperture, Pitch, and Dot Pitch (2/93)

Revised: 2/16/93
Security: Everyone

Video Displays: Aperture, Pitch, and Dot Pitch (2/93)

==========

Article Created: 10 February 1993

TOPIC ----------

What do the terms aperture, pitch, and dot pitch mean?

DISCUSSION ----------

The cathode-ray tube (CRT) inside a monitor consists of an electron gun that shoots a beam of electrons through a perforated metal grill to a phosphor coating on the inside of the tube. When the beam strikes the phosphor, the coating emits light in the form of dots, or pixels.

The term "aperture" refers to the perforations or holes in the metal grill through which the electron beams travel before they strike the phosphor coating.

Pitch -- or dot pitch -- is the measurement of the distance between pixels on a monitor. If the pixels are closely spaced, the dot pitch is small; if the pixels are widely spaced, the dot pitch is large. Monitors with smaller dot pitches appear sharper, while monitors with larger dot pitches tend to appear less sharp and may have a "grainy" appearance.

The number of holes or apertures in one horizontal row of the metal grill determines the maximum horizontal resolution available for a particular CRT.

Note that the terms aperture, pitch, and dot pitch are used interchangeably and refer to the distance between pixels.

Novell Netware: Macintosh Printer Support

Revised: 1/20/93
Security: Everyone

Novell Netware: Macintosh Printer Support

==========

Article Created: 15 January 1993

TOPIC ----------

I am constructing an internal network for our sales office using Macintosh computers and Novell. We have a few DOS systems that will also be tied to the network.

For printing, Novell supports a protocol called NASI as an NLM for the DOS-based systems. Is there a Mac emulation for NASI? Is there another solution for a Novell/Ethernet environment?

DISCUSSION ----------

Novell doesn't provide a Mac NASI emulator, and Macintosh computers cannot use the PC-oriented (PSERVER) print queues. However, Novell provides the AppleTalk Print Services (ATPS) module with Netware for Macintosh, to which both Macintosh and DOS users can spool their print jobs. Macintosh users print to ATPS print queues by selecting the queue in the Chooser and then sending a print job, and because the printer is an NBP entity advertising on the AppleTalk network, Macintosh users can also print directly to the printer. DOS users print to AppleTalk printers via the ATPS queues by using the CAPTURE or NPRINT command.

ATPS is the recommended Netware printing strategy for the Macintosh.

System 7: Rescued Items Folder Appears in the Trash 1/93

==========

Article Created: 18 January 1993

TOPIC ----------

What is the Rescued Items Folder that appears in the Trash Can?

DISCUSSION ----------

The Rescued Items Folder is created any time a System 7 Macintosh starts up with items in the Temporary Folder. These items are then moved from the Temporary Folder to the Rescued Items Folder in the Trash so the user can inspect them.

The Temporary Folder is a folder that sits at the root level of a drive and is invisible to the user. Applications can use it for any purpose. Typically, this includes scratch files or temporary data files.

Ofoto: Color OneScanner File Size 1/93

Revised: 1/25/93
Security: Everyone

Ofoto: Color OneScanner File Size 1/93

==========

Article Created: 20 January 1993

TOPIC ----------

How large is a 1200dpi, 24-bit, 5x7 image created using the Apple Color OneScanner, using the Ofoto software? Also, how much RAM is necessary to process it using the Ofoto software?

DISCUSSION ----------

The quick answer is VERY large. There's no way to tell exactly what the size would be; however, we can estimate approximately 200 to 400 Megabytes. Also, since Ofoto uses temporary files on disk, at least that much additional disk space needs to be free. To be safe, there should be at least 1 gigabyte of free disk space (prior to the scan) at Ofoto's disposal to scan an image at this size and resolution. Once this is scanned and taken to an application like PhotoShop, there should be approximately .5 gigabyte of disk space available for PhotoShop temporary files. Based on a no-compression scan, this is comparable to file sizes on any computer system doing the same job.

Ofoto could do this scan in its default RAM partition; however, the speed would be unacceptably slow. We recommend 8MB installed, at the very minimum, giving Ofoto as much as possible. Even with this much RAM, a scan of this nature will take a fair amount of time. For more acceptable scanning speeds, increase the amount of RAM available to Ofoto to the greatest possible.

Using QuickTime's JPEG (or other type) compression will reduce the final file size according to the amount of compression applied. However, during the scanning process, use the above numbers as a rough guideline.

Macintosh: Using Monitors Control Panel To Add/Change Display

==========

Article Created: 20 January 1993

TOPIC ----------

When I added a Macintosh Portrait Display to my PowerBook, I couldn't move the mouse pointer to the new display.

DISCUSSION ----------

Open the Monitors control panel, click on the picture of the Portrait Display you see there, then close the control panel. This updates the 'scrn' resource in the System file, so when the PowerBook is starting up, it is aware of the external monitor and adds it to its "display space."

This is not specific to the Portrait Display: if you set up a PowerBook to work with a Portrait Display, then connect the PowerBook to a different display, you'll have to go through the same process again.

You can also see this on other Macintosh models if you switch between displays on a single video card installed in a Macintosh.

AppleTalk Internet Router and Text Color Change

Revised: 1/26/93
Security: Everyone

AppleTalk Internet Router and Text Color Change

==========

Article Created: 20 January 1993

TOPIC --

Why does the text color change in the network information window in AppleTalk Internet Router 2.0? I am referring to the text in the window, not just the column title text. The column titles are blue but the text in the window turns red for a few seconds and than back to black. What causes the change to happen?

DISCUSSION --

From pages 82 and 83 of the AppleTalk Internet Router Administrator's Guide:

> The routing table is a dynamic display that reflects continuous changes in routing information on the internet.
>
> The larger the internet, the more likely it is to be undergoing change, as routers update one another about alternate routes, distances, and changes in network connections.
>
> ...
>
> Note: Whenever a change is made to an entry in the routing table, that item is boldfaced for a few seconds to call your attention to the change.

The last paragraph answers the question. On a color screen, the item that is updated is boldfaced and change to red for a few seconds. When this occurs, it does not mean that something is wrong, it just means that something has been updated.

DAL: Specify a Procedure Parameter For the Order By Command

Revised: 1/26/93

DAL: Specify a Procedure Parameter For the Order By Command

==========

Article Created: 20 January 1993

TOPIC ----------

I have a DAL question about how to specify a procedure parameter to do a sort using the "order by" SQL command.

Here is an example. Sorting in the following procedure should be possible on:

- Item fromdepot, which works
- Item 3 the calculated value, which does not working.

The procedure and some examples of the execution is shown below:

```
  procedure GetTotalList( xFromdate, xSortitem)
  argument Date       xFromdate ;
  argument Objname    xSortitem ;
  {
    SELECT
         A.FromDepot ,
         A.ToDepot   ,
         Sum(a.volume*a.intransitqty/a.volumeqty)
    FROM
         MLYXX.TB23Transit A
    WHERE
         A.Tickoffdate > xFromdate AND
         A.volumeqty   > 0
    GROUP BY
         A.Fromdepot ,
         A.Todepot
    ORDER BY
         :xSortitem  ;
    FOR EACH ä printf("%6sÉt%6sÉt%6.1fÉt",
                    ->FromDepot        ,
```

```
                    ->ToDepot          ,
                    ->Expr3           );
            }
    COMMIT;
  } end procedure GetTotalList;
```

The execution example below shows the procedure with error message:

```
  begin> gettotallist('1992-12-25', 3);
  more> go
  Execution begins...
  Error -206 (0)  column not found  (3)
  Message is "network", line 1 : unknown column name for any table
```

The execution example below shows the procedure when it works OK:

```
  more> gettotallist('1992-12-25', "Fromdepot");
  more> go
  Execution begins...
  BE1101  DE1101   645.2  BE1101  DE1401   460.7
```

What is wrong?

DISCUSSION ----------

To do a sort, two things are required:

- The DBMS must support the ORDER BY clause. Not all DBMS brands support this SQL feature. This clause is what actually does the sort, not DAL.

- The field to be sorted on MUST be a result column in the cursor (results table) created by the select command. In other words, it has to be a column name or a column number from the results table.

The following example has been tested with DB2 and DAL (as a procedure) and uses the demo data that is installed with DAL for consistency:

```
  procedure sorttest ()
  {
     select cust_state, sum((receivable / credit_line) * 100)
       from cl1.customer
      group by cust_state
      order by 2 ;
        for each {
                  print cust_state, ->2 ;
                }
  }
  end procedure sorttest;
```

In your procedure, you were trying to do the ORDER BY clause with some other field than what is available to the DBMS in the results table. Your only valid choices for a field to specify in the ORDER BY clause are:

- FromDepot
- ToDepot
- 3 (the column number of the SUM expression)

If you want to give the sort field as an argument that could change with each execution of the procedure, the sortkey MUST be an integer, which will translate to the column number. A DAL procedure does not allow column name to be used in a parameter of a procedure.

As long as the procedure specifies that the sort field argument is an integer, and you select a valid column number (in the results table) it works just fine. Here is an example:

```
  procedure sorttest (sortkey)
  argument integer sortkey ;
  {
     select cust_state, sum((receivable / credit_line) * 100)
       from cl1.customer
      group by cust_state
      order by :sortkey ;
        for each {
                   print cust_state, ->2 ;
                 }
  }
  end procedure sorttest;
```

System 7: Error When Copying Disk Image to RAM Disk (7/96)

==========

Article Created: 21 January 1993
Article Reviewed/Updated: 22 July 1996

TOPIC ----------

I am experiencing some difficulty copying a floppy disk image to a RAM disk. If the RAM disk size is 1 MB to 2 MB, the computer attempts to erase the contents of the RAM disk volume, and then reports an error -35.

DISCUSSION ----------

This error occurs because the Finder was written under the assumption that any volume with fewer than 2 MB must be a floppy disk. However, this issue has been resolved in System 7.5.2 and later.

DAL and SQL*Net Compared

Revised: 1/21/93
Security: Everyone

DAL and SQL*Net Compared

==========

Article Created: 12 January 1993

TOPIC ----------

I need a comparison of DAL to SQL*Net from Oracle.

DISCUSSION ----------

Beyond what's in the trade press, we can't offer much information on this comparison.

Remember that SQL*Net will only access Oracle's DBMS. DAL's advantage is the presentation of a single API, which allows access to approximately thirteen DBMS/Operating System environments.

Any product that is written for a single environment will be able to make use of features, or knowledge, that is particular to that environment. A product that tries to provide homogeneous access to many environments will not be able to make use of such features. It all depends on what you want/need and how sure you are that you've fully defined your needs, now and for the future.

System 7.x: Limit on Number of File Names in Open Dialog (3/95)

Revised: 3/16/95
Security: Everyone

System 7.x: Limit on Number of File Names in Open Dialog (3/95)

==========

Article Created: 22 January 1993
Article Reviewed/Updated: 16 March 1995

TOPIC ----------

Under System 7.x, why does the Open dialog box in an application not display all of the files in a folder?

DISCUSSION ----------

This is a real world limitation imposed by the use of List Manager in the SFGetFile dialog box used for opening files. There's nothing wrong with the directory structure, nor is there anything wrong with the application. Here's a description of what's going on:

This limitation isn't specific to System 7.0. The same limitation (with a slightly different variation) existed under System 6. The issue is that the SFGetFile call, which generates the Open dialog box in almost every application, uses the List Manager to display the files in the file list of the dialog box. The List Manager has a specific limit on the amount of data stored in a list. This limit is 32K. However, SFGetFile uses a portion of that 32K for data other than the file names. So you end up with 64 bytes per file if you have the maximum file name size of 31 characters (plus 1 byte for the length byte). We arrived at this number empirically by writing a program that created files with the names: "000abcdefghijklmnopqrstuvwxyzab" through "999abcdefghijklmnopqrstuvwxyzab".

A good approximation of how many files will display is 32767 / (file name size + 32). This results in 682 for 16 character names and 819 for 8 character names.

The bottom line beyond all of these calculations is that this is a hard limit. There's no workaround to display more data from a single folder within this dialog box. The list displays alphabetically, and the bottom of the list isn't displayed.

Also, as you increase the number of files in a folder, the performance at the

Finder level decreases pretty dramatically. Although the Finder can handle these numbers of files, you'll see slowdowns in opening and closing windows. Another concern is the total number of files you're planning to have on a volume. There are very real limits on this as well, described in other articles posted in the Tech Info Library.

While the problem remains in System 7.5, you will now be notified that there are more files in the directory than can be displayed.

Article Change History:
16 Mar 1995 - Clarified the last sentence to specify System 7.5.
15 Feb 1995 - Reviewed for technical accuracy.

DAL for AS/400: Server Installation Clarifications

Revised: 1/25/93
Security: Everyone

DAL for AS/400: Server Installation Clarifications

==========

Article Created: 22 January 1993

TOPIC ----------

This article contains additional information about the Data Access Language for AS/400 Server installation. These items should be noted as changes, additions, or clarifications to the "Data Access Language Server for AS/400 Installation Guide, Version 1.3.7".

DISCUSSION ----------

Informational

The following informational items are true of the server at release 1.3.7, as loaded from the distribution tape/cartridge with a volume serial number of "DAL137".

- On page 9, the restore of the distribution library (Step 3 of "Installing the server") will result in 57 Objects being restored and 114 Security or data format changes occurring.

- On page 10, the restore of the DALDEMO library (Step 5 of "Installing the server") will result in 11 Objects being restored and 22 Security or data format changes occurring.

These counts may change with future releases of the server. For that reason this information is not included in the published documentation.

Change Required

- On page 12, Step 7 of "Installing the server", the display system values command is not accurate. It should be:

    DSPSYSVAL SYSVAL(QSYSLIBL) <enter>

Instead of:
DSPSYSVAL SYSVAL(QSYSLIB) <enter>

- On page 27, the "note" has a typographical error at the end of the first sentence. It should be:

  library/DALDBV01

  Instead of:
  library/DALDBV0L

Clarification

Appendix B, "Displaying Table Lists", describes the two methods that can be used to create the list of tables that an individual user, or the entire site, will see when the DAL command "Describe Tables" is issued. This is the list of available tables that the user will see when using an application that supports the Data Access Language client.

Please note that DAL uses the SQL standard format of "Creator.Tablename" instead of the AS/400 standard of "Library/File" when displaying this table list.

In the AS/400 environment, the table list can actually be a list of:

- Libraries and Files - displayed in the Creator.Tablename format as LibraryName.FileName

- SQL Collections and Tables - displayed in the Creator.Tablename format as Collection.Tablename

- A combination of both libraries and SQL collections

It is important to note that, in the AS/400 environment, the entire environment is available for display in the table list if no "view" has been created, or if it has been created improperly. This is because DAL is reading a system-wide directory in the AS/400 environment, not just a DBMS system catalog. This search can take a long time and can cause confusion as it will probably not properly reflect what the user should actually be able to see and access.

It is also important to note that the AS/400's object authorization is the final arbitrator of what someone can access. Users may be able to see a file and/or library name in the table list, but if they don't have object authority, they will not be able to see column/field names, nor the actual data.

As installed, there is a site-level view created (specified in the environment file, see page 14) which will display only the demonstration tables shipped with the DAL for AS/400 Server. A new site-level view, or set of user-specific views, must be created to display a table list which is pertinent to the desired information for the site or user(s).

Creating an SQL View

Step 3 of Appendix B, "Create an SQL view with a statement similar to" (page 27), tells you how to create an SQL view that will result in the desired list of libraries and file names. To create this view, you need the SQL/400 licensed product, not just the SQL/400 runtime libraries.

The SQL create view statement documented in the install guide, on page 27, is incorrect.

If you are creating a view for a specific user, you must first create a library with the userID as the library name and then create the view, substituting the library name (which is the same as the userID) in place of "library" in the create view statement.

Use the STRSQL (Start SQL) function of the AS/400 while you are signed on as QSECOFR to create this view.

1) If you wish to define a view with the exclusions stated in the install guide on page 27, which are:

   - entries with null file or library names
   - source files (DBXTYP would be an 'S')
   - all libraries or collections starting with 'Q'
   - all files starting with 'QDICT'

   The following is the correct SQL/400 create view statement:

```
CREATE VIEW library/DALDBV01
AS SELECT DBXFIL, DBXLIB, DBXOWN, DBXATR, DBXNFL, DBXTYP
FROM QADBXREF
WHERE NOT DBXLIB = ''      << there is no space between the quotes! >>
  AND NOT DBXFIL = ''      << there is no space between the quotes! >>
  AND NOT DBXTYP = 'S'
  AND NOT SUBSTR(DBXLIB,1,1) = 'Q'
  AND NOT SUBSTR(DBXFIL,1,5) = 'QDICT'
```

2) If you wish to allow the user to see a list of ALL the libraries (limited as specified above) EXCEPT for a specific one, change the command to:

```
CREATE VIEW library/DALDBV01
AS SELECT DBXFIL, DBXLIB, DBXOWN, DBXATR, DBXNFL, DBXTYP
FROM QADBXREF
WHERE NOT DBXLIB = 'LibraryName'
  AND NOT DBXLIB = ''
  AND NOT DBXFIL = ''
  AND NOT DBXTYP = 'S'
  AND NOT SUBSTR(DBXLIB,1,1) = 'Q'
  AND NOT SUBSTR(DBXFIL,1,5) = 'QDICT'
```

3) To limit the user to see ONLY a specific library, change the command to:

```
CREATE VIEW library/DALDBV01
AS SELECT DBXFIL, DBXLIB, DBXOWN, DBXATR, DBXNFL, DBXTYP
FROM QADBXREF
WHERE DBXLIB = 'LibraryName'
  AND NOT DBXFIL = ''
  AND NOT DBXTYP = 'S'
  AND NOT SUBSTR(DBXFIL,1,5) = 'QDICT'
```

Multiple libraries can be chosen with the addition of:

```
  OR DBXLIB = 'LibraryName'
```

to this statement (option #3).

Similar syntax can be used to limit the display of files within a library. Refer to the AS/400 Structured Query Language/400 Reference and Programmer's Guide manuals for additional information on creating a valid SELECT statement for the CREATE VIEW statement.

Creating a View from a Logical File

If you do not have the SQL/400 licensed product, you must create a logical file rather than creating the SQL view as documented above. In Appendix B, the section "Creating a logical file" (page 27) tells you how to create a logical file that will result in the desired table list. Page 28 shows the source that must be changed, and then used as the basis for creating the individual logical file for each user.

The following choices explain the results that will be displayed by the logical file created as a result of using the source file given as an example in the appendix (#1), or the changes you can make if you wish to restrict the libraries/SQL collections that will be displayed (#2 and #3).

Please note that this source code is sensitive, by column number, to where fields are entered on the line. Please refer to the AS/400 "Data Description Specifications Reference" manual for complete instructions on modifying these source control statements.

1) To present the user with a list of ALL the libraries and files in the AS/400, you need only create the logical file without changing the source file as loaded from the tape and documented on page 28. The source file is QDDSSRC in the DALLIB library and the create logical file command is documented on page 28 in the last paragraph.

2) If you wish to allow the user to see a list of ALL the libraries EXCEPT for a specific one:

change the source to have the DBXLIB statement as:

```
     O DBXLIB             COMP (EQ 'LibraryName')
```

instead of:

```
        O DBXLIB              COMP (EQ '           ')
```

3) To limit the user to see ONLY a specific library:

change the source to have the DBXLIB statement as:

```
        O DBXLIB              COMP (NE 'LibraryName')
```

instead of:

```
        O DBXLIB              COMP (EQ '           ')
```

Both options 2 and 3 use 'negative' compare logic because the "O" preceding DBXLIB in the statement means "Omit all that pass the following COMPare". Attempts to change this logic to a positive COMPare with the use of Select instead of Omit were not successful (in our testing). So the statements documented here are the recommended logic, which has been tested. Just be careful in the compare logic!

Apple Color Printer: Recommended Paper, Transparency Film (2/93)

Revised: 2/23/93
Security: Everyone

Apple Color Printer: Recommended Paper, Transparency Film (2/93)

==========

Article Created: 15 February 1993

TOPIC ----------

What paper and transparency film for overheads are recommended for use with the Apple Color Printer?

DISCUSSION ----------

Paper

Apple recommends using coated paper with the Apple Color Printer for optimum printing quality, though the printer will accept plain copier paper. Plain paper is satisfactory for printing text, but the ink tends to bleed noticeably when printing graphics.

Apple does market coated paper for the Apple Color Printer, although you can use any coated paper which is labeled "for use with plain paper ink-jet printers."

Transparency Film

Use only transparency film that is recommended "for plain paper ink-jet printers." If normal transparency film is used, the ink will not dry on the plastic.

DAL Server for AS/400: Features

Revised: 1/25/93
Security: Everyone

DAL Server for AS/400: Features

==========

Article Created: 25 January 1993

TOPIC ----------

This article describes the features of DAL server for AS/400.

DISCUSSION ----------

The Data Access Language Server for the AS/400 is a networking software product that provides access, from an Apple Macintosh personal computer, to data on IBM AS/400 host system. The DAL server allows personal computer applications that support Data Access Language -- such as spreadsheets, query tools, and custom-developed applications -- to access AS/400 data. The AS/400 operating system, OS/400, has built-in database structures that respond to SQL query access. The most often used IBM-supplied DBMS for the AS/400 is SQL/400, which is a IBM-licensed product.

The DAL server receives requests from the personal computer application, carries them out on the AS/400 through the SQL/400 runtime facility, and sends the desired data back to the application for desktop processing. The DAL server for AS/400 works with existing SQL/400 databases and AS/400 libraries and files. It is not necessary for the AS/400 to be running SQL/400, because the runtime facilities in OS/400 support DAL access to databases.

The DAL server for AS/400 brings the powerful DAL dialect of SQL to the desktops of AS/400 users. The DAL user can access information about the databases (collection or library) belonging to the user, tables (files) belonging to the database (column) information pertaining to that table. Another important SQL extension DAL brings to the user is the ability to group DAL language statements, name them, and store them on the AS/400 host. These stored procedures can be repeatedly invoked on the AS/400 from the desktop application, reducing network traffic.

The connection path between DAL client Macintosh computers and the AS/400 uses APPC (LU6.2) communication protocols. The LU6.2 sessions are provided to the client machines via Apple's SNA•ps gateways. The physical link can be either Token Ring or SDLC using RS-232 or V.35.

The DAL AS/400 server can be purchased from Apple Computer in either 1/2 inch 1600 bpi, or 1/4 inch cartridge tape. Pricing is based on a range of connected users, with several license size offerings from 1-5 users to 150 users. The DAL AS/400 product requires the DAL client software, version 1.3.7, be purchased separately for each Macintosh. This can be done with single licenses, 10 packs, or a bulk license for 150 users.

An important part of DAL solution is making use of the diverse number of commercially available query tools and spreadsheets that support DAL clients. As of January 27, 1993, the query tools include Clear Access, Data Prism, and GQL; and the spreadsheets include EXCEL, Wingz, and Claris Resolve.

DAL Server for AS/400: Basic Features and Benefits

Revised: 1/25/93
Security: Everyone

DAL Server for AS/400: Basic Features and Benefits

==========

Article Created: 25 January 1993

TOPIC ----------

This article describes the basic features and benefits of the DAL server for the AS/400.

DISCUSSION ----------

There are several DAL servers that run on IBM mainframe systems and access under TSO or VTAM the DB2 DBMS. There is also a DAL server to accessing SQL/DS under VM/CMS. The DAL server for the AS/400 uses a C-Language based server patterned after the DAL UNIX server. The DAL 400 server accesses relational and flat database files that are running in the IBM-supplied SQL DBMS, referred to as SQL/400. The AS/400 operating system (OS/400) has SQL/400 executables built-in, to allow access to SQL/400 databases. DAL does not require the customer install the separate IBM-supplied SQL/400 licensed program, because it can use the OS/400 supplied executables. If a customer wishes to exercise better maintenance control over database files (update), then it is recommended the customer purchase the IBM-supplied SQL/400 licensed program.

The DAL 400 server can only access the AS/400 using SNA APPC gateways. These gateways are Apple SNA•ps gateways, which support APPC communication over SDLC or Token Ring physical links.

When the DAL server is installed on the AS/400 and the APPC SNA•ps gateway is operational, a Macintosh DAL client application will be presented with the same interface as all other DAL server connections. A desktop query of an SQL/400 database will have the same "look and feel" as accessing Rdb on a DEC VAX machine.

The benefit to AS/400 users will be especially significant if they also must access database information on other host platforms. The same client

application and DAL client software can easily access data, the same way, on different host machines, regardless of host DBMS.

The potential marketplace for the DAL AS/400 product is quite large: the installed base of AS/400s is over 150,000 at the end of 1992 -- and growing steadily. AS/400 machines are commonly found in K-12 education accounts, medium to large business, and higher education campuses.

DAL for AS/400: Sources of Additional Information

Revised: 1/25/93
Security: Everyone

DAL for AS/400: Sources of Additional Information

==========

Article Created: 25 January 1993

TOPIC ----------

This article describes some sources of information, from Apple, on DAL for the AS/400.

DISCUSSION ----------

The Data Sheet (p/n L0353LL/A) gives a detailed overview of the product, how to order it, and tells what support groups can assist with installation.

The Data Access Language Server of AS/400 Installation Guide, version 1.3.7 (p/n R0445LL/A) covers in detail installation of the Server application on the AS/400, setting up access to SQL/400 databases, and how to configure both the AS/400 and the SNA•ps APPC gateway.

Apple has a Network Information Line for DAL, 408-862-3385, which CUSTOMERS can call to get more information about DAL and SNA•ps gateways. If a customer wishes a 90-day evaluation of the DAL product, use the Information Line to arrange this free service.

The DAL AS/400 Server product is also backed by an initial 90-day free software support 800 number. This support service applies to the 90-day evaluation process or the initial 90 days of a purchased server. After the initial period, support contracts are available for a fee.

The Apple Serial NB Card, Apple Token Ring 4/16 NB Card, DAL servers, DAL Client for Macintosh, and SNA•ps Gateway can be ordered from any Apple sales office or network products certified dealer. For information about location of resellers, contact Apple toll-free in the United States, 1-800-538-9696. Apple NuBus cards and SNA•ps Gateway can also be ordered from the Apple Catalog in the U.S. using 1-800-795-1000.

DAL for AS/400: Connection Script

Revised: 1/25/93
Security: Everyone

DAL for AS/400: Connection Script

==========

Article Created: 25 January 1993

TOPIC ----------

This article describes the DAL for AS/400 connection script.

DISCUSSION ----------

The DAL connection script for the AS/400 Server must be included in the DAL Preferences file in the Macintosh System folder. The layout of this connection script is similar to the APPC IBM VTAM server script except for the addition of the name of the remote transaction program. This program name is named with the AS/400 Library followed by the program name. The syntax for this entry is DALLIB/DALSERVER if the default names at installation are used. Refer to Appendix C in the DAL Server for AS/400 Installation Guide for more details.

Important: Use Capital Letters

All AS/400 named entities in DAL connection scripts, such as, local LU name, remote LU name, mode, program name, User ID, and password must be entered in CAPITAL LETTERS only. This is required since the AS/400 only understands uppercase letters. All terminal emulators change any entered lowercase to uppercase before transmission to the AS/400. The DAL connection script data transfer is not sent via a terminal emulator but in SNA Bind and Program start commands. Any AppleTalk named entities, such as zone and gateway name, must match exactly because these names are case-sensitive.

DAL for AS/400: Installation Process

Revised: 1/25/93
Security: Everyone

DAL for AS/400: Installation Process

==========

Article Created: 25 January 1993

TOPIC ----------

This article describes the DAL for AS/400 server and SNA•ps Gateway installation process. It also provides references to the installation guide.

DISCUSSION ----------

The DAL Server installation procedure is described in detail in the Data Access Language Server for AS/400 Installation Guide. The highlights of the process include:

1) Log on as the QSECOFR or a user profile with *SECADM and *ALLOBJ authority.

2) Restore the DAL distribution library from the 1/2-inch 9-track tape or the 1/4-inch cartridge tape. The default library on the AS/400 is DALLIB. Optionally, restore the DAL demonstration database.

3) Review the README files in the DALLIB for any installation updates.

4) Prepare to run the DALINST command by verifying that the IBM-supplied library, QSYS2, is in the system part of the library list. Library QSYS2 is necessary for the proper execution of the DALINST command.

5) Run the DALINST command. A large variety of tasks are performed, which are essential to the successful operation of the DAL Server.

6) Review and modify the DAL environment file, DALENV, which is in the DALLIB. This file specifies and limits the output of the DAL SQL extension commands DESCRIBE DATABASES and DESCRIBE TABLES.

7) Review, and modify if needed, the DAL procedures file.

8) Refer to chapter 3 in the Installation Guide for the procedures to verify the installation of the DAL Server. Log on with any User ID and run Interactive DAL (IDAL400). IDAL400 is a diagnostic utility that allows for testing interactively, on a midrange terminal, the operation of the DAL Server. The testing is done by verifying access to databases, the demonstration database supplied on the DAL installation tape.

SNA•ps Gateway Configuration

DAL Server for the AS/400 uses APPC communications connections between the AS/400 and the Macintosh computers. The Macintosh connection is done through a SNA•ps APPC gateway running on a Macintosh II or Quadra class system equipped with an Apple Token Ring 4/16 NB Card or an Apple Serial NB Card supporting SDLC protocols. The details on how to configure the AS/400 and the SNA•ps gateway are explained in detail in Appendix E of the DAL Server for AS/400 Installation Guide.

Appendix E carefully leads the person performing this part of the installation through the details of the AS/400 configuration for the Line, Controller, Device, and Mode. Both Token Ring and SDLC configurations are shown. As the AS/400 configuration is progressing, the key entries made on the AS/400 screens can be entered on worksheets included in the DAL Installation Guide. The worksheets can then be used as a reference for the information required in the SNA•ps APPC gateway configuration process.

Further details on how to configure and control SNA•ps gateways is included in the SNA•ps Administrator's Guide.

DAL for AS/400: Pre-Installation Checklist

Revised: 1/25/93
Security: Everyone

DAL for AS/400: Pre-Installation Checklist

==========

Article Created: 25 January 1993

TOPIC ----------

This article provides a pre-installation checklist for the AS/400, Macintosh, and Network connection.

DISCUSSION ----------

For the DAL AS/400 Server to operate properly, the proper environment must exist on the AS/400, the Macintosh, and the network connection.

The AS/400

The AS/400 must be running OS/400 version 2, release 1, Modification 1 or later. SQL/400 is not required because the run-time SQL/400 libraries that are part of OS/400 are sufficient for the operation of the DAL Server.

The DAL Server takes approximately 3MB of AS/400 DASD storage.

The AS/400 must have at least one Token Ring or serial communication adapter.

For software installation only, the user must have access to the QSECOFR User ID or similarly privileged account.

Data access is limited to those functions allowed by SQL/400. To assist in problem resolution, the licensed program, SQL/400, could be installed by the customer. The customer could then test a given set of SQL statements to determine if SQL/400 will support the request.

The DAL Server provides access to SQL/400 collections and tables, and native AS/400 data structures, such as libraries and files.

If you are going to Insert, Update, or Delete you must have:
• SQL400 installed on your AS/400
• Journaling turned on for Databases and/or files.

The Macintosh

The Macintosh computer will have to be equipped with the DAL client version 1.3.7. This client can be purchased from Apple Computer. In addition, the client machine may also need one of the database access applications, such as Clear Access, Data Prism, or GQL -- or a spreadsheet product like Excel, Wingz, or Resolve.

The Network Connection

Network access from the Macintosh to the AS/400 is supported using APPC (LU6.2) communications over SDLC or Token Ring physical attachments. This requires either an Apple Token Ring 4/16 NB Card or an Apple Serial NB Card. The APPC attachment makes use of the Apple SNA•ps Gateway product, which runs on the Apple Token Ring or Serial card. The SNA•ps Gateway can distribute APPC sessions using AppleTalk protocols over LocalTalk, Ethernet, or Token Ring network cabling.

DAL for AS/400: Technical Support Issues

Revised: 1/25/93
Security: Everyone

DAL for AS/400: Technical Support Issues

==========

Article Created: 25 January 1993

TOPIC ----------

This article describes some technical support issues in connection with DAL for AS/400.

DISCUSSION ----------

DAL client software is not included as part of the Apple system software effective with System 7.1. The DAL client code, version 1.3.7, is required to access the DAL Server for the AS/400, and must be purchased separately from Apple Computer. This version of DAL client code is NOT available with any version of system software.

The DAL client is installed in the Macintosh using the standard Networking & Communication Products Installer. The installation process for System 7.X writes the DAL client and any DAL Network Adapters into the Extensions folder. The DAL Preferences file is stored in the Preferences folder within the System folder. There are no changes to the actual System file.

Additionally, you may wish to drag some of the installation verification tools to the hard disk of the client Macintosh. The DAL Installation Checker shows which versions of DAL client and DAL Network adapters are available. Be sure that DAL client 1.3.7 and DALnet adapter named SNApsAPPC are both available and version 1.3.7.

The DAL Tester can be used to verify the installation of DAL and interactively execute DAL commands. You can enter DAL data manipulation, program control and output statements to the Tester application and view results of these statements. The DAL Tester can be used for all DAL connections and uses the DAL client and DALnet drivers installed in the Tester Macintosh. If the DAL Tester works with the DAL Preferences and the DAL server installed on the Host system, the overall installation can

be assumed to be sound.

The DAL debuggers resemble and operate like the DAL Tester, because they run practically the same interactive application. The major difference is that the debuggers do not use the DAL driver installed on the Macintosh. Instead, the driver code is built into each debugger. There are many debuggers available, each oriented to a specific connectivity, such as SNA•ps 3270, SNA•ps APPC, ADSP, and Async to list a few. If the debugger works with the DAL Preferences file, then the Host installation and database access can be tested. The installation of Macintosh DAL drivers has not been verified.

The only way to verify the installation of the DAL Server on the AS/400 with a midrange terminal is to use the Interactive DAL or IDAL400 diagnostic utility. The midrange terminal user logs on the AS/400 and adds to the Library list, the DAL library (DALLIB is the default). The User them runs the IDAL utility by issuing a DAL specific command, IDAL400. Details on how to proceed with the DALDEMO database is outlined in Chapter 3 of the DAL Server for AS/400 Installation Guide.

SNA•ps Error Codes

The DAL Client driver attempts to access a SNA•ps APPC gateway using the directions found in the DAL Preferences file. If all entries are correct and the gateway is operational, the connection to the SQL/400 database is successful. If the connection fails, the DAL Tester and DAL debugger return to the user SNA•ps APPC Result codes. These codes are reported in a format of Major Code -X, Minor Code -Y, or just -X, -Y. Below is a partial list of the most common error codes encountered by DAL users. The complete list is in the SNA•ps APPC Programmers Reference Guide, available from APDA.

Major Code	Minor Codes	Description
1	2	Local LU ID invalid
1	11	Local LU name null
1	12	Bad open gateway type
1	30	Remote LU name null
1	31	Mode name null
1	32	Remote program name null
2	6	Session not available to allocate
2	10	Named Gateway not found on AT Net
2	11	Gateway unavailable (limits reached or PU inactive)
2	12	Specified local LU not on gateway
2	13	Local LU limits reached
5	1	Remote program not available (no retry)
5	2	Remote program not available (retry)
5	3	Conversation not supported by remote LU or program
5	8	Program name not recognized at Remote LU

DAL Server for AS/400 Support Q & A

Revised: 1/25/93
Security: Everyone

DAL Server for AS/400 Support Q & A

==========

Article Created: 25 January 1993

TOPIC ----------

This article answers often-asked technical support questions relating to DAL Server for AS/400.

DISCUSSION ----------

Q: On what media is the DAL Server code shipped to customers?
A: Customers can specify 1/4-inch cassettes or 1/2-inch 9-track reel tape.

Q: Who can install the DAL Server modules on the AS/400?
A: Any user with SECOFR (Security Officer) capability.

Q: How long does it take to install the DAL Server modules on the AS/400?
A: Total time to install from tape is about 10 minutes. The time to deal with the DALENV file configuration and enrolling authorized DAL users depends on the complexity of the host environment.

Q: Is there a way to verify that the DAL Server is installed on the AS/400?
A: With any midrange terminals attached to the AS/400, a user can run IDAL400 to verify access to the AS/400 databases. Since IDAL400 is a separate application, it cannot verify the normal DAL Server code. The only way to verify the DAL Server on the AS/400 is to access the server transaction program via an APPC gateway.

Q: How can the DAL Macintosh driver installation be verified?
A: First, use the DAL Installation Checker to verify that the proper revision level of drivers is installed in the Macintosh. Next, use the debugger to verify DAL Preferences and Host DAL Server connectivity. Finally, use the DAL Tester to check out all aspects of the DAL connection.

Q: What is the most common error users will encounter with the DAL Server testing?
A: Users must enter UserID and Password in uppercase (CAPITAL) letters. The DAL client driver does not convert lowercase letters to uppercase letters (like terminal emulators) and the AS/400 understands only upper-case entries.

Q: Can a user attach to the DAL AS/400 Server from LANs?
A: The DAL Client uses AppleTalk ADSP protocols to reach the SNA gateway machine. DAL calls can be passed over LocalTalk, Ethernet, and Token Ring LANs.

Q: What SNA gateway is needed to allow DAL client access to the AS/400?
A: An Apple SNA•ps APPC gateway is required. This gateway can be attached to the AS/400 either by Token Ring or Serial SDLC connections.

Q: Can any Token Ring or SDLC card run a SNA•ps gateway?
A: SNA•ps gateways run only on Apple MCP cards: either the Apple Token Ring 4/16 NB Card, or the Apple Serial NB Card.

Q: How is the DAL Server solution purchased?
A: The DAL Server, SNA•ps Gateway, and required NuBus cards can be sold by an Apple Sales office, or Apple Networking & Communications dealers. And the SNA•ps gateways and cards can be purchased through the Apple Catalog.

DAL: Basic Technology Concepts

Revised: 7/27/93
Security: Everyone

DAL: Basic Technology Concepts

==========

Article Created: 25 January 1993
Article Reviewed/Updated: 26 July 1993

TOPIC ----------

This article describes the basic technology concepts behind Data Access Language (DAL).

DISCUSSION ----------

Databases have become an essential part of most small and large business operations. It is in a database that information about customer payments, outstanding orders, and manufacturing information is stored, updated, and queried.

Databases follow several standard formats: hierarchical, network, and relational. Hierarchical and network databases have defined relationship paths which must be known and used to search for data. A relational database has no predefined access path, but can be queried in almost any way as defined by the user. The flexibility offered by relational databases comes about because of Database Management System (DBMS) design and industry-standard query languages, such as SQL.

Files are containers of data that are controlled by the host Operating System (OS). The most common file type is a flat file. Flat files have no defined access paths and require scanning the entire file to locate the desired data. Some DBMS can access both databases and flat files.

DBMSs that use SQL to access relational databases have appeared from many vendors in the last decade. These include Oracle, The Ask Group Ingres Products, Sybase, Informix, IBM's DB2 and SQL/DS, DEC's Rdb, Netware SQL, and Tandem's NonStop SQL. These products provide access to different database structures running on different vendor hardware using vendor supplied host operating systems. Each product uses a different "client-server" model with different application programming interfaces (APIs) for client applications

running in personal computers. The connection matrix is further complicated by the variety of connectivity options available to PC users: LAN, TCP/IP, 3270, APPC, and asynchronous to name a few.

Ease of access to database information is a major product differentiator for vendors of personal computers. The vendor who can offer a universal client-server solution which uses a common interface across a large number of hosts and desktop platforms clearly has a selling advantage in business markets.

Apple's Data Access Language (DAL) product, available since 1988, offers a solution that has been embraced by many businesses worldwide. DAL creates a complete client-server environment with both DAL client software running in personal a computer (Macintosh or DOS) and DAL server software running on the host system, where the data and the DBMS reside. The DAL environment can be partitioned into four specific areas: Client machine, physical network, host system, and the databases. The Client machine contains the DAL client, which offers a standard API to either commercially available or in-house developed client (end-user) applications. The DAL client software handles working with the underlying network drivers (APPC, 3270, TCP/IP, or ADSP) to establish connection through the physical network.

The host system issues are taken care of by the Apple-supplied DAL server. The DAL server is a program, running on the host system, which translates the DAL formulated request (sent by the client) into the specific dialect of SQL of the target DBMS. The DAL server tasks include doing the translation, communicating the request to the target DBMS, processing the results provided by the DBMS, and sending them back to the client. The databases are all accessed through the DBMS running on the host system. DAL is especially interesting to customers with multiple DBMS running on the same hosts or on different hosts in the same corporation. DAL provides the same standard interface and method of operation to the client user, no matter which DBMS is actually running on the host system.

StyleWriter II & Macintosh: Grayscale Needs Color QuickDraw 1/93

Revised: 2/23/93
Security: Everyone

StyleWriter II & Macintosh: Grayscale Needs Color QuickDraw 1/93

==========

Article Created: 26 January 1993

TOPIC ----------

I have connected a StyleWriter II to a Macintosh Plus and I am trying to print a grayscale document. I cannot select grayscale in the Print Dialog box.

DISCUSSION ----------

You can't select grayscale printing for the StyleWriter II unless your Macintosh system has Color QuickDraw support in ROM.

In most cases, the Image selection (which allows you to choose between Black and White or Grayscale) will be grayed out when you open the Print Dialog box. In some cases, you can select Grayscale or Black and White, but you will get an error message if you select Grayscale. All documents will print in black and white mode.

The following Macintosh systems do not have Color QuickDraw in ROM:
Macintosh Plus
Macintosh SE
Macintosh Portable
Macintosh Classic
Macintosh PowerBook 100

Workaround

Here's a workaround if you have a Macintosh without Color QuickDraw and you want to print grayscale documents:

Connect your StyleWriter II to a Macintosh that has Color QuickDraw in ROM, then share the StyleWriter II over a network. You can then print grayscale documents over the network from any Macintosh.

A/UX: VT102 Man Page Error

Revised: 1/26/93
Security: Everyone

A/UX: VT102 Man Page Error

==========

Article Created: 25 January 1993

TOPIC ----------

This article corrects an error in the man page for VT102 terminal tool. The error is in the man page, both on-line and in the A/UX 3.0 Programer's Reference, Section 7, VT102, page 14.

DISCUSSION ----------

Near the end (long man page) it states: When sending Escape-Left square bracket-lower case C, (esc[c), that the VT102 tool should respond with:

   Escape-Right bracket-?6c, (esc]?6c)

The wrong bracket type is specified.

The correct sequence is:

   Escape-Left bracket-?6c (esc[?6c)

DAL: Rdb V4.1 Requires Databases Format Conversion

Revised: 1/26/93
Security: Everyone

DAL: Rdb V4.1 Requires Databases Format Conversion

==========

Article Created: 25 January 1993

TOPIC ----------

We just upgraded our Rdb/VMS database to version 4.1. When we try to access the DALDEMO database from idal, we get the message:

```
Error -10207 (-1) daldemo ()
```

Message is "network", line 1: RDB-F-WRONG_ODS, the on-disk structure of database filename is not supported by version of facility being used -RDMS-F-ROOTMAJVER, database format 40.0 is not compatible with software version 41.0.

What went wrong?

DISCUSSION ----------

This is not a DAL problem. It is a compatibility problem for databases created before Rdb/VMS V4.1. You must use the Rdb/VMS Management Utility (RMU) to convert existing Rdb/VMS to a format compatible with Rdb/VMS V4.1 software.

You can convert V3.0 and higher databases using the RMU/CONVERT command. The VMS SYSPRV privilege is required to convert databases unless RMU has been installed with SYSPRV.

To convert the DALDEMO database, enter the following commands at the $ prompt:

```
$ SET DEF MSAD$SYSTEM:
$ RMU/CONVERT DALDEMO
```

RMU will confirm if you are satisfied with the backup of the database, then

go on and convert the structure level to the new format.

MacX: X-Client Access For Macintosh Software (2/93)

Revised: 2/4/93
Security: Everyone

MacX: X-Client Access For Macintosh Software (2/93)

==========

Article Created: 26 January 1993

TOPIC ----------

Does MacX implement local X-Client access for Macintosh software such as MacWrite or Word? That is, can a person run MacWrite as an X-client (on a MacX Server) so that they can have access to it from another Macintosh?

Pieces involved: MacX Server with MacWrite. A Macintosh hooked up to the Server that wants to run MacX from the server.

DISCUSSION ----------

There seems to be some confusion as to what MacX allows you to do. The MacX 1.2 product is a full X Window System, Version 11, Release 4 server that is compatible with Macintosh system software version 7.1. You can also use MacX 1.2 on a Macintosh computer running system software version 6.0.5 or later.

MacX will allow xclients to display on a Macintosh, not a Macintosh application to display on another X Window server.

Please note that in the X Window System, the "Server" is the display where the windows are viewed and the "client" is the program being displayed.

To do what you want to do, you need a program that will turn a Macintosh into an X Window client. Two such programs are available:

• XGator, by Cayman Systems, Inc.

• XPort, by Perfect Products

Both products require a dedicated Macintosh for each X Window Server where you want the Macintosh Desktop Available. Both programs display the

Macintosh Desktop inside an X Window. You then have remote access to the Macintosh where the program is running as if you were sitting in front of it. (This is very similar to what the program Timbuktu does in the Macintosh environment.) Please keep in mind that the performance will be very dependent on the type of Macintosh being used to run the XPort or XGator program, the network traffic, and the X Window server where the Macintosh Desktop is being displayed.

To locate a vendor's address and phone number, use the vendor name as a search string.

PowerBook 100: Backup Battery Life

Revised: 5/16/94
Security: Everyone

PowerBook 100: Backup Battery Life

==========

Article Created: 27 January 1993

TOPIC ----------

How long do the PowerBook 100's backup batteries last under normal circumstances, when the main battery is not installed?

DISCUSSION ----------

This depends on system load, temperature, and the history of the backup battery. Remember, the only purpose of the backup battery is to supply the PowerBook 100 with enough power to preserve the data in memory during the short time it takes to change the main battery. It is not recommended for any other purpose.

Macintosh LC III: Description (2/93) (Discontinued)

Revised: 6/3/94
Security: Everyone

Macintosh LC III: Description (2/93) (Discontinued)

==========

Article Created: 9 February 1993

TOPIC ----------

This article describes the features and benefits of the Macintosh LC III.

DISCUSSION ----------

The Apple Macintosh LC III is the most powerful member of the Macintosh LC line of desktop personal computers. It delivers the outstanding performance and versatility you need -- all in a slim-line, modular design and at an affordable price.

The Macintosh LC III is almost twice as fast as the Macintosh LC II. And the Macintosh LC III can support up to 36MB of RAM, so you can work with multiple applications simultaneously, choosing from more than 6,000 Macintosh applications.

To increase your display choices, the Macintosh LC III provides built-in support for a wide range of Apple and third-party displays, including the Macintosh Color Display (14"), the Macintosh Portrait Display (15"), and the Macintosh 16-inch Color Display. And with 512K of on-board video RAM (expandable to 768K), you get more colors than ever before from your monitor without having to purchase an additional video card.

Your hard drive options include 40MB, 80MB, and 160MB capacities, so you'll have plenty of storage space. For graphics-intensive applications, you can add a floating-point coprocessor. AppleTalk networking is built in, so there's no need to buy additional hardware if you want to access printers, or share files with others.

Multiple ports allow you to expand the system with peripheral devices such as high-capacity CD-ROM and hard drives, scanners, and modems. And a processor-direct slot assures fast access to expansion cards if you need

additional capabilities, such as Ethernet networking or Apple IIe emulation.

Product Features

Power and speed

- 25-MHz 68030 microprocessor; 32-bit data bus
- Almost twice as fast as the Macintosh LC II

Memory

- 4MB of RAM, expandable to 36MB

Display

- Supports up to 16-inch Apple displays
- 256 colors, expandable to 32,768 colors

Expansion

- Seven built-in ports for peripheral devices
- Processor-direct slot for additional expansion card
- Socket for optional math coprocessor

Ordering Information

Macintosh LC III 4/80

Order No. M1312LL/A

- Macintosh LC III computer with 4MB of RAM, 512K of VRAM, built-in 1.4MB Apple SuperDrive, and internal 80MB hard disk drive
- Keyboard
- Mouse
- Complete setup, learning, and reference documentation
- System software
- Training disk
- Limited warranty statement

Other Macintosh LC III configurations

- 8MB of RAM
- Internal 40MB or 160MB hard disk
- Without keyboard

Macintosh LC III expansion cards

- Apple Ethernet LC Card
- Apple IIe Card

Macintosh LC III Upgrade Kit (dealer installation recommended)

Order No. M1386LL/A

- Macintosh LC III logic board and hardware upgrade
- System software
- Complete learning and reference documentation
- Limited warranty statement

Security: Everyone

Macintosh LC III: Specifications (2/93) (Discontinued)

==========

Article Created: 9 February 1993

TOPIC ----------

This article gives technical specifications for the Macintosh LC III computer.

DISCUSSION ----------

Microprocessor

- MC68030, 25 MHz clock speed, motherboard clock 25 MHz; 32-bit data bus
- Socket for optional floating-point unit (FPU)
- Integrated Paged Memory Management Unit (PMMU)

Memory

- Comes with 4MB of RAM on the logic board
- Expandable to 36MB by adding one SIMM to a single 72-pin slot
- Includes RAM disk software

Disk drives

- One built-in Apple SuperDrive 1.4MB floppy disk drive
- One internal 40MB, 80MB, or 160MB hard disk
- Optional external AppleCD CD-ROM drive

Video display

Supports several displays, including:
- Macintosh 12-inch Monochrome Display
- Macintosh 12-inch RGB Display
- AppleColor High-Resolution RGB Display (13")
- Macintosh Color Display (14")
- Macintosh Portrait Display (15")

- Macintosh 16-inch Color Display
- Third-party monitors
- VGA monitors

Video RAM (VRAM)

- 512K standard supports:
  - 32,768 colors on the Macintosh 12-inch RGB Display
  - 256 colors on the AppleColor High-Resolution RGB Display (13"), Macintosh Color Display (14"), and Macintosh 16-inch Color Display
  - 256 shades of gray on the Macintosh 12-inch Monochrome Display
  - 16 shades of gray on the Macintosh Portrait Display (15")

- 768K option supports:
  - 32,768 colors on the Macintosh 12-inch RGB Display, AppleColor High-Resolution RGB Display (13"), and Macintosh Color Display (14")
  - 256 colors on the Macintosh 16-inch Color Display
  - 256 shades of gray on the Macintosh 12-inch Monochrome Display and Macintosh Portrait Display (15")

Interfaces

- Internal expansion slot for one Macintosh LC processor-direct expansion card
- SCSI interface for connecting up to six external peripheral devices
- Two serial (RS-232/RS-422) ports
- One video port for color and monochrome displays of various sizes and resolutions
- One sound-output port (monaural) for external audio amplifier or headphones
- One sound-input port for monaural sound input
- One Apple Desktop Bus (ADB) port for a keyboard, mouse, and other devices

Sound Generator

- Monophonic 8-bit digital-analog conversion using 22-kHz sample rate -— capable of driving stereo headphones or other stereo equipment through the sound jack

Keyboard and Mouse

- Several ADB keyboards with numeric keypads available
- Apple Desktop Bus Mouse II

Clock/Calendar

- Custom integrated circuit with long-life lithium battery

Disability Access

- CloseView, Easy Access, and visible-beep software are built in.
- Third-party options provide alternative input and output devices

Power Requirements

- Line voltage: 100 to 240 V AC, RMS single phase, automatically configured
- Frequency: 47 to 63 Hz
- Power: 30 W maximum, not including display power

ADB Power Requirements

- Maximum current draw for all ADB devices: 200 mA (three ADB devices maximum is recommended)
- Mouse draws 10 mA
- Keyboard draws 25 to 80 mA (varies with keyboard model used)

Size and Weight

Main unit:

- Height: 3.2 in. (8.1 cm)
- Width: 12.2 in. (31.0 cm)
- Depth: 15.0 in. (38.2 cm)
- Weight: 8.8 lbs (4.0 kg) varies with internal devices installed

Mouse:

- Height: 1.3 in. (3.3 cm)
- Width: 2.4 in. (6.2 cm)
- Depth: 4.2 in. (10.7 cm)
- Weight: 4.0 oz (0.10 kg)

Operating Environment

- Operating temperature: 50 to 104° F (10 to 40° C)
- Storage temperature: –40 to 116.6° F (–40 to 47° C)
- Relative humidity: 20% to 80% noncondensing
- Maximum altitude: 10,000 ft. (3,048 m)

System Software Requirements

Requires System 7.1 or later and the System Enabler 003.

Ordering Information

Macintosh LC III 4/80

Macintosh LC III: New Processor Direct Slot (2/93)

Revised: 2/4/93
Security: Everyone

Macintosh LC III: New Processor Direct Slot (2/93)

==========

Article Created: 9 February 1993

TOPIC ----------

This article describes the upgraded LC PDS (Processor Direct Slot) on the Macintosh LC III.

DISCUSSION ----------

The Macintosh LC III supports a new kind of LC compatible PDS slot. It is now 114 pins, allowing support for 32-bit bus master cards while also supporting most existing 96-pin cards designed for the Macintosh LC and LC II.

This is achieved by a gap in the connector allowing a 96-pin card to fit. The connector is actually a 120-pin connector with pins 96 through 114 cut out. In profile, it looks something like this:

```
xxxxxxxx       xxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
x      x       x                             x
x      xxxxxxxxx                             x
x                                            x
xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
120    112     106                           1
```

Some cards designed for the Macintosh LC and Macintosh LC II do not work in the Macintosh LC III because of space constraints or because they expect to be 16-bit bus masters.

Check with the manufacturer of a given card to make sure it's compatible with the Macintosh LC III.

TrueType Fonts: Use on PCs and Site License Issues (12/94)

Revised: 12/14/94
Security: Everyone

TrueType Fonts: Use on PCs and Site License Issues (12/94)

==========

Article Created: 27 January 1993
Article Reviewed/Updated: 14 December 1994

TOPIC ----------

With the new Imaging Products (like the Color Printer) Apple ships an expanded set of fonts called the Apple Font Library.

Do I have to purchase Apple Font Packs for each user?

Can the TrueType files be legally converted to MS-DOS TrueType format (via an available shareware package called TT Converter) for use with Windows 3.1 users who may be sharing a LaserWriter Pro, for example?

DISCUSSION ----------

The licensing agreement for the TrueType fonts that ship with the various printers covers a single user. Other users can access some of the fonts via system software, but must purchase the font pack if they want to use all the available TrueType fonts that ship with the printers.

You can't legally convert the fonts to MS-DOS TrueType format. Using a Macintosh-to-Windows font conversion application with a TrueType font isn't covered under the licensing agreement, and isn't legal at this time. We realize that this creates an awkward situation for printers installed for many users, and in mixed environments. Apple is working on a site licensing agreement.

Monotype Typography sells cross-platform TrueType font sets for the Macintosh and PC. They have identical font sets for both environments.

Macintosh Operating System: Maximum Volume Size (10/96)

Revised: 10/31/96
Security: Everyone

Macintosh Operating System: Maximum Volume Size (10/96)

==========

Article Created: 26 January 1993
Article Reviewed/Updated: 31 October 1996

TOPIC ----------

We have been seeing some strange results when trying to use volumes larger than 2 GB. What is the maximum volume size supported by the Macintosh operating system?

DISCUSSION ----------

Prior to System 7.5, the Macintosh operating system did not support volume (not drive) sizes greater than 2 GB. System 7.5 increased that limit to 4 GB and System 7.5.2 (and later) increases that limit to 2 terabytes on some computers, including:

- PowerBook 190, 1400, 5300 series and Duo 2300c/100.
- Macintosh Performa 5400 and 6400 series and 6360/160
- Power Macintosh 5400, 6400, 7200, 7500, 7600, 8500, and 9500 series
- Workgroup Server 7250/120 and Workgroup Server 8550 series

With versions of the Macintosh operating system previous to System 7.5 we recommend making the volume sizes slightly less than 2 GB to ensure that you do not run into any limitations.

This means that if you have a hard disk drive with a formatted capacity larger than the 2 GB, you must partition it into multiple volumes smaller than 2 GB. Currently, we have found that a partition size at least 1 MB smaller than 2 GB seems to work acceptably.

Possible symptoms of volumes equal to, or larger than the 2 GB limit include:

• Negative file sizes

• Inability to copy files because "More space is needed" even though plenty of space is available.

- Similar symptoms on Novell (or other) servers when the volumes published over the network are larger than 2 GB.

This is a hard limitation. There are no workarounds other than partitioning the drive into multiple volumes or updating your computer and any client computers that may log on to the volume to System 7.5.x.

Three Fonts that Print Incorrectly (7/93)

Revised: 7/16/93
Security: Everyone

Three Fonts that Print Incorrectly (7/93)

==========

Article Created: 28 January 1993
Article Reviewed/Updated: 16 July 1993

TOPIC ----------

We've had problems printing Helvetica, Helvetica Narrow, and New Century SchoolBook. The fonts may appear correctly on screen, but don't print correctly. It usually becomes apparent with recent System 7.1 upgrades or after installing New Helvetica Narrow or New Century SchoolBook fonts.

DISCUSSION ----------

Symptoms

Most users will see these problems after upgrading to System 7.1 or after installing N Helvetica Narrow or New Century SchoolBook. We haven't seen these problems under System 6, but we haven't tested it either.

- Glyphs appear correctly on screen, but print incorrectly for Helvetica, Helvetica Narrow, and New Century SchoolBook. For example, a bullet (option-8) or (•) appears on screen but a yen symbol (option-y) or (¥) prints on the printer. Another example are smart quotes (option-[, shift-option-[) or (“”) appear on screen but a blank space prints on the printer.

- There's a spacing problem associated with Helvetica when N Helvetica Narrow is present, but NOT in the same suitcase. What appears on the screen in any application when Helvetica Bold is selected is N Helvetica Narrow Bold. When printing to any PostScript LaserWriter, the line length and word spacing are incorrect because the LaserWriter uses Helvetica, but the program that formatted the text uses N Helvetica Narrow in place of Helvetica even though Helvetica is selected in the Font menu.

  The appearance on the printed page shows words with spacing too large between them, and lines that are cut off on the right side of the page.

This happens because the Helvetica font characters are wider than the Narrow Helvetica characters used by a program to format word spacing and line lengths.

Using the LaserWriter 8.0 driver causes the printed page to not have cut off line endings. It seems to crunch the word and characters together on each line to make it fit the page width, but the printed page doesn't match what's on the screen.

Fonts Affected and Their Sources

These are the fonts affected:

- Helvetica
- Helvetica Narrow
- New Century SchoolBook

These fonts usually come from the LaserWriter II 5.0 disks. Also, you'll find them on disks shipping with the following three printers:

- Original StyleWriter
- LaserWriter IISC
- LaserWriter IIf or IIg

Please note that none of these are currently shipping products.

Workaround

The workaround is to reinstall an unaffected font (either bitmap or TrueType). This updates the 'FOND' resource of the affected family, and corrects the problem. You can use a bitmap font from the printer disks for Helvetica Narrow and New Century Schoolbook. You will need to find a Helvetica font from some other source such as system disks.

Article Change History:
07/16/93 - Revised with detailed sections on symptoms, fonts involved, and one workaround.
06/29/93 - Updated to include another symptom
06/04/93 - Updated to show which LaserWriters are affected
04/22/93 - Updated to include sources for replacement fonts

LaserWriter Pro: Printing from Windows Over a Network (1/93)

Revised: 2/4/93
Security: Everyone

LaserWriter Pro: Printing from Windows Over a Network (1/93)

==========

Article Created: 28 January 1993

TOPIC ----------

Will the Microsoft Windows and MS/DOS drivers included with the LaserWriter Pro printers print over a network (such as Ethernet), or will they only allow printing to the LaserWriter Pro's serial or parallel ports?

DISCUSSION ----------

The print drivers included in the LaserWriter Pro Windows diskette alone do not provide the capability of network access (Ethernet, for example) from a PC. These drivers will provide PostScript output from a PC connected through serial or parallel cabling.

To gain direct network access using these drivers, customers need additional network access software. An example of this software is Farallon's PhoneNetPC 3.0, which is part of the PhoneNetTalk PC card.

Quadra 800 and Quadra 950 Compared (2/93)

Revised: 2/4/93
Security: Everyone

Quadra 800 and Quadra 950 Compared (2/93)

==========

Article Created: 9 February 1993

TOPIC ----------

What are the differences between the Macintosh Quadra 800 and the Macintosh Quadra 950?

DISCUSSION ----------

The Quadra 800 runs more than 30 percent faster than a Quadra 700, which it replaces -- and at a more affordable price. (The Quadra 950 remains on the price list.)

Although the Quadra 800 and Quadra 950 have the same 68040 processor, both operating at 33 megahertz, the 950 has greater expansion options than the Quadra 800. For example, you can expand the DRAM in the 950 to 256MB, compared to 136MB in the Quadra 800. The Quadra 950 has two additional NuBus expansion slots as well.

The Quadra 800 may run 5 to 10 percent faster than a Quadra 950 in certain applications, largely due to memory and video management improvements via custom integrated circuits (ICs). However, because it has greater memory and expansion capabilities, a fully configured Quadra 950 may outperform the Quadra 800 in certain applications.

At-a-glance comparison: Quadra 800 and 950

	Quadra 800	Quadra 950
Processor	33 MHz 68040	33 MHz 68040
RAM	Up to 136MB interleaved	Up to 256MB
VRAM	2 - 16 bits/pixel	2 - 32 bits/pixel

NuBus	3 slots, 1 PDS	5 slots, 1 PDS
Internal Storage Devices	1 3.5", 1 5.25" (removable)	Up to 4 5.25" devices
Ethernet	Standard	Standard
Hard Disk	230MB, 500MB, 1GB	230MB, 500MB, 1GB
Sound	Mono In, Stereo Out, 44.1 KHz internal CD sound play through.	Mono In, Stereo Out, 44.1 KHz internal CD sound play through.
System Software	System 7.1 w/ Enabler	System 7.1

Macintosh 800,840av, 8100,8500: Internal SCSI Devices (11/95)

Revised: 11/27/95
Security: Everyone

Macintosh 800,840av, 8100,8500: Internal SCSI Devices (11/95)

==========

Article Created: 9 February 1993
Article Reviewed/Updated: 27 November 1995

TOPIC ----------

How many internal SCSI devices can be installed in the Macintosh Quadra 800, 840av and Power Macintosh 8100 and 8500 series computers?

DISCUSSION ----------

Because of space limitations, up to three internal SCSI devices can be placed into these computers. The primary variables are the type and capacity of drives you want.

- One 3.5-inch hard disk.
- One half-height 5.25-inch device such as an internal CD-ROM player.
- One full- height 3.5-inch device such as a removable cartridge drive, DAT drive, or another SCSI hard disk.

IMPORTANT: Modification of the internal components of your computer may void your warranty. Contact an Apple-authorized service provider for installation assistance.

Article Change History:
27 Nov 1995 - Added additional computers.

Quadra 800: Monitor Support (3/94)

Revised: 3/11/94
Security: Everyone

Quadra 800: Monitor Support (3/94)

==========

Article Created: 9 February 1993
Article Reviewed/Updated: 11 March 1994

TOPIC ----------
What monitors does the Macintosh Quadra 800 support, and at what bit depth?

DISCUSSION ----------

The baseline VRAM configuration of the Quadra 800 is 512K. The maximum amount of installable VRAM is 1MB. The Quadra 800 supports up to two banks of VRAM, the same 128K by 16 VRAM SIMM used in previous Quadra models. Unlike the Quadra 950, the Quadra 800 dos not support video convolution.

The baseline configuration of 512K VRAM supports:

- 16 bits per pixel on the Macintosh 12" RGB Display
- 8 bits per pixel on the Macintosh 12" Monochrome Display, the AppleColor 13" RGB Display, Apple Color Display (14" display), and the Apple 16" Color Display.
- 8 bits per pixel on 640 x 480 NTSC, 768 x 576 PAL, and 800 x 600 SVGA monitors.
- 4 bits per pixel on the Apple Macintosh Portrait Display and Macintosh 21" Color Display.

The 1MB VRAM configuration adds support for:

- 8 bits per pixel on the Macintosh 21" Color Display.
- 16 bits per pixel on the Apple Color Display (14") and the Apple 16" Color Display.
- 16 bits per pixel on 640 x 480 NTSC, 768 x 576 PAL, and 800 x 600 SVGA

monitors.

Article Change History:
11 March 1994 - Corrected pixel depth of 21" Color Display with base and expanded VRAM.

Quadra 800: Description (Discontinued 3/94)

Revised: 3/14/94
Security: Everyone

Quadra 800: Description (Discontinued 3/94)

==========

Article Created: 9 February 1993
Article Reviewed/Updated: 14 March 1994

TOPIC ----------

This article describes the Macintosh Quadra 800 which Apple discontinued on 14 March 1994.

DISCUSSION ----------

The Macintosh Quadra 800 features a 33 MHz Motorola microprocessor, accelerated graphics architecture, and improved SCSI and NuBus capabilities.

The key features of the Quadra 800 are:

- Motorola 68040, 33 MHz
- 8MB DRAM standard, expandable to 136MB DRAM, using 32MB SIMMs
- Supports up to 16 bits per pixel (bpp) on all Apple displays
- Improved I/O with a clock frequency of 33 MHz
- Up to three internal SCSI devices, including the AppleCD 300i or third-party internal CD-ROM drive
- Three NuBus slots
- Built-in Ethernet
- Mini tower design
- System Software 7.1 and System Enabler 040
- System configurations of 230MB, 500MB, and 500MB/CD available at introduction

Form Factor

The Macintosh Quadra 800 computer has a new form factor, called a mini-tower, which can be either desk or floor standing. The Quadra 800 can support up to three internal SCSI devices.

The Macintosh Quadra 800 can have:

- One internal 3.5 device (hard disk)
- One internal 5.25 removable device (can be CD-ROM or Syquest drive)
- One internal 3.5 removable device (3.5 removable media, tape drive, or another hard disk)

Motorola MC68040 Microprocessor

Central to the Quadra 800 is the processor chip from Motorola, the 68040 (040) running at 33 MHz. This is the same processor included in the Quadra 950.

The 68040 is mounted to the logic board with a socket, and a heat sink is clipped onto the socket rather than glued to the 040. This allows easier servicing if required. It's important to close the case when the Quadra 800 is running to assure proper cooling of the 040.

DRAM Support

The Quadra 800 uses the industry-standard 60ns 72-pin SIMMs. Current Apple SIMMs won't work in the Quadra 800. The Quadra 800 supports memory interleaving. Any SIMM can go into any of the four SIMM slots in any order. It doesn't support 1MB, 2MB, or 64MB 72-pin SIMMs.

Integrated Circuit Improvements

The ten custom integrated circuits (ICs) in the Quadra 700 have been reduced to three major ICs in the Quadra 800. The KIWI IC controls NuBus; the IOSB IC integrates the I/O controller, SWIM II, VIAs, Sound and the I/O Bus; and the DJMEMC IC integrates the memory controller, frame controller, and bus arbitration. The result is improved video and memory management, improved input/output of all ports and drives, and faster NuBus throughput.

Configurations and What's in the Box

At introduction, there are three Macintosh Quadra 800 configurations:

- 8/230MB
- 8/500MB
- 8/500MB/CD

Each unit includes a power cord, keyboard cable, mouse, microphone, and system software.

System software includes System 7.1, System Enabler 040, Color Macintosh Basics, QuickTime 1.5, and HyperCard Runtime.

Those units that include an AppleCD 300i will receive all system software on a bootable CD-ROM, which can double as a rescue disk. A CD Sampler pack is also included (the number and titles of the pack will vary).

The documentation includes:

- Getting Started with your Macintosh Quadra 800
- Macintosh User's Guide
- Compatibility list

Upgrades

No upgrade path for Macintosh Quadra 700 owners is offered.

Article Change History:
14 March 1994 - Added Discontinued information to title and topic lines.
9 March 1993 - REVISED, To remove a statement that any SIMM (4MB and higher) can go into any of the four SIMM slots in any order. It doesn't support 1MB, 2MB, or 64MB 72-pin SIMMs.

Macintosh Quadra 800: Specifications (Discontinued)

==========

Article Created: 9 February 1993
Article Reviewed/Updated: 21 October 1994

TOPIC ----------

This article gives the technical specifications for the Macintosh Quadra 800 computer, which was discontinued on 14 March 1994.

DISCUSSION ----------

Microprocessor

- Motorola 68040, 32-bit architecture, 33 MHz clock speed; main logic board clock 33 MHz
- Integral Paged Memory Management Unit (PMMU), Floating Point Unit (FPU), and 8-kilobyte cache architecture

I/O Speed

- 25 MHz

Memory

- Comes with 8MB of RAM standard and four memory expansion slots for 60ns 72-pin SIMMs. Current Apple SIMMs don't work in the Quadra 800. It doesn't support 1MB, 2MB, or 64MB 72-pin SIMMs.
- Expandable to 136MB of RAM by installing 32MB SIMMs in each of the four SIMM slots.

Disk Drives

- Built-in Apple SuperDrive 1.4MB floppy disk drive
- 230MB or 500MB internal Apple SCSI hard disk drive (optional)
- Support for two internal SCSI devices, such as a CD-ROM or DAT drive, or SCSI hard disk drive (several capacities available)

Video Display

- Up to 16 bits per pixel (bpp) video support for all Apple monitors standard (Macintosh Color Display (14-inch) Macintosh 16" Color Display and require 1MB VRAM.)

- Supports all Apple monochrome and color monitors, including:
  - Macintosh 12" RGB Display
  - Macintosh 12" Monochrome Display
  - AppleColor High-Resolution RGB Monitor
  - Macintosh Color Display (14" display)
  - Apple Macintosh Portrait Display
  - Macintosh 16" Color Display
  - Macintosh Two-Page Monochrome Monitor
  - Macintosh 21" Color Display

- Supports some other non-Apple monitors, including VGA, SVGA, NTSC and PAL 19" monitors.

Video RAM

- 512K VRAM, upgradable to 1MB for display of more colors or shades of gray.

Interfaces

- One Apple Desktop Bus (ADB) port, supporting a keyboard, mouse, and other devices daisy-chained through a synchronous serial bus.
- Two serial (RS-232/RS-422) ports, 230.4 kilobits per second maximum (up to 0.920 megabits per second if clocked externally)
- SCSI bus interface
- Video port to support RGB and monochrome monitors of various sizes and resolutions
- Three internal NuBus expansion slots.
- One 68040 PDS (processor-direct slot) provides access to the CPU for highest possible performance.
- Stereo sound output port capable of delivering sound to both channels of a stereo device
- Sound input port for monaural sound input.
- Two audio line input ports (stereo input is mixed to a monophonic signal)
- AUI-15 Ethernet connector

Keyboard

- Supports all ADB (Apple Desktop Bus) keyboards.

Mouse

- Apple Desktop Bus Mouse II; mechanical tracking, optical shaft, or contact encoding.

Sound Generator

- Custom sound chip drives stereo miniature phone jack headphones or stereo equipment.

Clock/Calendar

- Custom chip with long-life lithium battery.

Microphone

- Electret, omnidirectional; output voltage is 4 millivolts, peak-to-peak, at normal volume.

Disability Access

- CloseView, Easy Access, and visible beep included with system software. These built-in features and third-party options provide alternative input and output tools for people with disabilities.

Electrical Requirements

- Line voltage: 100 to 240 volts AC
- Frequency: 50 to 60 Hz, single phase
- Power: 200 watts maximum, not including monitor power

ADB Power Requirements

- Maximum current draw for all ADB devices: 200 milliamps
- Mouse draws 80 milliamps.
- Keyboard draws 25 to 80 milliamps, depending on the keyboard model used.

Operating Environment

- Operating temperature: 50 to 104° F (10 to 40° C)
- Storage temperature: -40 to 116.6° F (-40 to 47° C)
- Relative humidity: 5% to 95 noncondensing
- Maximum altitude: 10,000 ft. (3,048m)

Size and Weight

- Main unit
  - Height 14.25 inches (46.2 cm)
  - Width 8.9 inches (22.5 cm)
  - Depth 16 inches (40.5 cm)
  - Weight 24 lb. (16.7 kg) varies with disk drive options installed

- Mouse
  - Height 1.1 inches (2.8 cm)
  - Width 2.1 inches (5.3 cm)
  - Depth 3.8 inches (9.7 cm)
  - Weight 6 oz. (.17 kg)

Noise Level

```
-----------
  < 40 db (floor standing position) measured from the seated operator
  position.

Article Change History:
21 Oct 1994 - Corrected dimension specs.
18 Mar 1994 - Added "Macintosh" to title.
14 Mar 1994 - Added discontinued information announced 14 March 1994.

Centris & Quadra Families: Bootable CD-ROM (7/94)

Revised: 7/13/94
Security: Everyone

Centris & Quadra Families: Bootable CD-ROM (7/94)

==========

Article Created: 9 February 1993
Article Reviewed/Updated: 13 July 1994

TOPIC ----------

The Macintosh Centris and Quadra models that ship with a factory-installed internal CD-ROM drive are bundled with a bootable CD-ROM. This article describes that bootable CD-ROM.

DISCUSSION ----------

The CD-ROM includes the current versions of System Software, HyperCard Player, QuickTime, CD Setup, At Ease, and Color Macintosh Basics.

This approach has several advantages:

- It offers the customer one source for all system software resources, including System Software with the System Enabler, QuickTime, Macintosh Basics, and CD Setup.

- You can install software directly from the CD, or make a set of backup floppies from the CD. The CD uses an At Ease interface to simplify these tasks.

However, the CD is not meant to be a permanent startup disk, but used as a backup and archive of system software.

There are two ways to start up from the Install Me First CD once it has been inserted into the CD-ROM drive:

- Select the CD-ROM as the startup device in the Startup Disk control panel and restart.

- Bypass the internal hard disk by starting up with the Command-Option-Shift-Delete key combination held down.

NOTE:
Another reference for installation is the System Software Installation & Backup guide that ships with Macintoshe computers containing CD-ROM drives. Make sure to use the disc that ships with your system as different discs contain different System Enablers.

Article Change History:
13 Jul 1994 - Reviewed for technical accuracy.
23 Sep 1993 - Included how to boot from the Install Me First CD
29 Jul 1993 - Modified article to include all Centris and Quadra models.

Centris and Quadra Computers: Internal CD-ROMs (1/95)

Revised: 1/4/95
Security: Everyone

Centris and Quadra Computers: Internal CD-ROMs (1/95)

==========

Article Created: 9 February 1993
Article Reviewed/Updated: 4 January 1995

TOPIC ----------

Can you install an internal CD-ROM drive in a Macintosh Centris or Macintosh Quadra computer?

DISCUSSION ----------

All Macintosh Quadra and Centris computers, except Quadra 605 and Quadra 700 computers, have space for an internal CD-ROM drive or other 5.25-inch full-height device.

Although various configurations of Centris and Quadra computers are available with the AppleCD 300i factory-installed, Apple offers several AppleCD 300i upgrade kits:

Product Number:	Description:
B1332LL/A	AppleCD 300i Drive Kit, Centris 610 & 660AV
B1329LL/A	AppleCD 300i Drive Kit, Centris 650
B1328LL/A	AppleCD 300i Drive Kit, Quadra 900 & 950
B1330LL/A	AppleCD 300i Drive Kit, Quadra 800 & 840AV

Article Change History:
04 Jan 1995 - Added, except Quadra 605 and 700 computers.
18 Aug 1993 - Revised and retitled to include all Centris and Quadra computers and accompanying AppleCD 300i kit information.

Centris 610 & 650, Quadra 800: Memory Interleaving & DRAM (7/94)

Revised: 7/28/94
Security: Everyone

Centris 610 & 650, Quadra 800: Memory Interleaving & DRAM (7/94)

==========

Article Created: 5 February 1993
Article Reviewed/Updated: 28 July 1994

TOPIC -----

The Macintosh Centris 650 and Quadra 800 support memory interleaving. What is memory interleaving, and what DRAM can I use?

In this document, the Centris 650 and Quadra 650 can be used interchangably.

DISCUSSION -----

Memory Interleaving occurs on the Centris 650 and Quadra 800 computers when same-size SIMM pairs are used: for example, two 8MB SIMMs. This allows the memory subsystem to perform certain operations faster. Basically, it allows the memory subsystem to write to the same memory address in different banks of memory before incrementing the address. Depending on how memory intensive the application, this can improve performance 5 to 10%. A system in the interleaved configuration will perform at its highest level.

The Centris 610, Centris 650, and Quadra 800 use 72-pin DRAM SIMMs, which are widely available in the Intel market and offer a full "bank" of DRAM on one SIMM.

The Centris 610 and 650 use 80ns SIMMs, and the Quadra 800 uses 60ns SIMMs. They are available in single- and double-sided formats, and are offered in many different sizes:

- 4MB (single sided, offered by Apple)
- 8MB (double sided, offered by Apple)
- 16MB (single sided)
- 32MB (double sided)

Here are the 72-pin SIMMs that these computers DON'T support:

- 1MB

- 2MB
- 64MB

Note: All of these systems -- Centris 610, Centris 650, and Quadra 800 -- have flexible memory systems. Any supported SIMM size can go into any SIMM socket in any order.

Do NOT use composite memory with any 610, 650 or 800 Macintosh.

Article Change History
28 Jul 1994 - Revised formatting, added Quadra name to document.
09 Mar 1993 - Removed statement that any size SIMM (4MB or greater) can go into any SIMM socket in any order, because 1MB, 2MB, and 64MB SIMMs aren't supported.

Centris 610 & 650, Quadra 800: NuBus Information (7/94)

Revised: 7/28/94
Security: Everyone

Centris 610 & 650, Quadra 800: NuBus Information (7/94)

==========

Article Created: 9 February 1993
Article Reviewed/Updated: 28 July 1994

TOPIC ----------

What are the changes in the NuBus implementation in the Macintosh Centris 610, Centris 650, and Quadra 800? How does each system support it?

The information in this article relative to the Centris 610 and Centris 650 is also relevant to the Quadra 610 and Quadra 650.

DISCUSSION ----------

NuBus Implementation

The NuBus implementation in the Centris 610, Centris 650, and Quadra 800 utilizes the same signals used in previous Quadra computers. These NuBus slots utilize many of the features specified in the NuBus90 standard.

NuBus '90 is the 1990 proposal for revision of the IEEE standard for the NuBus (IEEE STD R1196-R-1990). Apple has a representative on the panel designing the new standards, and has had since its inception. The specifications for NuBus '90 are incomplete and still under development, but Apple has implemented the portion of the specifications that are completed, and will be updating the implementation as the specs expand and stabilize. The NuBus slots in the Centris 610, Centris 650, and Quadra 800 provide the following new features described in that proposal:

- Low current at +5 V is available on the new STDBYPWR pin when main power is off and the AC cord is plugged in.

- New signals /TM2, /CLK2X, and /CLK2XEN support block transfers at double the standard rate (20 MHz). Double-rate block transfers are supported between NuBus cards, but does not transfer to or from the main memory (this remains at 10 MHz).

- NuBus '90 defines new signals SB0 and SB1 for a serial bus on the formerly reserved pins A2 and C2. The serial bus signals are bused and terminated, but the main circuit board does not drive them.

- NuBus '90 defines new signals /CM0, /CM1, /CM2, and /CBUSY to support a cache coherency protocol. Pins on the NuBus connector are assigned to those signals, but the current systems do not support them.

The following table lists the new signals described in the proposal for NuBus 90.

NuBus '90 signals on the NuBus connector

Pin #	Signal name	Function
A2	SB0 !	High-speed serial bus, defined in P1394 proposal.
C2	SB1 !	High-speed serial bus, defined in P1394 proposal.
B8	/TM2	New transfer mode: requests double-speed transfer.
B9	/CM0 !	For cache-coherency operations.
B10	/CM1 !	For cache-coherency operations.
B11	/CM2 !	For cache-coherency operations.
B24	/CLK2X	Synchronizes double-speed block transfers.
B25	STDBYPWR	Small current at +5 V when main power is off; enables the card to turn main power on by asserting /PFW signal.
B26	/CLK2XEN	If not connected to other NuBus ’90 signals, this line enables /CLK2X driver.
B27	/CBUSY	Used with cache-coherency operations.

! - These signals are not driven or monitored.

CPU NuBus Support

The Centris 610 has one expansion slot, which can be used by a PDS adapter or by a NuBus adapter similar to the one used in the Macintosh IIsi. This expansion slot is a 140-pin dual position edge connector. The NuBus adapter contains the NuBus interface circuitry and has a single NuBus connector.
NuBus cards must follow the small-size NuBus standard: a maximum of seven inches long and use a maximum 10W of power. NuBus cards that follow the seven-inch standard can be used in any NuBus-equipped Macintosh.

The Centris 650 and Quadra 800 each support three NuBus slots, one more than the Quadra 700, that may draw up to 15W each. These NuBus slots are addressed as $C, $D, and $E. The PDS slot lines up with slot $E, either the PDS slot or slot $E may be used -- but not both.

A single chip, the KIWI ASIC, provides the interface between the system bus and NuBus.

For Further Information

For further details on the KIWI ASIC, see the related Tech Info Library article "Macintosh Centris 610, Centris 650, Quadra 800: Custom ICs".

For complete specifications and a discussion of NuBus, refer to Developing Cards and Drivers for the Macintosh Family, third edition.

Centris 610 & 650, Quadra 800: SCSI Termination (7/94)

Revised: 7/28/94
Security: Everyone

Centris 610 & 650, Quadra 800: SCSI Termination (7/94)

==========

Article Created: 9 February 1993
Article Reviewed/Updated: 28 July 1994

TOPIC -----

This article describes the new SCSI termination scheme on the Macintosh Centris 610, Centris 650, and Quadra 800.

The information in this article relative to the Centris 610 and Centris 650 is also relevant to the Quadra 610 and Quadra 650.

DISCUSSION -----

The Macintosh Centris 610, Centris 650, and the Quadra 800 incorporate a new active SCSI termination scheme that is automatically enabled depending on the state of the SCSI bus termination.

Because the Centris 610 and 650 and Quadra 800 can have multiple internal SCSI drives, the length of the internal SCSI bus (PCB traces + cable) requires that both ends of the SCSI bus be terminated.

When a terminated external SCSI chain is plugged into the external SCSI port, the logic board termination near that external port must be disabled. The new termination automatically senses at reset whether the external and internal ports are terminated. If either port is not terminated, then the active termination is enabled. If both ports are already terminated, then the active termination is disabled.

Centris 610 & 650, Quadra 800: A/UX Support 7/94)

==========

Article Created: 9 February 1993
Article Reviewed/Updated: 28 July 1994

TOPIC ----------

Do the Macintosh Centris 610, Centris 650, and Quadra 800 support A/UX?

The information in this article relative to the Centris 610 and Centris 650 is also relevant to the Quadra 610 and Quadra 650.

DISCUSSION ----------

With the release of A/UX 3.0.1 the Centris 650 (with optional FPU) and Quadra 800 support A/UX. Because the Centris 610 lacks an FPU it, therefore, cannot run A/UX (unless there is a FPU upgrade solution from a third party).

Article Change History:
28 Jul 1994 - Added reference to Quadra 610 and 650 to aid in searching.
03 Aug 1993 - Updated to include A/UX 3.0.1

Centris 610 & 650, Quadra 800: Custom ICs (7/94)

==========

Article Created: 9 February 1993
Article Reviewed/Updated: 28 July 1994

TOPIC -----

There are three new custom ICs introduced with the Centris 610, Centris 650, and Quadra 800:

- DJMEMC: Dale & Jay's Most Excellent Memory Controller
- IOSB: Input/Output Subsystem Buffer
- KIWI: NuBus Controller

These three ICs integrate functions provided by the ten custom ICs found on the Quadra 700 logic board. This article describes each of these ICs in detail.

The information in this article relative to the Centris 610 and Centris 650 is also relevant to the Quadra 610 and Quadra 650.

DISCUSSION -----

Note: The Centris 610, Centris 650, and Quadra 800 also include a number of ICs developed for previous Macintosh models. Although not described in this article, they are:

- DFAC: Sound - Input and File
- MC68040: Microprocessor
- AC843: CLUT/DAC
- Antelope: Low cost CLUT/DAC
- MCCS142235: Active SCSI Terminator
- DP8534: Video timing generator
- SONIC: Ethernet controller
- 53C96: SCSI controller

DJMEMC (Dale and Jay's Most Excellent Memory Controller)

DJMEMC is a very large-scale IC that combines functions performed by multiple devices in previous Macintosh designs. DJMEMC attaches to the system bus and provides the control and timing signals for the RAM, ROM, and VRAM. It also controls the logic that controls the system bus arbitrations that provide the video timing and control signals. In summary, key functions provided by the DJMEMC are:

- Address decode
- Bus arbitrator
- Configuration register
- DRAM/ROM controller
- System bus interface
- Video timing
- VRAM controller

DJMEMC also includes a complete video frame buffer controller for a VRAM-based frame buffer which supports high performance graphics. Essentially, all of the DAFB frame buffer controller used in the Quadra 700, 900, and 950 have been incorporated into DJMEMC. Therefore DJMEMC is capable of supporting all of the display options and configurations supported by the Quadra 700, 900, and 950. This frame buffer also makes use of two new devices: the National DP8534 clock generator, and the Antelope CLUT/DAC. The 8534 (not compatible with the DP8531 used by the earlier Quadra computers) generates all video clock frequencies needed, up to and including 100 MHz. Antelope is a significantly cost-reduced version of the AAC, and does not include support for 24 bpp or Apple convolution. Antelope is pin- and software-compatible with the AAC used by the Quadra 950.

IOSB (I/O Subsystem Buffer)

IOSB performs some of the functionality found in the JDB/Relayer two-chip set used in the Quadra 700, 900, and 950 -- and also integrates a number of the discreet components which were located on the Quadra 700, 900, and 950 I/O bus.

The key functions of the IOSB ASIC are:
- Byte steering
- Bus sizing
- Alternate I/O bus masters
- Device decode logic
- CPU ID register
- Sound
- VIAs
- SWIM2
- Power on circuit
- System watchdog timeout
- Interrupts

Byte Steering: The 68040 does not support data steering. However, the 68030 allows 8-bit and 16-bit slaves to attach to a given byte lane and indicate their port size during cycle acknowledge. Hardware in the 68030 bus interface did the appropriate byte steering. This allows S/W to do byte accesses to consecutive bytes in 8-bit devices like the SCC without any external logic. In order to maintain compatibility with existing software, the IOSB ASIC does byte steering

for 68040 accesses to I/O bus peripherals.

Bus Sizing: The 68040 does not support dynamic bus sizing; it expects accesses to 8-bit and 16-bit ports to be of the appropriate size, that is access.B for 8-bit ports and access.W for 16-bit ports. However, the 68030 allows 8-bit and 16-bit slaves to attach to a given byte lane and indicate their port size during cycle acknowledge. The hardware inside the 68030 does the appropriate number and type of bus cycles to fulfill the request. This allows long word accesses to 8-bit devices, like the SCC. To maintain compatibility with existing software, IOSB does dynamic bus sizing for 68040 accesses to I/O bus peripherals.

Alternate I/O Bus Masters: IOSB allows the SONIC Ethernet controller to be a bus master on the System bus. SONIC drives the System bus snoop control bits (SC1 and SC0) directly, while IOSB drives the TT control lines. The status of these bits is determined by a register within SONIC, and should be initially configured not to snoop.

IOSB does not support true burst transfers to the I/O bus. If a System bus master attempts to burst data to or from an I/O bus slave, IOSB will invoke a 68040 fake burst. This allows use of the MOVE16 instruction for I/O bus data. IOSB itself does not initiate burst cycles on the System bus.

Device Decode Logic: IOSB provides device selects according to the memory maps shown earlier. It provides chip select for all I/O bus devices (that is, Ethernet PROM, patch ROM, SCC, SCSI, and SONIC) and internal IOSB cells (that is, VIAs, SWIM2, sound, and ADB). Note that DJMEMC and KIWI provide their own chip selects.

Sound: IOSB provides a variation of the sound controller used in the Sonora ASIC (used on the Macintosh LC III). However, instead of using DRAM or VRAM for sound I/O buffers, IOSB will internally provide 3K of internal static RAM.

Separate 1-Kbyte buffers are provided for left sound output, right sound output, and mono sound input. Since a sound output buffer is not reused for sound input, IOSB will be capable of providing simultaneous stereo sound output while recording from the sound input port. Sound buffers internal to IOSB are required for maximum software compatibility with Apple and third-party sound drivers.

VIAS:IOSB includes two VIAs, similar to the original Macintosh II. The VIA clock is generated within IOSB. VIA1 is the same VIA cell used in VISA, V8, Sonora, and PSC. It has full Macintosh VIA capabilities. VIA2 is a variation of the cell used in VISA, V8, etc.... This is not a complete VIA, but performs all the functions required from VIA2 (mostly interrupt support and some read/write port bits).

SWIM2:IOSB contains the SWIM2 floppy disk controller. It has full Macintosh SWIM2 capabilities, and is capable of supporting a 2.88MB floppy format.

Power-On Circuit: The Centris 610, Centris 650, and Quadra 800 use the same power-on logic as the Macintosh IIci. However, the portions of the power-on circuitry that do not run off the +5V trickle supply have been moved into the

IOSB ASIC to reduce component count on the motherboard.

System Watchdog Timeout: IOSB includes timeout logic that monitors system bus activity and terminates faulty cycles with a bus error indication. This timer does not run when an access is made to a NuBus device; it assumes that the NuBus controller will include a timer which handles the (longer) NuBus timeout period (25.6 µsec).

IOSB also maintains a watchdog timer for the entire system, including NuBus. This timeout has a longer period than previous timers, and prevents "hanging" while waiting for a response from a damaged or non-existent device. For instance, this timer would catch PDS cards that do not respond to all accesses to NuBus slot E space (see YANCC description for more information on PDS decoding).

Interrupts: IOSB will terminate all 68040 interrupt acknowledge cycles with autovector indication. Like the Quadra 700, 900, and 950, the Centris 610, Centris 650, and Quadra 800 allow separate mappings for different operating systems.

IOSB also provides for multiple modes of operation to support the use of IOSB in future CPUs, and to provide a failsafe mechanism in case of problems during development. These options include:

- Internal/external sound (allows use of the EADSC for higher quality sound output)
- Internal/external SWIM

KIWI

The KIWI ASIC provides the interface between the System bus and NuBus. It combines the functions that were provided by the YANCC ASIC, two bus transceivers, and several discrete driver chips. KIWI provides a complete 68040 bus interface on one side and a complete NuBus interface on the other.

Key functions provided by the KIWI ASIC are:
- Support for all types of single transfers
- One longword deep buffer
- Support for block move transfers for NuBus masters accessing memory on the motherboard
- Pseudo-block transfers from the 68040 to NuBus slaves
- Several of the new functions being defined by NuBus 90 spec

DAL: National Characters Localization in TSO and VTAM (1/93)

==========

Article Created: 28 January 1993

TOPIC ----------

I have a question about National Characters. DAL Tech Note #4 states that version 1.3.6 of DAL supports national characters: is this true? I am currently using both VTAM and TSO; on the DAL VTAM 1.3.5 tape there is a "DALLOCAL" macro which I have customized, but on the DAL TSO 1.3.5 tape I haven't been able to locate the same macro.

DISCUSSION ----------

As for the localization of the code tables, the DAL Tech Note #4 was not quite accurate in the following ways:

- It was actually available for TSO, VTAM and VM as of the 1.3.5 release of the servers. However, it was not quite correct on the tape, hence the note specifying release 1.3.6 which does not exist for TSO, VTAM, or VM. We are including the corrected DALLOCAL member which you should use.

- For the TSO server, the code table and its JCL is located in the DALLOCAL member in the DAL.CLIST library. Do not use the one that came on the tape, use the one included here instead.

We will have the Tech Note updated to clarify the location for the TSO server.

Below is the JCL you should use. Please note the comments/information at the beginning of the JCL. It is very important for TSO servers. The JCL as-is is for VTAM servers.

```
//DALLOCAL JOB ONE,'DAL',MSGCLASS=X                              00000100
```

System 7.1 Multipack: Missing Foreign Operating Systems 2/93

Revised: 2/3/93
Security: Everyone

System 7.1 Multipack: Missing Foreign Operating Systems 2/93

==========

Article Created: 3 February 1993

TOPIC -----

Why is Polska, Bulgarian, Dutch, Romanian, and Magyar system software missing from the System 7.1 Multipack CD-ROM?

DISCUSSION -----

The system software for these countries wasn't ready by the submission deadline. So, the Multipack kit CD was shipped without system software for those countries.

System 6.0.7: Incompatible with PrintMonitor 7.1 2/93

Revised: 2/4/93
Security: Everyone

System 6.0.7: Incompatible with PrintMonitor 7.1 2/93

==========

Article Created: 3 February 1993

TOPIC ----------

I just installed the PrintMonitor 7.1 on a 6.0.7 system. Upon clicking "Set Print Time," the system crashed.

DISCUSSION ----------

PrintMonitor 7.1 went out with the bug you described for users running System 6. The problem won't occur with System 7.

For the time being, we recommend that system 6.x users install PrintMonitor 7.0.1 or 7.0. You can obtain a copy from your dealer. You can also find PrintMonitor 7.0.1 posted on AppleLink. The path is:

Software Sampler
  Apple SW updates
    Macintosh
      Printing Software

You should be aware that when installing with the LaserWriter Pro Series disks, they will always install PrintMonitor 7.1 over the older version. Remember to save a copy of the old PrintMonitor before beginning the installation.

Macintosh LC III: Control Chips (2/93)

Revised: 2/4/93
Security: Everyone

Macintosh LC III: Control Chips (2/93)

==========

Article Created: 9 February 1993

TOPIC ----------

This article describes the Macintosh LC III control chips.

DISCUSSION ----------

SONORA

This ASIC performs timing video generation, sound, peripheral decodes, interrupt, DRAM, VRAM, and miscellaneous glue logic functions. Sonora integrates the functions of many separate chips from the LC II into one package, which helps lower cost and improve reliability.

EGRET

A single chip microcontroller (Motorola 68HC05EG) that performs keyboard scanning, real time clock, ADB interface, and parameter RAM storage. The Macintosh LC III can be reset via the keyboard by holding down the Control and Command keys then hitting the power key. An interrupt is generated by holding just the Command key and pressing the power key.

COMBO

The SCSI and serial interfaces are handled by the 85C80 Combo chip as in previous Macintosh models.

Centris 610 & 650, Quadra 800: Accelerated Graphics (7/94)

Revised: 7/28/94
Security: Everyone

Centris 610 & 650, Quadra 800: Accelerated Graphics (7/94)

==========

Article Created: 9 February 1993
Article Reviewed/Updated: 28 July 1994

TOPIC -----

The Macintosh Centris 610, Centris 650, and Quadra 800 are marketed as having "accelerated graphics" support. What is accelerated graphics?

The information in this article relative to the Centris 610 and Centris 650 is also relevant to the Quadra 610 and Quadra 650.

DISCUSSION -----

The Centris 610, Centris 650, and Quadra 800 have a video RAM (VRAM) based, processor direct, accelerated video display architecture. This architecture radically improves the redraw speed of text and graphics on the screen. This architecture is similar to that found on earlier Quadra models. It is called accelerated graphics because of four key architectural features:

- Local bus
- VRAM based
- 68040-specific QuickDraw routines
- Video controller circuitry improvements by using the DJMEMC (Memory Controller)

Local Bus

The entire graphics subsystem is on the 68040 bus located on the logic board. Thus, the memory controller and the video controller can communicate at very high speeds over a 32-bit data path.

VRAM Based

The video sub-system uses separate VRAM for its screen buffer, which is accessed directly by the processor. The VRAM is dedicated to the task of displaying video information and the more VRAM added, the more colors or the larger display

that can be supported.

68040 Specific QuickDraw Routines

The 68040 memory instruction (MOVE16) is used to accelerate certain QuickDraw routines. This causes routines such as vertical scrolling and solid fills to execute up to three times faster. With 1MB of VRAM installed, up to 16 bits per pixel -- or 32,768 colors -- are supported.

Video Controller Circuitry Improvements

The Centris 650 and Quadra 800 utilize 80ns VRAM instead of the 100ns SIMMs used in the Centris 610. The video controller in the Centris 650 and Quadra 800 has been programmed to take advantage of the faster VRAM, which speeds performance up to 20% compared to the Quadra 700.

Article Change History:
28 Jul 1994 - Added reference to Quadra 610 and 650 to aid in searching.

Apple IIe Card: A/ROSE Causing Error Running IIe Startup (1/95)

==========

Article Created: 9 February 1993
Article Reviewed/Updated: 5 January 1995

TOPIC ----------

Some customers launching the IIe Startup application are getting dialog to the effect "This card is defective." They may also be experiencing their IIe software "freezing" either while in use or after sitting idle. This can happen on any Macintosh computer that supports the Apple IIe Card.

This can also happen if you install an Apple Ethernet Card in certain Macintosh computers, and then later remove it and install in its place an Apple IIe Card. You may also encounter occasional crashes after approximately 30 minutes of idle time.

DISCUSSION ----------

To correct this problem, delete the A/Rose and IIe Prefs files then restart. A/Rose is located in the Extensions Folder and IIe Prefs is located in the same folder as the IIe Startup application.

Article Change History:
04 Jan 1995 - Rewrote article to better explain the problem.
12 Oct 1994 - Combined two articles and generalized the information.
07 Dec 1993 - Added Perfoma information.

PowerBook Fax/Data & Express Modem: Third-Party Software (8/93)

==========

Article Created: 29 January 1993
Article Reviewed/Updated: 3 August 1993

TOPIC ----------

Does any third-party fax software support the PowerBook Fax/Data Modem or PowerBook Express Modem?

DISCUSSION ----------

GlobalFax Duo, a new version of the GlobalFax software from Global Village Communication, Inc., is available for customers using Apple's PowerBook Duo systems with Apple Express Modems.

GlobalFax Duo offers capabilities such as the ability to customize address books, send to group addresses and envelope several documents in a single fax transaction.

At this time, no third-party fax software supports the Apple PowerBook Fax/Data Modem.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

Article Change History:
3 August 1993 - Added information about GlobalFax Duo.

DAL: Informix and LIKE Function SQL Queries (2/93)

Revised: 2/4/93
Security: Everyone

DAL: Informix and LIKE Function SQL Queries (2/93)

==========

Article Created: 29 January 1993

TOPIC ----------

I am running DAL on a Sun server, using the Pacer technology. I am trying to query the database, but I'm having difficulty translating the SQL queries for an Informix database into a DAL-compatible SQL query.

The query is:

```
SELECT <whatever> from <table> where acctkey[4,6]="680"
```

For example - check the 3 characters in the acct code from position 4 to 6 and see if they match 680. How would I do this in DAL?

DISCUSSION ----------

The way to do this query in DAL is the same as the DB2 ANSI-standard query using the LIKE function. DAL follows the ANSI-standard, and when there is no standard defined it follows DB2's format.

For this query the LIKE function is the appropriate command. The LIKE function allows you to substitute either:

- An underscore character ("_") for EACH position in which you will accept any character before your desired string

- A single percent sign ("%") for a string of ANY LENGTH that you will accept before and/or after your desired string

In the case of your example (We spaced between the underscore characters to make the point about the number of positions before your desired character string compare):

```
     select <whatever> from <table> where acctkey like '_ _ _ 680%';
```

This means: select when the value of positions 4, 5 & 6 of the account key = 680, and I don't care what follows position 6. In reality the command would look like:

```
     select <whatever> from <table> where acctkey like '___680%';
```

If you wanted to search for "680" in any position the command would be:

```
     select <whatever> from <table> where acctkey like '%680%';
```

DAL will translate this "standard format" query into the appropriate format for the individual DBMS. So this should work for Informix since it supports the positioned query (where acctkey[4,6] ="680").

We don't have access to an Informix database at this time, so we can't verify it against Informix, but we feel confident that the LIKE function will be translated properly. We did test with both Sybase and Rdb and it worked fine.

Be aware that you should put the "%" behind the desired compare string in the LIKE clause unless you are searching for the last positions in the field. If the compare doesn't work for you without the "%", add it and try the SQL statement again.

DAL: Accessing Multiple Oracle SIDs In a Unix Environment (1/93)

Revised: 2/16/93
Security: Everyone

DAL: Accessing Multiple Oracle SIDs In a Unix Environment (1/93)

==========

Article Created: 29 January 1993

TOPIC ----------

I have a site running DAL for SUN OS using Oracle6.

My Question is how can I tell DAL to use another Instance of Oracle? I have tried changing the Oracle SID in the .LOCAL & .CSHRC file for the username without any change. SQLplus recognizes the change in SID, but DAL continues to use the old SID.

DISCUSSION ----------

Check the .PROFILE for the user on the second Oracle to verify that you have the correct paths. This is the file used by interactive processes, which SQLPlus is not. The .PROFILE has to be changed to point to the desired installation of the Oracle SID.

Personal Sharing: File Sharing Can't be Enabled Message (5/95)

Revised: 5/17/95
Security: Everyone

Personal Sharing: File Sharing Can't be Enabled Message (5/95)

==========

Article Created: 1 February 1993
Article Reviewed/Updated: 17 May 1995

TOPIC ----------

I get the message, "File sharing cannot be enabled", even though I have file sharing turned on. What do I have to do to enable personal file sharing?

DISCUSSION ----------

Try these steps in the order presented. If a step fails to restart file sharing, proceed to the next one.

Third-Party File Sharing Software

Find out if TOPS (a third party sharing application) or other file sharing software was previously run on your system. Third-party software that performs this function can modify the System file, disabling System 7 File Sharing. If so, do a clean installation of System Software.

Adequate Volume Space

Look for adequate space on the volumes being shared on your computer. System 7.x creates a few support files for file sharing, and if there is insufficient space on ANY attached disk or partition, file sharing is not enabled. File sharing requires at least 360K of disk space available on each connected disk or partition. More space may be required when there are many Users and Groups. If any volume has less than 360K available, File Sharing reports "File Sharing Cannot Be Enabled."

The only exception to this requirement concerns locked volumes, like CD-ROMs. The information required for sharing a locked volume is stored on the startup disk instead.

Adequate RAM

File sharing requires about 268K of RAM (Random Access Memory) to operate. Applications may not launch, if your Macintosh has less memory than the application requires. Either remove unnecessary extensions to a folder outside the System Folder, or acquire additional RAM for your computer.

Reset Parameter RAM

Zap (reset) the PRAM (Parameter RAM) by pressing the key sequence Command-Option-P-R while starting your System 7.x-equipped computer. This resets the serial ports, so you may need to reactivate AppleTalk on some Macintosh computers.

Conflicting Extensions

Check for conflicting extensions by using the Extensions Manager control panel to turn off all extensions that do not come with system software. Restart, if file sharing now works, find the conflicting extension by turning the extensions on one at a time.

Delete Users & Groups Data File

If you are sharing only the startup volume, and the startup volume is the only volume attached to the computer, try the following steps. However, if you have more than one volume, skip this section.

Step 1
Turn file sharing off using the Sharing Setup control panel.

Step 2
Move (do not delete) the Users & Groups data file, in the Preferences folder, to another folder outside the System folder.

Step 3
Restart the computer.

Step 4
Open the Sharing Setup control panel, and enter a new Owner Name, Owner Password, and Macintosh Name, replacing any previous data. Be sure to use new or different names.

Step 5
Turn File Sharing on.

If this does not resolve the problem, move the Users & Groups data file back into the Preferences folder.

Delete the File Sharing Folder

Step 1
Delete the File Sharing folder from the Preferences folder within the System Folder.

Step 2

Restart the computer.

Step 3
Turn File Sharing on.

Third-Party Formatting Software

If you format any media with a third-party utility, check with the vendor for compatibility with File Sharing and replace the driver if necessary.

Recreate the AppleShare PDS File

You can delete an invisible file called AppleShare PDS on the top level of all connected volumes when sharing. The AppleShare PDS file may need to be deleted on each volume on multiple drive systems, or drives with multiple partitions.

To help troubleshoot in multiple drive situations, start the computer with just the startup volume on. If file sharing works in this configuration, add another drive to the chain and test file sharing each time until you find the drive that prevents file sharing from starting. You can then concentrate on the drive that fails and remove its PDS file.

IMPORTANT: Deleting the PDS file removes all access privileges assigned to folders. You need to reassign access privileges to the folders.

Step 1
Delete the PDS file with ResEdit or a third-party utility that lets you view invisible files. Use the utility to unlock the file and make it visible on the desktop so you can drag it to the Trash.

If you do not have a utility, try to replace the Owner Name and Macintosh Name in the Sharing Setup control panel with different text. You can change them back to their original values later. When you start File Sharing, the system creates a new AppleShare PDS file on the startup volume.

Step 2
Restart the computer.

Step 3
Turn File Sharing on. New AppleShare PDS files are created.

Re-install Software

Before reformatting the hard disk, try re-installing the system software or File-Sharing software and restart the computer.

Reformat

Back up the data and reformat the media. A bad block may be causing the problem.

IMPORTANT: Be sure to back up your data before reformatting. The formatting process erases all data from the volume.

This article is one of many available through the Apple Fax center. For a complete list of available Fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature). The Apple Fax center is available free of charge 24 hours a day, 7 days a week.

Article Change History:
17 May 1995 - Added conflicting extensions solution.
23 Mar 1995 - Made additional minor updates.
17 Mar 1995 - Made minor corrections.

Macintosh System Software 6.0.8: Description (Discontinued)

Revised: 6/2/94
Security: Everyone

Macintosh System Software 6.0.8: Description (Discontinued)

==========

Article Created: 1 February 1993

TOPIC ----------

This article describes Macintosh system software version 6.0.8.

DISCUSSION ----------

System software version 6.0.8 includes printer drivers that are also compatible with System 7. This makes it possible for Macintosh computers running System 6 to share printers on a network with computers running System 7. Be sure to install the drivers with the Installer to ensure the Print Monitor will work. Please note that you can't install 6.0.8 with a network install.

The System 7 TrueType extension is fully compatible with version 6.0.8. Version 6.0.8 is also compatible with LaserWriter Driver versions 6.0.2 and 7.1.1.

System 6.0.8 shipped with Finder 6.1.8, LaserWriter/LaserWriter Prep 7.0, and MultiFinder 6.0.8.

Version 6.0.8 was tested with the Apple IIe Card v2.0, and SNA•ps 1.1 Gateway.

You can use 6.0.8 on the following Macintosh computers:

- Macintosh Plus
- Macintosh Classic
- Macintosh SE
- Macintosh SE/30
- Macintosh II
- Macintosh LC
- Macintosh LC II

- Macintosh IIx
- Macintosh IIsi
- Macintosh IIcx
- Macintosh IIci
- Macintosh IIfx
- Macintosh Portable

68040 and 68LC040: Description (2/93)

Revised: 2/5/93
Security: Everyone

68040 and 68LC040: Description (2/93)

==========

Article Created: 9 February 1993

TOPIC ----------

This article describes the Motorola 68040 and 68LC040 microprocessor.

DISCUSSION ----------

Overview

As the fourth member of Motorola's 68000 processor family, the 68040 can deliver 35 MIPS (million instructions per second) when running at 40 megahertz. The 68040 is a fast, highly-integrated, 32-bit microprocessor that combines RISC-like integer performance with floating-point unit power beyond that of a standard processor. The 68040 provides many of the benefits of the fastest RISC microprocessors while also providing the software compatibility that complex instruction set computing (CISC) microprocessors are known for.

Benchmark test results show that the 68040 can meet or exceed the performance of 486-class microprocessors running at higher clock speeds.

The 68040 is a smooth continuation of the 68000 family, with many new features that contribute to its increased processing power:

- An integer unit
- A floating-point unit (FPU)
- Built-in instruction and data caches (4KB each)
- Two memory-management units (MMUs)
- A bus interface unit

Each unit is highly intelligent and can function independently of the others, giving the 68040 an unprecedented degree of parallelism. The main internal units work at twice the clock speed of the bus interface unit. For instance, when processing most instructions internally, a 68040 clocked at

33 MHz effectively runs at 66 MHz. A cost-reduced version of the 68040, called the 68LC040, has the power of a regular 68040 but without the integrated FPU.

In summary, the 68040's powerful instruction set allows excellent compatibility with existing applications while providing unmatched performance in graphics and CPU intensive applications.

Pipelining for Greater Throughput

One important way to speed up computing is to design processors that use a common RISC technique called pipelining, which overlaps the processing of several instructions in different stages of execution. For example, the 486-class processor can work on as many as four instructions at a time. The 68040 goes further, handling six instructions simultaneously because of the six-stage pipeline in its integer unit. As confirmed in independent research, this difference translates into superior real-world performance when compared with the 486-class chip.

Integrated Caches for Faster Memory Access

Because a processor can move at top speed only if it has a steady supply of program instructions and data from memory, most high-performance systems feature cache memories. Caches are intermediate memories, composed of fast static RAM, and are situated between the processor and the main memory. The 68040 has two separate 4KB caches right on the chip, giving the execution unit rapid access to the information it needs. Having two caches means the 68040 can fetch both data and instructions simultaneously. More than 90 percent of the time, the processor can find the information it needs in the caches. The data cache supports both a writethrough model and a copyback model. Copyback allows the 68040 to hold modified data in the cache until the line needs to be replaced, at which time the data is written to memory. In addition, the 68040 bus interface unit supports a unique "burst mode," which can refill an entire cache line (128 bits) in just five clock cycles, significantly faster than the leading competitive technology.

Shadow Branching for Pre-loading New Instructions

Computers do not usually step through their instructions consecutively. About 75 percent of the time they must skip or branch to another location in their program, and in such cases the processing pipeline must be cleared and loaded with a new sequence of instructions. The 68040 has specialized circuitry that begins filling up with new instructions in advance of the program branch. If the branch is taken, the processor has a head start on the new instruction stream and minimizes the penalty of reloading.

Graphics Support for Faster Screen Re-draw

Parts of the 68040 instruction set are especially valuable for graphics-intensive applications such as multimedia, and for advanced graphical user interfaces. Graphics processing requires the rapid manipulation of large arrays of data bits representing the thousands of pixels (picture elements) on the computer screen. The ability to quickly

handle individual bits, as opposed to bytes and larger data structures, is a must. The 68040, therefore, provides a number of special bit-manipulation instructions. These instructions are lacking on most other microprocessors.

68040 and 68LC040 Microprocessor: Specifications (2/93)

Revised: 2/5/93
Security: Everyone

68040 and 68LC040 Microprocessor: Specifications (2/93)

==========

Article Created: 9 February 1993

TOPIC ----------

This article provides technical specifications of the 68040 and 68LC040 microprocessor.

DISCUSSION ----------

Performance

68040
- 22 MIPS and 3.5 MFLOPS at 25 MHz
- 29 MIPS and 4.6 MFLOPS at 33 MHz
- 35 MIPS and 5.6 MFLOPS at 40 MHz
- 1.3 clock cycles per instruction

68LC040
- 17.6 MIPS at 20 MHz
- 22 MIPS at 25 MHz
- 29 MIPS at 33 MHz
- 1.3 clock cycles per instruction

Manufacturing Technology

- 0.65 µm HCMOS
- 1.2 million transistors

System Components

- 4KB instruction cache
- 4KB data cache
- Instruction memory management unit

- Data memory management unit
- 6-stage pipeline integer unit
- 32-bit data bus
- Floating-point unit (except 68LC040)

Centris 610 & 650: Optional Ethernet (3/94)

Revised: 3/31/94
Security: Everyone

Centris 610 & 650: Optional Ethernet (3/94)

==========

Article Created: 9 February 1993
Article Reviewed/Updated: 31 March 1994

TOPIC -----

The Macintosh Centris 610 and 650 computers have optional Ethernet. What does this mean?

DISCUSSION -----

Apple offers models of the Centris 610 and 650 both with and without Ethernet. The "Ethernet Optional" models include additional components on the logic board which allows those users who need Ethernet to get a fully-integrated solution, without giving up an expansion slot.

Those who choose not to buy an Ethernet configuration can add it later by installing an Apple Ethernet NB Card. Logic boards cannot be upgraded to the "Ethernet Optional" version.

Note: The Macintosh Centris 610 also requires the Macintosh Centris 610 NuBus Adapter Card.

The "Ethernet Optional" models of the Macintosh Centris 610 and 650 use the AAUI connector, which is flexible enough to allow you to choose the right connector for your network. This connection is achieved via an Ethernet media adapter, which is available in Thick (AUI), Thin (coax), and Twisted pair (10BaseT).

Please refer to the Apple Suggested Retail Price List for the listing of Centris configurations with and without the "Optional Ethernet".

Article Change History:
31 March 1994 - Removed need to review at product intro.
07/12/93 - Revised to clarify Ethernet expansion.

Macintosh IIsi, Centris 610 & 660AV: NuBus Adapters (6/95)

Revised: 6/5/95
Security: Everyone

Macintosh IIsi, Centris 610 & 660AV: NuBus Adapters (6/95)

==========

Article Created: 9 February 1993
Article Reviewed/Updated: 5 June 1995

TOPIC ----------

Can you use the same NuBus adapter for the Macintosh IIsi, Centris 610 and Centris 660AV?

DISCUSSION ----------

No, each Macintosh model listed above has its own NuBus adapter card that fits into the Expansion Slot. The part numbers are:

- M0481LL/A: Macintosh IIsi NuBus Adapter Card
- M1402LL/A: Macintosh Centris 610 NuBus Adapter Card
- M9049LL/A: Macintosh Centris 660AV NuBus Adapter Card (discontinued)

Article Change History:
05 Jun 1995 - Revised to show discontinued card.
29 Jul 1993 - Revised and retitled to include the Centris 660AV.

Quadra 610, 660AV: Require 7-Inch NuBus Cards (12/93)

Revised: 7/18/94
Security: Everyone

Quadra 610, 660AV: Require 7-Inch NuBus Cards (12/93)

==========

Article Created: 9 February 1993
Article Reviewed/Updated: 6 December 1993

TOPIC ----------

The following explains the 7-inch NuBus requirement for the Macintosh Centris 610, 660AV and the Quadra 610 and 660AV.

DISCUSSION ----------

While the NuBus standard does include a specification for a 7-inch NuBus card, many currently available NuBus cards do not work. Apple has worked with third parties to make sure that developers are aware of the specification and will be designing cards that fit. A variety of third-party video and networking cards do work. In addition, Apple's Ethernet NB card meets with 7-inch standard.

When using a NuBus card with the Quadra 610, 660AV or Centris 610, 660AV, make sure it consumes no more than 10 watts of power.

Article Change History:
06 Dec 1993 - Added the Quadra and Centris 660AV & reclassified.
02 Nov 1993 - Added Quadra 610
16 Nov 1993 - Deleted Quadra 605 (has no NuBus slot)

Centris 610: Description (Discontinued 10/93)

Revised: 1/26/94
Security: Everyone

Centris 610: Description (Discontinued 10/93)

==========

Article Created: 10 February 1993
Article Revised/Updated: 26 January 1994

TOPIC ----------

This article describes the Macintosh Centris 610 computer system, which was replaced by the Quadra 610 computer in October, 1993.

DISCUSSION ----------

Overview

The Macintosh Centris 610 is up to two times as fast as the Macintosh IIvx and IIci. It can handle sophisticated graphics and multimedia applications as well as mainstream business programs. And the Macintosh Centris 610 supports up to 68MB of RAM, so you can work with multiple applications simultaneously.

For your convenience, the Centris 610 provides built-in support for all Apple displays. Almost any commonly available display -- monochrome or color, portrait or landscape, 12-inch or 21-inch, RGB or VGA -- works with the Macintosh Centris 610. What's more, the Macintosh Centris 610 is equipped with 512K of on-board video RAM (expandable to 1,024K), so you get more colors than ever from your display without having to purchase an additional video card.

The Macintosh Centris 610 gives you flexibility and choice: you can choose an internal hard disk with storage capacity from 80- to 230MB, opt for on-board Ethernet networking, add an internal CD-ROM drive, install a NuBus or processor-direct card, and even connect two displays. A high-speed SCSI interface lets you add additional peripherals, such as scanners or high-volume storage devices. And AppleTalk networking is built in.

This computer's form factor is designed for horizontal use only.

The Macintosh Centris 610 comes with System Software 7.1 and the System

Enabler 040.

Power and Speed

- 20-MHz 68040 microprocessor
- 32-bit data bus
- Up to two times as fast as the Macintosh IIvx and IIci

Memory

- 4MB of RAM, expandable to 68MB

Display

- Works with all Apple displays
- 256 colors, expandable to 32,768 colors

Expansion

- Eight built-in ports for peripheral devices
- Slot for additional expansion card (for use with PDS or 7-inch NuBus card and requires adaptor)
- Optional on-board Ethernet
- Optional internal CD-ROM drive (such as AppleCD 300i)

System software

- System 7 with multitasking, file sharing, QuickTime, Balloon Help, TrueType, and more

Networking

- Built-in AppleTalk networking
- File sharing without a dedicated server

Compatibility

- Reads Macintosh, MS-DOS, OS/2, and ProDOS floppy disk formats

ORDERING INFORMATION

- M1345LL/A Macintosh Centris 610 4MB Hard Disk 80 CPU (without Ethernet)
- M1392LL/A Macintosh Centris 610 4MB Hard Disk 80 CPU
- M1397LL/A Macintosh Centris 610 8MB (1MB VRAM) Hard Disk 230 CPU
- M1398LL/A Macintosh Centris 610 8MB (1MB VRAM) Hard Disk 230 CPU w/CD-ROM

- M1402LL/A Macintosh Centris 610 NuBus Adaptor

Article Change History:
26 January 1994 - Added discontinued information to title & article
11 February 93 - Revised to include all configurations in the "Ordering Information" section.

Centris 610: Specifications-Discontinued (8/94)

Revised: 8/31/94
Security: Everyone

Centris 610: Specifications-Discontinued (8/94)

==========

Article Created: 9 February 1993
Article Reviewed/Updated: 31 August 1994

TOPIC ----------

This article provides technical specifications for the Macintosh Centris 610 computer.

DISCUSSION ----------

Microprocessor

- MC68LC040, 20-MHz clock speed, main logic board clock 20 MHz; 32-bit data bus; no floating point unit (FPU)
- Integral Paged Memory Management Unit (PMMU) and 8K-cache architecture

Memory

- Comes with 4MB of RAM on the logic board
- Expandable to 68MB of RAM by adding Single Inline Memory Modules (SIMMs) to two 72-pin slots. (Doesn't support 1MB, 2MB, or 64MB 72-pin SIMMs.)
- Includes RAM disk software

ROM

- 1MB

Disk Drives

- One built-in Apple SuperDrive 1.4MB floppy disk drive
- One internal 80MB, 230MB, or 500MB hard disk (500MB configuration not available in the U.S.)
- Accommodates one 5.25-inch half-height device, such as the AppleCD 300i internal CD-ROM drive

Video Display

- Supports all Apple displays
- Works with a wide range of third-party displays, including some 19-in., VGA, SVGA, NTSC, and PAL monitors

Video RAM (VRAM)

512K Standard Supports:

- 32,768 colors on the Macintosh 12-inch RGB Display
- 256 colors on the AppleColor High-Resolution RGB Display (13"), Macintosh Color Display (14"), and Macintosh 16-inch Color Display
- 256 shades of gray on the Macintosh 12-inch Monochrome Display
- 16 shades of gray on the Macintosh Portrait Display (15")
- 16 colors on the Macintosh 21-inch Color Display

1,024K Option Supports:

- 32,768 colors on the Macintosh 12-inch RGB Display, AppleColor High-Resolution RGB Display (13"), Macintosh Color Display (14"), and Macintosh 16-inch Color Display
- 256 shades of gray on the Macintosh 12-inch Monochrome Display and Macintosh Portrait Display (15")
- 256 colors on the Macintosh 21-inch Color Display

Interfaces

- Internal expansion slot for one processor-direct or 7-inch NuBus expansion card (requires adaptor)
- SCSI interface for connecting up to six external peripheral devices
- AAUI-15 Ethernet connector (optional)
- Two serial (RS-232/RS-422) ports
- One video port for color and monochrome displays of various sizes and resolutions
- One sound-output port (stereo) for external amplifier or headphones, and CD playthrough
- One sound-input port for monaural sound input
- Two Apple Desktop Bus (ADB) ports for a keyboard, mouse, and other devices

Sound Generator

- Custom integrated circuit that drives a stereo miniature headphone jack (22 kHz sample rate)

Keyboard and Mouse

- Several ADB keyboards with numeric keypads available
- Apple Desktop Bus Mouse II

Clock/Calendar

- Custom integrated circuit with long-life lithium battery

Disability Access

CloseView, Easy Access, and visible-beep software are built in. These and third-party options provide alternative input and output devices

Power Requirements

- Line voltage: 100 to 240 V AC, RMS single phase, automatically configured
- Frequency: 47 to 63 Hz
- Power: 86 W maximum, not including display power

ADB power Requirements

- Maximum current draw for all ADB devices: 500 mA
  (three ADB devices maximum recommended)
- Mouse draws 10 mA
- Keyboard draws 25 to 80 mA (depending on the model used)

Size and Weight

Main Unit:

- Height: 3.4 in. (8.5 cm)
- Width: 16.3 in. (41.5 cm)
- Depth: 15.6 in. (39.7 cm)
- Weight: 14.0 lbs (6.4 kg) Weight varies depending internal devices installed.

Mouse:

- Height: 1.3 in. (3.3 cm)
- Width: 2.4 in. (6.2 cm)
- Depth: 4.2 in. (10.7 cm)
- Weight: 4.0 oz. (0.10 kg)

Operating Environment

- Operating temperature: 50 to 104° F (10 to 40° C)
- Storage temperature: –40 to 116.6° F (–40 to 47 °C)
- Relative humidity: 5% to 95% noncondensing
- Maximum altitude: 10,000 ft. (3,048 m)

Article Change History:
31 Aug 1994 - Corrected processor to be 68LC040.
11 Aug 1993 - 500MB drive is not available in the U.S.

Centris 610, 650 & 660AV: Differences (7/95)

Revised: 7/20/95
Security: Everyone

Centris 610, 650 & 660AV: Differences (7/95)

==========

Article Created: 9 February 1993
Article Reviewed/Updated: 19 July 1995

TOPIC ----------

What are the major differences between the Macintosh Centris 610, the Centris 650 and the Centris 660AV?

The information in this article relative to the Centris 610 and Centris 650 is also relevant to the Quadra 610 and Quadra 650.

DISCUSSION ----------

The major differences between the Centris models are:

Feature:	Centris 610:	Centris 650:	Centris 660AV:
Processor	MC68040 @20 MHz	MC68040 @25 MHz	MC68040 @25 MHz
DRAM Expansion	4 MB to 68 MB	4 MB to 132 MB	8 MB to 68 MB
DRAM Slots	2 slots	4 slots	2 slots
DRAM Speed	80 ns(nanoseconds)	80 ns	70 ns
DRAM SIMM Sizes#	4,8,16 & 32 MB	4,8,16 & 32 MB	4,8,16 & 32 MB
DRAM SIMM Type	72-pin	72-pin	72-pin
Ethernet	Optional	Optional	Standard
FPU	None	Optional	Standard
ROM Size	1 MB	1 MB	2 MB
Maximum VRAM	1 MB (512K stnd)	1 MB (512K stnd)	1 MB (I MB stnd)
VRAM Slots	1 slot	1 slot	1 slot
VRAM Speed	80 ns(nanoseconds)	80 ns	80 ns
NuBus Slots	1!	3	1*
PDS Slot%	Yes	Yes	Yes

Notes:
Composite SIMMs are not supported.
! With optional Centris 610 NuBus Adapter Card installed.
* With optional Centris 660AV NuBus Adapter Card installed.

% On the Centris 610 and 660AV models, the PDS Slot is the Expansion Slot - it can either be used as PDS slot or as a NuBus slot with the appropriate NuBus Adapter Card installed.

The Macintosh Centris 610 and 660AV share the same type of enclosure (form factor) which is a flat, rectangular "pizza" box. The Macintosh Centris 650 uses a Macintosh IIvx style desktop box.

Additionally, the Macintosh Centris 660AV boasts a number of additional features not found in the Centris 610 & 650 including:

- An on-board DSP (Digital Signal Processor) Chip
- GeoPort Communications Architecture
- Composite and S-Video input and output ports
- Sound input and output ports

For further information on the Macintosh Centris 660AV specifications, please consult the Tech Info Library article: "Macintosh Centris 660AV: Specifications"

Article Change History:
19 Jul 1995 - Corrected memory speed info for Quadra 610 and 650.
28 Jul 1994 - Added reference to Quadra 610 and 650 to aid in searching.
29 Jul 1993 - Article revised and retitled to include the Centris 660AV.

Centris 650: Description (8/93) (Discontinued)

==========

Article Created: 9 February 1993
Article Reviewed/Updated: 11 August 1993

TOPIC ----------

This article describes the Macintosh Centris 650.

DISCUSSION ----------

Overview

Designed for performance and flexibility, the Apple Macintosh Centris 650 is the most expandable Macintosh Centris computer. Like all Macintosh Centris models, the Macintosh Centris 650 is ideal for mainstream business and professional users. The Centris 650 offers the speed and power you need to get the job done in the most demanding environments, and the flexibility to grow as your needs change.

Based on the fast 25-megahertz Motorola 68040 microprocessor, the Macintosh Centris 650 provides affordable high performance. The Centris 650 comes with 4MB of RAM soldered to the main logic board, and a built-in 8K cache for speed up to 2.5 times that of the Macintosh IIci and IIvx. (Configurations that include Ethernet or AppleCD 300i have 8MB soldered to the main logic board.) For increased performance, you can expand memory up to 132MB. All configurations except the 4MB configuration include an FPU (an FPU upgrade for the 4MB configuration is not available due to the lack of a socket for a separate Math Coprocessor on the 68LC040 CPU).

For performance and convenience, the Macintosh Centris 650 works with all Apple displays. The standard Macintosh Centris 650 can display 256 crisp colors on the Macintosh 16-inch display. For photographic-quality images, a video upgrade lets you show 32,768 colors on the same display.

You can use the Macintosh Centris 650's expandablity to set up a system that meets your exact needs, or to increase your computing power as your needs grow. Customize your system by adding NuBus expansion cards in the

three expansion slots provided, or with an on-board networking capability add an Ethernet option. The Macintosh Centris 650 comes standard with an internal hard drive, and its high-speed SCSI interface lets you add additional high-volume storage devices, such as the AppleCD 300i internal CD-ROM drive, so you can run CD-ROM applications in brilliant color.

This computer's form factor is designed for horizontal use only.

The Macintosh Centris 650 comes with System Software 7.1 and the System Enabler 040.

Power and Speed

- 25-MHz 68040 processor
- 32-bit data bus

Memory

- 4MB of RAM (8MB with Ethernet or AppleCD 300i), expandable to 132MB

Display

- Works with all Apple displays
- 256 colors, expandable to 32,768 colors

Expansion

- Optional internal CD-ROM drive (such as AppleCD 300i)
- Eight built-in ports for peripherals
- Three NuBus expansion slots
- One inline 68040 processor-direct slot
- Optional on-board Ethernet

System software

- System 7 with multitasking, file sharing, QuickTime, Balloon Help, TrueType, and more

Networking

- Built-in AppleTalk networking
- File sharing without a dedicated server

Compatibility

- Reads Macintosh, MS-DOS, OS/2, and ProDOS floppy disk formats

Centris 650: Specifications (Discontinued 10/93)

==========

Article Created: 9 February 1993

TOPIC ----------

This article provides technical specifications for the Macintosh Centris 650 computer.

DISCUSSION ----------

Microprocessor

- MC68040, running at 25-MHz clock speed, main logic board clock 25 MHz; 32-bit data bus
- Optional, integrated 25-MHz math coprocessor (FPU). All configurations except the 4MB configuration include an FPU.
- Integral Paged Memory Management Unit (PMMU), and 8K-cache architecture

Memory

- Comes with 4MB of RAM on the logic board (8MB with Ethernet or AppleCD 300i)
- Expandable to 132MB of RAM by adding SIMMs to four 72-pin slots. (Doesn't support 1MB, 2MB, or 64MB 72-pin SIMMs.)
- Includes RAM disk software

ROM

- 1MB

Disk Drives

- One built-in Apple SuperDrive 1.4MB floppy disk drive
- One internal 80MB, 230MB, or 500MB hard disk
- Accommodates one 5.25-in., half-height device, such as the AppleCD 300i internal CD-ROM drive

Video Display

- Supports all Apple displays
- Works with a wide range of third-party displays including some 19-in., VGA, SVGA, NTSC, and PAL monitors

Video RAM (VRAM)

512K standard supports:

- 32,768 colors on the Macintosh 12-inch RGB Display
- 256 colors on the AppleColor High-Resolution RGB Display (13"), Macintosh Color Display (14"), and Macintosh 16-inch Color Display
- 256 shades of gray on the Macintosh 12-inch Monochrome Display
- 16 shades of gray on the Macintosh Portrait Display (15")
- 16 colors on the Macintosh 21-inch Color Display

1,024K option supports:

- 32,768 colors on the Macintosh 12-inch RGB Display, AppleColor High-Resolution RGB Display (13"), Macintosh Color Display (14"), and Macintosh 16-inch Color Display
- 256 shades of gray on the Macintosh 12-inch Monochrome Display and Macintosh Portrait Display (15")
- 256 colors on the Macintosh 21-inch Color Display

Interfaces

- Three internal NuBus expansion slots
- One 68040 processor-direct slot
- SCSI interface for connecting up to six external devices
- AAUI-15 Ethernet connector (optional)
- Two serial (RS-232/RS-422) ports
- One video port for color and monochrome displays of various sizes and resolutions
- One sound-output port for stereo playback from CDs and stereo playback of Macintosh sound
- One monaural sound-input port
- Two Apple Desktop Bus (ADB) ports for a keyboard, mouse, and other devices

Sound generator

- Custom integrated circuit that drives a stereo miniature headphone jack (22 kHz sample rate)

Keyboard and mouse

- Works with several ADB keyboards
- Apple Desktop Bus Mouse II

Clock/Calendar

- Custom integrated circuit with long-life lithium battery

Disability Access

• CloseView, Easy Access, and visible-beep soft-ware are built in. These and third-party options provide alternative input and output devices.

Power Requirements

• Line voltage: 100 to 240 V AC, RMS, automatically configured
• Frequency: 50 to 60 Hz
• Power: 112 W maximum, not including display power

ADB power requirements

• Maximum current draw for all ADB devices: 500 mA (three ADB devices maximum recommended)
• Mouse draws 10 mA
• Keyboard draws 25 to 80 mA, depending on the model used

Size and weight

Main unit:
• Height: 6.0 in. (15.2 cm)
• Width: 13.0 in. (33.0 cm)
• Depth: 16.5 in. (41.9 cm)
• Weight: 25 lb. (11.3 kg) Varies depending on internal devices installed.

Mouse:
• Height: 1.3 in. (3.3 cm)
• Width: 2.4 in. (6.2 cm)
• Depth: 4.2 in. (10.7 cm)
• Weight: 4.0 oz. (0.10 kg)

Operating environment

• Operating temperature: 50 to 104° F (10 to 40° C)
• Storage temperature: –40 to 116.6° F (–40 to 47° C)
• Relative humidity: 5% to 95% noncondensing
• Maximum altitude: 10,000 ft. (3,048 m)

Article Change History:

03/02/93 - Revised to mention 8MB RAM with Ethernet or AppleCD 300i, clarify FPU situation.
03/09/93 - Revised to add a note that it doesn't support 1MB, 2MB, or 64MB 72-pin SIMMs.

Centris 610 and 650: Floating-Point Unit Upgrades (7/94)

==========

Article Created: 9 February 1993
Article Reviewed/Updated: 28 July 1994

TOPIC ----------

Neither the Macintosh Centris 610 nor the Centris 650 4/80 configuration come with an FPU. Can I upgrade these Centris models with an FPU? Are there any compatibility problems if my Centris doesn't have an FPU?

Some configurations of the Quadra 650 have an FPU standard, those that do not can be upgraded as per below. The Quadra 610 is the same as the Centris 610.

DISCUSSION ----------

FPU Upgrades

You can upgrade the Macintosh Centris 610 or 650 with an FPU, but Apple doesn't provide or support such an upgrade. You must rely on third-party companies who can remove the 68LC040 from its socket and replace it with a 68RC040. Since Apple doesn't intend to offer an upgrade, we can't guarantee that the processor will remain a socketed component.

Compatibility without an FPU

There aren't very many compatibility problems with non-FPU systems. While the addition of an FPU allows certain types of applications to execute faster, these applications tend to be more technical in nature. Business applications -- such as spreadsheets, databases and word processors -- don't require an FPU to run.

Most applications check to see if there's an FPU present. If one doesn't exist, they emulate the floating point instructions in software. There are a few applications that expect or require an FPU. These applications will present problems and we anticipate most software developers will revise these products.

Article Change History:
28 Jul 1994 - Added Quadra 610 to aid in searching.

12 Aug 1993 - Clarified which model configurations do not have an FPU.

Security: Everyone

Centris 650: Difference from Macintosh IIvx (2/93)

==========

Article Created: 9 February 1993

TOPIC ----------

What is the difference between the Macintosh IIvx and the Macintosh Centris 650?

DISCUSSION ----------

The Macintosh Centris 650 offers over two and a half times the performance of the Macintosh IIvx, the ability to add any Apple display, double the maximum DRAM expansion, and optional on-board Ethernet.

Security: Everyone

Centris 610 & 650, Quadra 800: Logic Board Design (7/94)

==========

Article Created: 9 February 1993
Article Reviewed/Updated: 28 July 1994

TOPIC

This article describes the Macintosh Centris 610, Macintosh Centris 650, and Macintosh Quadra 800 logic board.

The information in this article relative to the Centris 610 and Centris 650 is also relevant to the Quadra 610 and Quadra 650.

DISCUSSION

The logic board used in the Centris 650 and Quadra 800 are physically the same size as the Quadra 700 motherboard, but contains fewer components.

The Centris 610 logic board is a new design that supports a smaller footprint.

The architecture includes two internal buses: the system bus, and the I/O bus, plus the NuBus.

The system bus is connected directly and runs at the same clock rate as the 68040. This high-performance bus attaches directly to the DJMEMC memory/frame buffer controller for maximum performance.

The I/O bus is partially buffered from the system bus and is synchronous to the system bus. The data portion of the I/O bus is 16 bits wide, and includes features such as byte-steering and dynamic bus sizing, which are necessary to maximize compatibility with software and I/O devices also used on the MC68030.

The NuBus allows industry-standard third-party boards to be easily attached.

Macintosh: Installer Error Codes 2231 and 2232 (2/93)

Revised: 2/4/93
Security: Everyone

Macintosh: Installer Error Codes 2231 and 2232 (2/93)

==========

Article Created: 1 February 1993

TOPIC ----------

On a Macintosh IIci with 33.7MB of free hard disk space, I did a custom installation of:

  PATHWORKS Programmer
  MacTerminal for System 7
  MacTerminal Manual
  MacX

Not long after the installation begins determining which files will be needed, it shows a 'Stop' dialog box saying:

  There's a problem with the Disk "Ten Forward". No installation can take place. (Error #2231).

Using the Installer's numbers, the total disk requirements of my selections is about 11MB, so a disk space problem is unlikely.

What is error number 2231?

DISCUSSION ----------

A catchall error alert occurs during an indeterminate phase of the installation which the Installer cannot sort out. The two common error numbers are 2231 and 2232.

• Error 2231 indicates that some resource file could not be found.

• Error 2232 indicates that a specific resource could not be found.

Both errors have been found to occur as a result of incompatible startup

documents or INITs. The Installer makes frequent checks of ResError and may encounter a spurious error set by some background process which gets interpreted as an unresolved Installer failure.

The error has been found to occur with INITs that patch GetNextEvent in order to process specific system events. If this alert occurs, users should restart their system with the shift key held down under System 7.0, or to manually remove any suspect INITs or other startup documents under System 6.0.x and earlier.

ARA: Tolerance of Ring Delay (2/93)

==========

Article Created: 2 February 1993

TOPIC ----------

I have edited my AppleTalk Remote Access (ARA) modem script to answer after nine rings. This is on my office machine, sharing the voice line during the day. I want to be able to answer voice calls during the day and leave answer calls enabled all the time.

When I go home at night and try to connect, AppleTalk Remote Access tells me that the other modem is not responding: for example, it doesn't answer in the expected period of time.

Is there something I can do to fix this, like:

- Reduce the ring count in my modem script
- Use ResEdit to change the appropriate value in the application to allow for the long delay needed with nine rings

What is the maximum value that can be set for ATSx, where x is answer after x rings, that Remote Access can tolerate?

DISCUSSION ----------

You will also need to increase the value of register S7, which determines the modem's time delay -- in seconds -- to wait for carrier after dialing. S7 needs to be set to a value greater than the length of time it takes for the modem to dial and listen to nine rings. Setting S7=100, within the modem script, should do the trick.

Disk First Aid 7.1: Run Before Installing System Software

Revised: 2/4/93
Security: Everyone

Disk First Aid 7.1: Run Before Installing System Software

==========

Article Created: 4 February 1993

TOPIC ----------

I'm concerned about a letter that appeared in the 1/11/93 MacWeek about the possibility of losing files if I upgrade from 7.0 to 7.1 without first going through the Tune Up and Disk First Aid procedures. Is it indeed a problem?

DISCUSSION ----------

This is an issue that has been twisted somewhat. All of this stems from the original disappearing files and folders problem found under System 7.0. This problem is prevented by System 7 TuneUp 1.1.1 and also System 7.1. However, if your Macintosh has already run into this problem, but you aren't yet aware of it, installing the Tune Up or System 7.1 won't remove the existing problem.

This means that you might lose data because your directory has become corrupted, not because you installed 7.1 (or Tune Up). Therefore, we recommend that every System 7.1 (or System 7.0) user run Disk First Aid 7.1 to ensure that their directory hasn't become corrupted. Once you've done this, then System 7.1 or Tune Up 1.1.1 will prevent that particular problem from happening again.

You don't need to install Tune Up before installing 7.1, but you do need to take the Disk First Aid step.

As a final note, if you've already installed 7.1, you can still run Disk First Aid 7.1 to verify that you don't have this problem. The reason for running Disk First Aid prior to an install of System 7.1 is to prevent installing more files on a previously corrupted directory.

Apple Basic Color Monitor: Description (Discontinued)

Revised: 6/20/94
Security: Everyone

Apple Basic Color Monitor: Description (Discontinued)

==========

Article Created: 1 February 1993
Article Reviewed/Updated: 5 May 1994

TOPIC ----------

This article describes the Apple Basic Color Monitor.

DISCUSSION ----------

With .39-millimeter dot pitch and 640- by 480-pixel resolution, the Basic Color Monitor gives you the image quality you need for text documents and graphic images. A built-in, tilt-and-swivel base makes it simple to position the display to the angle you find most comfortable. The brightness, contrast, and on/off controls are conveniently located on the front panel.

The Basic Color Monitor is compatible with the Macintosh LC line, the Macintosh Centris line, the Macintosh Quadra line, and many Macintosh PowerBook computers. It attaches directly to your computer's monitor port with the provided adapter (part number 922-1104). And the Basic Color Display meets low-frequency ELF and VLF requirements for magnetic and electric emissions.

The Apple Basic Color Monitor is the most economical member of the Macintosh half-page display family, which also includes the Macintosh Color Display, a 14-inch monitor. The flat, high-contrast screen of the Macintosh Color Display eliminates distortions and delivers clear resolution over the entire area of the screen -- even in your most finely detailed drawings.

In short, the Basic Color Monitor is a good choice for Macintosh users who want the impact and appeal of a color monitor at the most affordable price. And for even brighter color and exceptional resolution, the Macintosh Color Display is an outstanding alternative.

Features

Display quality
• 14-inch screen, 640 horizontal by 480 vertical pixels

- .39 mm dot pitch
- Tilt-and-swivel base for adjustment to comfortable viewing angle
- 60-Hz refresh rate
- Meets strict SWEDAC MPR-2 requirements for low-frequency (ELF and VLF) magnetic and electric emissions
- Plug-and-play with any Macintosh LC, Macintosh Centris, Macintosh Quadra, or Macintosh PowerBook computer
- Easy access to brightness, contrast, and on/off controls

Order Number

Apple Basic Color Monitor: Technical Specs (Discontinued 10/93)

==========

Article Created: 1 February 1993
Article Reviewed/Updated: 27 October 1993

TOPIC ----------

This article gives the technical specifications for the Basic Color Monitor. These specifications are for the VGA monitor sold in the U.S.

DISCUSSION ----------

Order Number

• M9103LL/A

Picture Tube

• Shadow Mask
• 14-inch diagonal, 13-inch viewable CRT
• 0.29 mm dot pitch

Input Signals

• Video: RGB all positive analogue
• Sync: 31.5 KHz horizontal frequency, - horizontal sync.
  60 Hz vertical frequency, - vertical sync.

Video

• Resolution: 640 horizontal by 480 vertical pixels
• Active display area: Adjusted at the factory to produce an active video area described by an ideal rectangle of 9.3 x 6.9 inches (235 x 176 mm).

Controls

• Brightness

- Contrast
- Power on/off

Physical Measurements

- Weight: 25.3 lbs (11.5 Kg)
- Height: 12.9 inches (32.8 cm)
- Width: 14.5 inches (36.8 cm)
- Depth: 15.2 inches (38.5 cm)

Power Supply

- Input voltage: AC 100-125V
- Input frequency: 50-60Hz
- Input current: 1.2A max. (at 120VAC)
- Consumption: 70W

Environmental Requirements

- Operating ambient temperature: 5° C to 35° C
- Humidity: 10% to 80% (non-condensing)
- Altitude: to 7,000 feet
- Storage temperature: -40° C to 65° C

Safety

- Meets strict SWEDAC MPR-2 requirements for low-frequency (ELF and VLF) magnetic and electric emissions.

System Requirements

- Compatible with all Macintosh LC, Macintosh Centris, Macintosh Quadra, and many Macintosh PowerBook computers

Signal Connector

- 15-pin D shell connector

Pin	Function
1	Red signal
2	Green signal
3	Blue signal
4	Jumper to pin 10
5	Self test
6	Red return
7	Green return
8	Blue return
9	No pin
10	Digital ground
11	Jumper to pin 10

Color Classic: After Removing Logic Board, Reset Clock (2/93)

==========

Article Created: 9 February 1993

TOPIC --------------------

Why does my Color Classic ask me to reset the clock after I've removed -- and replaced -- the main logic board?

DISCUSSION --------------------

The system clock is part of the main logic board. When the logic board is removed, it's disconnected from all power, which resets the system clock.

The main system ASIC (custom integrated circuit) keeps track of whether the logic board has been disconnected, and when it's reconnected system software is reminded to ask you to reset the clock to the appropriate time.

Color Classic: Description (2/93) (Discontinued)

==========

Article Created: 9 February 1993

TOPIC ----------

This article describes the Macintosh Color Classic computer system.

DISCUSSION ----------

Overview

The Macintosh Color Classic has the power and color of a Macintosh LC, with the compact Classic form factor. It's designed for customers who need a compact Macintosh with more power, expandability, and RAM expansion than previously available -- and who want color.

The Color Classic features the Motorola 68030 microprocessor running at 16 megahertz, with an optional 16 MHz 68882 Floating Point Unit. DRAM is expandable from 4 megabytes to 10 megabytes.

The color display is a 10-inch Trinitron tube. Support for 256 colors is built-in and is expandable to thousands of colors. It has one processor-direct slot, compatible with the PDS slot in the Macintosh LC. The modified Classic form offers ergonomic enhancements and easy access to the logic board for memory upgrade and system expansion.

Better/Easier Expansion

Customers can easily add memory and expansion cards. A user-accessible door on the rear panel allows easy removal of the logic board. The logic board slides in and out and features a single, card-edge connector for all internal connections.

NOTE: Some expansion cards designed for the Macintosh LC may not fit within the space constraints of the Macintosh Color Classic. Check with the card's

manufacturer before you buy.

Higher Performance

The 16-MHz 68030 processor is directly attached to all other subsystems to minimize latency times and increase performance.

Color Graphics

The internal monitor is controlled by 256K of video RAM, which provides up to 8 bits-per-pixel. VRAM is upgradable to 512K, giving users more than 32,000 colors on the 10-inch monitor.

Power-saving Features

The Color Classic is the first Classic-style computer to feature a new power-saving cycle, similar to the Sleep mode in a PowerBook. This shuts down the screen and the hard disk drive, reducing power by about 50% when the computer has been idle for a user-definable period. Any key press or mouse move reactivates the full-power mode.

Soft and Hard Power Switches

Like the Macintosh II series, the Macintosh Color Classic allows users to turn the computer on, and shut it down, using the keyboard power key. While the power rocker switch on the rear of the computer is in the on position, the power key on the keyboard is active.

Easy-access Push Button Controls

Pushbuttons on the front panel of the Color Classic let the user adjust audio volume, and video brightness/contrast. The volume button activates a beep sound at the appropriate level, and the brightness and contrast are combined in a single up/down button.

Color Classic: Energy-Saving Features (2/93)

Revised: 2/11/93
Security: Everyone

Color Classic: Energy-Saving Features (2/93)

==========

Article Created: 9 February 1993

TOPIC ----------

Why is the Macintosh Color Classic being called an "energy-saving computer? I've left my computer on overnight, and nothing special happens.

DISCUSSION ----------

The Color Classic has a special power-saver feature that automatically turns off the display and disk drive when the computer has been idle for a certain interval (the user specifies what that interval is). Then, if the user moves the mouse or presses a key on the keyboard, the display and disk drive come to life again.

Because the screen takes several seconds to re-power, a system beep sounds to let the user know the system is ON and is coming out of the power-saver mode.

To turn on the energy-saving feature:

1) Open the Screen control panel.

2) Turn the feature on, and choose the time interval.

In its active state, the Color Classic uses 58 watts. When powered down using the Power Saver feature, the computer uses just under 25 watts.

Color Classic: Expanding RAM Beyond 4MB (2/93)

Revised: 2/4/93
Security: Everyone

Color Classic: Expanding RAM Beyond 4MB (2/93)

==========

Article Created: 9 February 1993

TOPIC ----------

This article provides details on expanding the RAM in a Macintosh Color Classic beyond the 4MB that's soldered on its main logic board.

DISCUSSION ----------

- You install DRAM in the Dual SIMM slot.
- Although you can physically install up to 12MB memory, the Color Classic can address only 10MB.
- The Color Classic requires 30-pin DRAM SIMMs with speed of 100ns or faster. Slower SIMMs, such as 120ns, do not work in the Color Classic.
- You can install two DRAM SIMMs, but they must both have the same amount of memory (both 1MB SIMMs, or both 4MB SIMMs, for example).
- Macintosh 2MB Memory Expansion Kit (two 1MB SIMMs) is order number M0219.
- The DRAM SIMMs in the Macintosh 4MB Expansion Kit (M5952LL/A) also work in the Color Classic. The 4MB kit contains four 1MB SIMMs, so it may not be appropriate for individual buyers because the Color Classic can accept only two SIMMs.

Color Classic: Built-in Microphone (2/93)

Revised: 2/4/93
Security: Everyone

Color Classic: Built-in Microphone (2/93)

==========

Article Created: 9 February 1993

TOPIC ----------

1) What can I record with the Macintosh Color Classic's integrated microphone?

2) I have a microphone from another Macintosh computer and it doesn't fit into the Macintosh Color Classic's sound input jack on the back of the computer. Why is that?

DISCUSSION ----------

1) Using third-party software, you can record just about anything. Without additional software, you can record system beeps. Use the Sound Control Panel. Detailed instructions are in your Getting Started Manual.

2) The Color Classic's integrated microphone is the same quality as the external one we previously packaged with other Macintosh computers.

   We expect that customers will want to use an external microphone (instead of the integrated microphone) only if they need an exceptionally high quality microphone, which is likely to be one with with a four-pin connector. Thus, the sound input jack on the back of the Color Classic requires a microphone with a four-pin connector. The microphones that Apple ships with other Macintosh models don't have four-pin connectors.

   The sound port can physically accommodate a microphone with a 3-pin connector, but the computer won't recognize it as a microphone. Instead, the Color Classic assumes that anything with a 3-pin connector is a standard line-in (from a stereo, for example).

Color Classic: How To Get More than 256 Colors (2/93)

Revised: 3/31/93
Security: Everyone

Color Classic: How To Get More than 256 Colors (2/93)

==========

Article Created: 9 February 1993

Article Change History

03/31/93 - UPDATED
- To clarify that adding a 512K VRAM SIMM is ineffective and unsupported.

TOPIC ----------

How do I get more than 256 colors for my Color Classic?

DISCUSSION ----------

You need to expand your computer's VRAM: install one 256K VRAM SIMM in the open VRAM slot (VRAM kit order number M1310LL/A contains one 256K VRAM SIMM).

The Macintosh Color Classic requires standard VRAM SIMMs. The VRAM Expansion Kit (M5953LL/A) also works in the Color Classic. This kit contains two 256K VRAM SIMMs, but the Color Classic needs only one of them.

The built-in screen will reach maximum bit depth with a 256K VRAM SIMM. Even though a 512K VRAM SIMM will fit on the Color Classic Logic Board, that configuration is unsupported.

After expanding the VRAM, use the Monitors control panel to select "thousands of colors".

Color Classic, LC 520: Power Switches (8/93)

==========

Article Created: 9 February 1993
Article Reviewed/Updated: 2 August 1993

TOPIC ----------

1) I just pulled my new Color Classic out of the box, plugged it in, and turned it on. But it didn't come to life. Why?

2) Can I shut off the dialog box that comes up once I hit the Power key on the keyboard?

DISCUSSION ----------

1) When the Color Classic and the LC 520 first come out of the box and the power switch on the rear is turned on, the computer doesn't start up. To turn on the computer, just press the power key on the keyboard. Most power-on and -off operations should be done from the keyboard.

   You need to use the power switch in the back of the Color Classic and the LC 520 only to prepare them for:

   • Long-term storage

   • Removal of the logic board. (If you forget to turn this switch off before removing the logic board, there is a danger of shorting something out, because power will still be active on the board.)

   To shut down the Color Classic or the LC 520, press the power key on the keyboard.

2) No. For data security reasons, we thought it was best that the dialog appear each time the keyboard button is pressed. You can't disable it.

Article Change History:
2 August 1993 - Updated with references to LC 520 as well.

Color Classic: Specifications (3/93) (Discontinued)

==========

Article Created: 9 February 1993

Article Change History

03/12/93 - REVISED
- To clarify the on-board RAM configuration.

TOPIC

This article provides the specifications for the Macintosh Color Classic computer system.

DISCUSSION

Microprocessor

- Motorola 68030, clock speed 16 MHz, 16-bit data bus
- Integral PMMU (Paged Memory Management Unit)
- Socket for optional math coprocessor: 16 MHz floating point unit (FPU)
  The Macintosh Math Co-processor kit is order number M6775LL/A

Memory

- 4MB of RAM on the logic board and two memory expansion slots for SIMMs
- RAM expansion to as much as 10MB
- RAM disk software included

Storage

- One built-in Apple SuperDrive 1.4MB floppy-disk drive that reads, writes, and formats Macintosh, MS-DOS, OS/2, and ProDOS disks
- One built-in 80MB SCSI hard-disk drive (Other capacities may be offered in the future.)

• Optional external AppleCD CD-ROM drive

Display

• Built-in 10-inch (diagonal) color Trinitron CRT
• 512 x 384 pixels (12% more viewing area than Classic and Classic II)
• 76 dpi, .26-stripe pitch
• 256 colors, upgradeable to thousands of colors (see VRAM)

VRAM (Video RAM)

• 256K allows 256 colors
• 512K allows 32,768 colors

Interfaces

• AppleTalk built-in
• Internal expansion slot for one Macintosh-LC PDS (processor-direct slot) card
• SCSI interface for up to six external SCSI peripheral devices
• Two serial (RS-232/RS-422) ports
• Two ADB (Apple Desktop Bus) ports for mouse, keyboard, and so on

Sound

Monophonic 8-bit digital-analog conversion, with 22-kHz sample rate -- capable of driving stereo headphones or other stereo equipment through the sound jack.
• Built-in omnidirectional electret microphone
• One mono sound-out port for external audio amplifier or headphones
• One sound-in port for 8-bit mono sound, sampled at 22 or 11 kHz

Keyboard and Mouse

• Apple ADB Mouse II
• ADB Keyboard with numeric keypad and two-level tilt adjustment

Clock and Calendar

• Custom integrated circuit with long-life lithium battery

Fan

• 9-12 cubic feet/min. axial; operational flow
• Negative pressure cooling

Disability Access

• CloseView, Easy Access, and visible beep built in
• Third parties provide alternative input/output devices

Power Requirements

- Line voltage: 90 to 240 VAC, RMS single phase automatically configured
- Frequency: 47 to 63 Hz
- Power: 100 W maximum

ADB Power Requirements

- Mouse draws 10 mA
- Keyboard draws 25 mA
- Maximum current draw for all ADB devices: 500 mA
  (maximum of three ADB devices recommended)

Size and Weight

	Main Unit	Mouse	Keyboard
Height	14.5 in. (37.0 cm)	1.3 in. (3.3 cm)	1.3 in. (3.25 cm)
Width	9.9 in. (25.2 cm)	2.4 in. (6.17 cm)	16.0 in. (40.53 cm)
Depth	12.6 in. (32.15 cm)	4.2 in. (10.73 cm)	5.9 in. (15.06 cm)
Weight	22.5 - 23.2 lb. (10.2 - 10.5 kg)	4.0 oz. (0.10 kg)	1.96 lb. (0.89 kg)

Environment

- Meets SWEDAC MPR-2 requirements for low emissions
- Built-in energy-saving feature
- Operating temperature: 50 to 104° F (10 to 40° C)
- Storage temperature: -40 to 116.6° F (-40 to 47° C)
- Relative humidity: 20% to 95% noncondensing
- Altitude: 15,000 feet (4,722 m) maximum

Macintosh Classic Series: Tilt/Swivel, Security Device (2/93)

Revised: 2/4/93
Security: Everyone

Macintosh Classic Series: Tilt/Swivel, Security Device (2/93)

==========

Article Created: 9 February 1993

TOPIC ----------

I'd like to tilt my Color Classic so I can see the display better. Can I do that? And is there a product that lets me secure my computer to a table?

DISCUSSION ----------

A company called Kensington Ltd. sells a Tilt/Swivel stand that works with the Macintosh Classic, Classic II, and Color Classic. Kensington also has a security kit that works with those models.

To locate a vendor's address and phone numbers, use the vendor's name as a search string.

Color Classic: Using It While Travelling (2/93)

Revised: 2/4/93
Security: Everyone

Color Classic: Using It While Travelling (2/93)

==========

Article Created: 9 February 1993

TOPIC --------------------

I want to travel with my North American Macintosh Color Classic. Can I use it in other countries?

Is there a problem if I take it to the southern hemisphere?

DISCUSSION --------------------

The Macintosh Color Classic has a universal power supply, which means you can use it outside the U.S. However, you'll different power cords, which are available where you're traveling.

Your computer's display has been optimized for the northern hemisphere. If you take it to the southern hemisphere, your display will not be adjusted properly. Take it to an authorized service provider for adjustment.

Color Classic: No Upgrade from Classic or Classic II (2/93)

Revised: 2/4/93
Security: Everyone

Color Classic: No Upgrade from Classic or Classic II (2/93)

==========

Article Created: 9 February 1993

TOPIC ----------

I have a Macintosh Classic. Can I upgrade it to a Macintosh Color Classic?

DISCUSSION ----------

No. The Color Classic's new color display and expansion slot would not fit into the case of a Macintosh Classic or Classic II. Even if the components would fit, such an upgrade would involve replacing virtually every component of your Classic computer, and wouldn't be cost-effective.

Color Classic: Apple IIe, Macintosh LC, & Ethernet Cards (2/93)

Revised: 2/4/93
Security: Everyone

Color Classic: Apple IIe, Macintosh LC, & Ethernet Cards (2/93)

==========

Article Created: 9 February 1993

TOPIC ----------

1) Is the Color Classic compatible with software and hardware designed for the Macintosh LC?

2) Can my Macintosh Color Classic run Apple IIe software?

3) Can I add Ethernet networking to my Color Classic?

DISCUSSION ----------

1) Yes, the Macintosh Color Classic is fully compatible with the Macintosh LC line.

2) Yes, if Apple's Apple IIe Card is installed in the expansion slot inside the Color Classic, you can run Apple IIe software. The Apple IIe Card for Macintosh LC (v2.2) is order number M0444LL/C; it works in the Color Classic as well as in the Macintosh LC.

3) Yes, you can install Apple's Ethernet card in the expansion slot. The Apple Ethernet LC Card is order number M0443LL/B. You need a transceiver in addition to the Ethernet card itself.

Macintosh: Why Some Models Have Two Keyboard Ports (2/93)

Revised: 2/3/93
Security: Everyone

Macintosh: Why Some Models Have Two Keyboard Ports (2/93)

==========

Article Created: 9 February 1993

TOPIC --------------------

Why does my Macintosh have two, rather than just one, socket for the keyboard cable?

DISCUSSION --------------------

Some Macintosh models have two ADB (Apple Desktop Bus) ports, so you can either:

- Plug the keyboard and the mouse directly into the computer, or
- Plug the mouse into the keyboard and then the keyboard into the computer. (You can plug the keyboard into either port.)

PowerBook 160, 165c, 180, 180c: Power Button Improvements (6/93)

Revised: 5/16/94
Security: Everyone

PowerBook 160, 165c, 180, 180c: Power Button Improvements (6/93)

==========

Article Created: 9 February 1993

TOPIC ----------

The function of the power button (the power button on the back of the unit) has been changed on the PowerBook 160, 165c, 180, and 180c, compared to earlier PowerBook models.

DISCUSSION ----------

Earlier Models

A PowerBook 140, 145, or 170 powers down if the button is pressed while the system is on. This sometimes causes users to lose data that had not been saved.

Improvements

On the PowerBook 160, 165c, 180, and 180c, pressing the power button is like selecting Shut Down from the Finder's Special menu: before applications quit, they ask the user whether to save unsaved files in memory before powering down.

If the power button is held in for more than 5 seconds, the system powers down without saving data. This allows users to shut down the system if the system is frozen.

PowerBook 165c: Significance of Its Name (2/93)

Revised: 5/16/94
Security: Everyone

PowerBook 165c: Significance of Its Name (2/93)

==========

Article Created: 9 February 1993

TOPIC ----------

Does the name 165c have any particular significance?

DISCUSSION ----------

Just as the name PowerBook 145 suggests a performance improvement compared to the PowerBook 140, the name PowerBook 165 suggests a performance improvement compared to the PowerBook 160.

The letter c denotes color.

Revised: 6/30/94
Security: Everyone

PowerBook 165c: Description (6/94)

==========

Article Created: 9 February 1993
Article Reviewed/Updated: 30 June 1994

TOPIC ----------

This article describes the PowerBook 165c, the first color PowerBook.

DISCUSSION ----------

Overview

The PowerBook 165c has PowerBook 180 power, with a bright, vivid color display. It features the Motorola 68030 microprocessor running at 33 megahertz, and includes the 68882 floating point unit.

The built-in FSTN/passive matrix LCD gives an 8-bit (256 color) resolution at 640 x 400 pixels. Video-out comes standard and supports most Macintosh monitors, including the Portrait and 16-inch RGB monitors.

The PowerBook 165c also supports many VGA and SVGA monitors (with the proper adapter cable).

The standard pseudostatic RAM configuration is 4MB, expandable to 14MB.

Hard drive options include 80MB and 120MB capacities.

The PowerBook 165c has one processor-direct slot, and features a connector for an internal modem.

PowerBook 165c offers greater performance than the PowerBook 160. Upon introduction, the PowerBook 165c will be added to the existing PowerBook line -- between the PowerBook 160 and the PowerBook 180.

Full, Truer Color with New Color LCD Display

Unlike competitive passive-matrix display products that offer 16 dithered colors, the PowerBook 165c provides a full 256-color display. It also supports 256 colors/grays to most Apple monitors -- including the 16-inch RGB Display -- as well as providing VGA and SVGA output.

A new screen technology, including a brightness enhancement filter and twin backlight tubes, provides a brighter display with less washout and cursor "submarining" than before. The new screen also offers a wider viewing angle, wide enough for three adults to sit side by side and still see all of the screen.

QuickTime and ColorSync Support

The PowerBook 165c supports QuickDraw, ColorSync, and QuickTime. You can create presentations with full color, and QuickTime movies, as on other color Macintosh computers. (Because of the nature of the passive-matrix display, QuickTime movies are displayed at their best on an external monitor.)

PowerBook 180 Performance

The PowerBook 165c features the same 68030 processor, running at 33 MHz, as the PowerBook 180. It also features the 68882 floating point co-processor.

New Battery and Power Adapter

The PowerBook 165c has a new 2.9 amp-hour NiCad battery that provides 1.5 to 2 hours of continuous battery use from a full charge. It has the same charging characteristics as the battery in the PowerBook 160 and 180, taking from 3 to 4 hours to charge to 80%, and an additional 3 to 4 hours to fully charge.

The power supply for the PowerBook 165c provides 24 watts of power, compared to the 17-watt supply used in the PowerBook 160 and PowerBook 180.

What's in the Box

Inside the accessory kit:

- Hardware Components
- Printed Documentation
- System software installed on hard drive

PowerBook 165c Display: Technical Details (2/93)

==========

Article Created: 9 February 1993

TOPIC ----------

This article provides technical details about the new color display in the Macintosh PowerBook 165c.

DISCUSSION ----------

Overview

Apple has worked hard to provide the best quality color passive-matrix display in the industry. The PowerBook 165c uses a passive-matrix 256-color flat panel display (FPD) with good color saturation, high contrast, and a quick response time. Ghosting and shimmering, which are often found on passive-matrix displays, has been reduced on the PowerBook 165c screen.

To make the best passive-matrix display required a number of changes over the existing PowerBook displays. We now have two Cold Cathode Fluorescent Lamps (CCFL), to increase the brightness of the screen for the color display, mounted at the top and bottom of the screen. Because of the addition of color pigment and higher quality polarizers on the display glass, additional light is needed to create a bright, vivid display. This display will distinguish the PowerBook 165c from the passive-matrix competition in a side-by-side comparison. The displays used on other passive-matrix color systems support only 16 colors, but the PowerBook 165c can support 256 different colors on the screen.

Some other color displays suffer from washout: that is, uneven brightness and color across the screen. To reduce washout, the PowerBook 165c display uses a new type of liquid crystal material. The reflector and light pipe on the back of the screen have been optimized to provide even light distribution across the entire display. This means that colors will appear more vivid and true.

The sharper contrast or color quality and the increased viewing angle are

improved over the competition, thanks to a new polarizer that increases the contrast ratio.

PowerBook Display and Dimming

When the backlight is off, the screen turns black. The additional filter and color pigments used in the display don't allow enough light to enter the display for the user to see the image on the screen without the backlight. This is different from the grayscale displays on the PowerBook 160 and 180, which still allow the user to read the display with the backlight off. This is a problem because the machine will look like it is in sleep state and the user may accidentally turn the unit off or just close the lid and carry it away (draining the battery in the process).

Liquid Crystal Displays

Liquid crystal displays are nonemissive, in that they do not create their own light, but pass or block light. The display in the PowerBook 165c uses a backlight to send the image to the user. The display consists of a reflector, light pipe, rear polarizer, back glass, liquid crystal material, front glass, and front polarizer.

The liquid crystal material is a liquid with rod-shaped molecules inside. These modules can form a twisting helix (staircase) pattern that "bends" light entering the display. The two polarizers are shifted and will only allow light that is bent by the liquid crystal material to be seen by the user. When a current is applied, the rods straighten out and no longer bend the light.

Each pixel in a color display contains three subpixels: one for red, one for green, and one for blue. A red, green, and blue color pigment is applied to the glass at each subpixel of the display. These color pigments line up with the electrodes that run down the glass and the liquid crystal material inside the display. The display can twist each subpixel up to 64 times per cycle. This controls the amount of red, green, and blue that is seen by the user. The display controller twists the blue and green liquid crystals 64 times, and the red liquid crystal 0 times, to get the brightest red possible. To get a darker red, it starts to twist the red liquid crystal.

Passive Matrix

In a passive-matrix display, the top glass contains very fine thin wires, or electrodes, that are aligned vertically down the screen. The bottom glass contains wires that cross the display horizontally. When a current is passed from the top glass electrode to the bottom glass electrode, the liquid crystal rod stops twisting. Because the light is not bent, the polarizer stops the user from seeing the light passed from the back of the display. Because all the pixels in a given row or column use the same wire, you can have crosstalk on the display. If a large number of pixels in a row are on (as in a menu bar), the other pixels in that row may twist. This is seen as a slight line that passes across the screen. Crosstalk has been reduced on the PowerBook 165c display and should be less of a problem compared to the PowerBook 160 display.

Active Matrix

An active-matrix display has a transistor at each pixel to activate the liquid crystal material. The top or bottom layer of glass contains the transistors, and wires that provide individual control over each subpixel. This individual control over each pixel allows the display to provide higher contrast, larger viewing angle, faster response, and a brighter display. The problem with this type of display is its production cost. The screen is like a 9-inch memory chip with 768,000 transistors. If any of the wires leading to the transistor are bad, or the transistor etched into the glass fails, the pixel does not work. This causes a large number of displays to be rejected because too many pixels do not work -- and this increases the cost of this type of display.

Macintosh Duo Dock with 230MB Hard Drive, FPU, VRAM (1/96)

Revised: 1/3/96
Security: Everyone

Macintosh Duo Dock with 230MB Hard Drive, FPU, VRAM (1/96)

==========

Article Created: 9 February 1993
Article Reviewed/Updated: 3 January 1996

TOPIC ----------

This article describes a new configuration of the Macintosh Duo Dock, with 230MB hard drive, FPU, and VRAM.

DISCUSSION ----------

This new product adds a richly configured new docking system for PowerBook Duo System users.

The new configuration includes an internal 230MB hard disk drive, a math coprocessor, and an additional 512K of VRAM (for a total of 1MB). The 1MB total VRAM will support up to 32,000 colors (16-bit color) on up to a 16-inch monitor.

The new Duo Dock configuration also includes a file reconciliation software package: PowerMerge from Leader Technologies. File reconciliation software, such as PowerMerge, allows a user to reconcile files between the PowerBook Duo notebook and the hard drive in the Duo Dock or on another Macintosh system.

In addition, the software supplied includes a pre-configured file that backs up the contents of the PowerBook Duo hard drive to a folder on the Duo Dock hard drive. When installed, the software will automatically update this backup set every time the PowerBook Duo returns to the docking station. Other uses of the software include automatic updating of files on the notebook with files on network servers, so for example a salesperson could always be sure of having the latest price list and current version of a sales presentation.

PowerMerge software is a product of, and is supported by, Leader Technologies. To locate a vendor's address and phone numbers, use the vendor's name as a search string.

PowerBook 165c: No Upgrade from Monochrome Models (2/93)

Revised: 5/31/94
Security: Everyone

PowerBook 165c: No Upgrade from Monochrome Models (2/93)

==========

Article Created: 9 February 1993

TOPIC ----------

Can I upgrade to a PowerBook 165c from earlier PowerBook models?

DISCUSSION ----------

There will not be an upgrade to the PowerBook 165c. There were changes to all major components in the system. The addition of the cousin card, new battery, new power adapter, new inverter, display, display housing, interconnect card, and plastics make such an upgrade too complex and costly.

PowerBook 165c: Battery and Power Adapter (5/94)

Revised: 5/6/94
Security: Everyone

PowerBook 165c: Battery and Power Adapter (5/94)

==========

Article Created: 9 February 1993
Article Reviewed/Updated: 6 May 1994

TOPIC ----------

This article describes the PowerBook 165c's battery and power adapter.

DISCUSSION ----------

The PowerBook 165c has a 2.9 AHr NiCad battery, which provides 1.5 to 2 hours of battery use from a full charge. The battery has the same charging characteristics as the existing PowerBook computers, taking about 3 to 4 hours to charge the battery to 80%, and 3 or 4 more hours for a full charge.

Here's a comparison of the PowerBook 165c batteries with those in other PowerBook models:

	PowerBook 140/145/170	PowerBook 145B	PowerBook 165c
Battery Capacity	2.5 AHr	2.8 AHr	2.9 AHr
Battery Life	2 to 3 hours	2 to 3 hours	1.5 to 2 hours

Because of the additional power demands of the color display, the PowerBook 165c's power adapter has been increased to 24 watts from the 19 watt supply used with the PowerBook 160 and 180. Older power adapters will work with the PowerBook 165c -- but charging time will be increased. Use of the older adapter with this system may drain the battery, even though it's plugged in. The power adapter resembles the existing power adapter, but has "24W" embossed on the plug end for identification purposes. The new adapter can be used on existing systems, and with the battery charger, without any problems.

PowerBook 165c: RAM Expansion (2/93)

Revised: 5/31/94
Security: Everyone

PowerBook 165c: RAM Expansion (2/93)

==========

Article Created: 9 February 1993

TOPIC ----------

The PowerBook 165c can be expanded to 14MB of RAM. This article provides details.

DISCUSSION ----------

The PowerBook 165c can be expanded to 14MB of RAM. There is 4MB of memory on the logic board, and one memory slot. The slot is similar to the PowerBook 100, 140, 145, and 170 memory connector -- but uses an unused pin to determine the speed of the RAM chips installed. If existing RAM cards (100ns) are used, an extra wait state will be included when the system accesses that memory.

The PowerBook 165c runs faster if 85ns chips are used. The M4664 4MB card should be used with the PowerBook 165c. The slower 100ns card (M1033) will be phased out when inventory is exhausted.

PowerBook 165c RAM Speed and Wait States:
• 85ns (recommended) with two wait states
• 100ns with three wait states

Third-party memory cards designed for the PowerBook 160 and PowerBook 180 may not fit the PowerBook 165c.

PowerBook 165c: Specifications (7/95)

Revised: 7/20/95
Security: Everyone

PowerBook 165c: Specifications (7/95)

==========

Article Created: 9 February 1993
Article Reviewed/Updated: 20 July 1995

TOPIC ----------

This article provides the specifications for the Macintosh PowerBook 165c computer system.

DISCUSSION ----------

Microprocessor

- Motorola 68030, clock speed 33 MHz
- 68882 math coprocessor, 33 MHz

System Software

- Requires System 7.1 or later
- PowerBook control panel for setting battery conservation options
- PowerBook Display control panel for activating video mirroring and display dimming
- AutoRemounter control panel lets system sleep when connected remote file servers
- A System Enabler specifically for the PowerBook 165c

Memory and Storage

- 4MB pseudostatic RAM, expandable to 14MB maximum
- RAM contents preserved in sleep mode; RAM is lost at shutdown
- One built-in Apple SuperDrive 1.4MB floppy-disk drive that reads, writes, and formats Macintosh, MS-DOS, OS/2, and ProDOS disks
- One built-in 80MB or 120MB SCSI hard-disk drive

Display

- 9-inch (22.6 cm) diagonal backlit passive-matrix liquid-crystal

- Built-in support for 256 colors from a palette of 4,096 colors
- Two video-out modes:
  - Video mirroring for simultaneous display of the same image on two screens
  - Dual display for full use of both screens
- External Display Options:
  - Macintosh 12-inch Monochrome Display
  - Macintosh 12-inch RGB Display
  - AppleColor High-Resolution RGB Display
  - Macintosh Color Display (14")
  - Macintosh 16-inch Color Display
  - Macintosh Portrait Display (15")
  - Some VGA and SVGA displays

Interfaces

- One power adapter port
- One HDI-30 SCSI port for external SCSI peripheral devices
- Two RS-422 serial ports, one of which is disabled if internal modem is installed
- One ADB (Apple Desktop Bus) port for mouse, keyboard, and so on
- One slot for optional modem
- One video-out port supporting 8-bit density and 256 colors
- Security slot for use with third-party anti-theft and related products

Modems

- Optional internal PowerBook Express Modem:
  - 14,400 bps (bits per second) data
  - fax send and receive at 9600 baud
  - Includes Express Fax software
- Optional internal 2400-bps modem:
  - fax send at 9600 baud
  - Includes Fax send software

Sound

- Apple Sound Chip provides 8-bit sound -- capable of driving stereo headphones or other stereo equipment through the sound port
- Built-in omnidirectional microphone: output voltage 4 mV, peak-to-peak, at normal volume
- One stereo sound-out port for external audio amplifier
- One mono sound-in port, 8-bit sound sampled at 11 or 22 kHz

Keyboard and Trackball

- 63 keys (U.S.) or 64 keys (ISO), standard Macintosh layout, 3.0 mm travel
- Two-level tilt adjustment
- Software indicates Caps Lock on screen
- Built-in 30mm trackball: the two buttons are electrically connected

Clock and Calendar

• CMOS custom chip with long-life lithium battery

Disability Access

• CloseView, Easy Access, and visible beep built in
• Third parties provide alternative input/output devices

Power

• 2.9 AHr NiCad battery (1.5 to 2 hours of battery life)
• Line voltage: 100 to 240 volts (Note: an early product specification sheet for this model erroneously states that its line voltage is 110 to 120 V.)
• Frequency: 50 to 60 Hz
• Maximum current draw for all ADB devices: 200 mA (maximum of three ADB devices recommended)

Size and Weight

Height	2.29 in. (5.8 cm)
Width	11.25 in. (28.6 cm)
Depth	9.3 in. (23.6 cm)
Weight	7.0 lb. (3.2 kg)

Environment

• Operating temperature: 50 to 104° F (10 to 40° C)
• Storage Temperature: -40 to 65° C (-40 to 148° F)
• Relative humidity: 20% to 80% noncondensing
• Maximum altitude: 15,000 feet (4,722 m)
• Maximum operating altitude: 10,000 feet (3,048 m)

Ordering Information

PowerBook 165c: System Software and Control Panels (2/93)

Revised: 5/31/94
Security: Everyone

PowerBook 165c: System Software and Control Panels (2/93)

==========

Article Created: 9 February 1993

TOPIC ----------

This article describes the System software and special control panels associated with the new Macintosh PowerBook 165c notebook computer.

DISCUSSION ----------

Macintosh System 7.1 is the first world-ready reference release of Macintosh system software. Release 7.1 was designed with the global community in mind.

Support for all scripts (alphabets, or writing systems) has been consolidated into the base system, and the extensions (WorldScript I and II). Localization has been made easier, and adding multiple scripts to the base has been greatly simplified.

- System Enabler # 121 is specifically for the PowerBook 165c.

- A new color Macintosh Basics disk ships with the PowerBook 165c.

New Control Panels

All PowerBook control panels have been modified to support all PowerBook computers.

- The Portable control panel is now called PowerBook.

- There are two new control panels: Auto Remounter and PowerBook Display. Auto Remounter mounts file servers when the system comes out of sleep. PowerBook Display controls screen dimming, and a new feature called mirroring.

PowerBook Control Panel

This control panel has been modified and no longer includes separate controls for system and hard drive sleep. Like the PowerBook 100, the PowerBook 160, 165c, and 180 support SCSI Disk Mode. The SCSI ID number for SCSI Disk Mode is set from this control panel. The Options button allows the user to keep the system awake when plugged in and set the processor speed. The Reduced speed button reduces the clock speed by half, adding 10-15 minutes to battery life.

The Options dialog will be reduced on the PowerBook 160, 165c, and 180 to make sure the user doesn't turn off power cycling (system rest). To get the full dialog, hold down the Option key when clicking the Options button. When power cycling is turned off and a 16" monitor is used with full hard drive access, the system will not be able to charge the battery; to eliminate this problem, the Option key solution was selected to make sure the user would read the manual to understand the consequences of turning off power cycling.

PowerBook Display Control Panel

This control panel allows the user to set the amount of time the unit takes before the backlight and external monitor turn off to save power. The display dims and turns off only after a period of no keyboard or mouse activity. This is one of the most effective ways to increase battery life.

Video Mirroring

The video mirroring feature displays the same image on the internal display and on the external display. Mirroring sets the screen size to 640 by 400. This allows the presenter to look at the PowerBook built-in display and see exactly what is on the external display or projection device. Video mirroring uses QuickDraw to catch the calls to the screen.

Auto Remounter Control Panel

The Auto Remounter control panel reconnects file servers when the system wakes up from sleep or -- if selected -- from shut down. When Auto Remounter is turned on, the user doesn't see the message stating network services will be lost when Sleep is selected.

SCSI Disk Mode

Like the PowerBook 100, the PowerBook 160, 165c, and 180 support SCSI Disk Mode. With the special SCSI Disk adapter, a user can turn the PowerBook's internal drive into an external drive for another Macintosh computer. Use the PowerBook control panel to set the SCSI id number for the PowerBook drive when used in SCSI Disk Mode.

Apple Internet Router: Half-Routing & Configuring a Port (2/93)

Revised: 2/4/93
Security: Everyone

Apple Internet Router: Half-Routing & Configuring a Port (2/93)

==========

Article Created: 3 February 1993

TOPIC ----------

This article describes half-routing and configuring a half-routing port.

DISCUSSION ----------

Half-routing is similar to tunneling in that it involves sending AppleTalk protocols across a non-AppleTalk network. What distinguishes half-routing from tunneling is that half-routing uses modems to establish asynchronous connections between two routers.

Apple Internet Router half-routing uses AppleTalk Remote Access-compatible modem scripts and, like ARA, it uses V.42bis data compression and MNP packetization and error correction. It supports the use of modems at 9600 bps or faster through the Printer or Modem port.

Configuring a Half-Routing Port

Double-clicking the DialUp access method under either the Modem port or the printer port brings up the DialUp Port Info window. You can configure a half-routing port to call, answer, or answer and call back.

LaserWriter Driver 7.2: Upgrade Info for Systems 6 and 7 (9/93)

Revised: 9/20/93
Security: Everyone

LaserWriter Driver 7.2: Upgrade Info for Systems 6 and 7 (9/93)

==========

Article Created: 5 February 1993
Article Reviewed/Updated: 14 September 1993

TOPIC ----------

What's different in LaserWriter driver 7.2 over the previous version, 7.1.2?

Is LaserWriter driver 7.2 compatible with System 6?

Can I use PrintMonitor 7.0 with LaserWriter driver 7.2?

Can I upgrade to LaserWriter driver 7.2 by just replacing the driver, rather than using the Installer?

DISCUSSION ----------

LaserWriter driver 7.2 added support for the LaserWriter Pro series. LaserWriter driver 7.2 also offers a benefit for LaserWriters IIf and IIg. You can turn FinePrint or PhotoGrade off or on from the driver's option window.

A bug with PrintMonitor 7.1 and System 6 was found too late in the LaserWriter Pro series development to correct it before shipping. PrintMonitor's "Set Print Time" option will crash on systems prior to 7.0. PrintMonitor 7.1 was shipped with the LaserWriter Pro series, and will automatically install over the previous version.

LaserWriter driver 7.2 is compatible with PrintMonitor 7.0. However, there's a new version of PrintMonitor 7.1 that's installed when using the installation disks provided with the LaserWriter Pro printers. The Installer checks to see what version of system software (System 6 or System 7) is installed so that it places all the resources in their proper places.

System 7 users can upgrade their systems by dragging the driver to the

System Folder. System 6 users can upgrade by dragging the LaserWriter driver, PrintMonitor, and Backgrounder, to their System Folder. The AppleShare 2.0 Printer server also requires the Laser Prep file. However, we recommend that all users let Installer do the installation.

Article Change History:
14 September 1993 - Added information about when Laser Prep is required.
26 March 1993 - Edited for clarity.

PATHWORKS for Macintosh v1.1a and System Software 7.1 (2/93)

Revised: 2/16/93
Security: Everyone

PATHWORKS for Macintosh v1.1a and System Software 7.1 (2/93)

==========

Article Created: 3 February 1993

TOPIC ----------

This article contains extracts from release notes, and a recent memo, concerning v1.1a of PATHWORKS for Macintosh. DEC has been working with Apple to resolve the problem with UAMs mentioned in these release notes, and is working on the DECnet problem noted.

DISCUSSION ----------

What is PATHWORKS for Macintosh V1.1a?

PATHWORKS for Macintosh V1.1a is a maintenance release that will be distributed to customers who have purchased MDDS for the PATHWORKS for Macintosh client. Distribution to these customers will begin in mid-January.

PATHWORKS for Macintosh V1.1a was developed to specifically support Apple's System 7.1 and includes:

- MacX 1.2
- MacTCP 1.1.1
- Mail for Macintosh V1.1b
- Online release notes

PATHWORKS for Macintosh Client Release Notes

December 1992

Revision/Update Information: This is an extract from a revised manual.

Software Version:

- PATHWORKS for Macintosh Client,Version V1.1a
- Macintosh System Software V7.1

Digital Equipment Corporation
Maynard, Massachusetts

First Published, December 1992

The following are trademarks of Digital Equipment Corporation: DECnet, VAXshare, VMS, and the DIGITAL Logo.

The following are trademarks of Apple Computer, Inc.: Apple, the Apple logo, AppleShare, and Macintosh are registered trademarks of Apple Computer, Inc. MacX is a trademark of Apple Computer, Inc.

Introduction

This PATHWORKS V1.1a kit was developed to support PATHWORKS for Macintosh administrators upgrading to Apple's new System 7.1 Software. Users running System 7.0.1 and earlier do not need to replace the components contained herein.

The following components have been modified to work with System 7.1:

- Mail for Macintosh has been updated to version 1.1b

- MacTCP control panel has been upgraded to version 1.1.1

- AdminTCP control panel has been upgraded to version 1.1.1.

- MacTCP tool has been upgraded to version 1.2

- MacX has been upgraded to version 1.2

Consult the separate Read Me files from Apple Computer, Inc. on "PATHWORKS

for Mac V1.1a 1/3" if you are installing MacX software.

Copying the Upgrade Software to a VAXshare Volume

[deleted]

ATTENTION:

Before upgrading PATHWORKS for Macintosh users to V1.1a software, please be aware of a problem with newer AppleShare Workstation software and UAMs on 68000-based Macintoshes.

The AppleShare Workstation software that ships both with AppleShare 3.0 and 3.0.1 and with System 7.1, crashes when used with the VMS password UAM (or any external UAM) on 68000-based Macintoshes.

The affected models are:

• Mac Plus, SE, Classic, Portable, and PowerBook 100.

NOTE that 68020, 68030, and 68040 based machines have no such restriction, and work properly.

If you upgrade one of these systems running PATHWORKS for Macintosh to run System 7.1, you should remove the VMS UAM file from your AppleShare folder in the System Folder. Removing the VMS UAM avoids crashes when accessing AppleShare volumes.

Similarly, if you install PATHWORKS on a Macintosh running System 7.1, you should choose Customize in the PATHWORKS Installer, and do not install the VMS UAM.

In the case of pre-system 7.1 Macintoshes that are clients of AppleShare 3.0 or 3.0.1, you will have to choose between the AppleShare 3.0 or 3.0.1 workstation software and the VMS UAM. The older AppleShare 2.x client, distributed on the Apple System Software disks, works with AppleShare 3.0 or 3.0.1, but does not enable all of the features.

If you do not have the VMS UAM installed, you are restricted to using the Apple UAM which is built-in to the AppleShare client. Note that this UAM has a limit of 8 characters for a password. If longer passwords are required, then you must not install the AppleShare 3.0 or 3.0.1 workstation software on 68000-based Macintoshes, and do not upgrade them to System 7.1.

The PATHWORKS for Macintosh engineering team is working with Apple Computer, Inc., to remove this restriction in a future release.

How to Upgrade PATHWORKS for Macintosh Users to V1.1a Software

[deleted]

Known Problem with DECnet for Macintosh V1.1

There is a problem with DECnet for Macintosh v1.1 and System 7.1. The icons in the NetCopy scrolling windows appear as little boxes and are indistinguishable as folder, file, and disk icons.

The workaround for this problem is to select the file, choose Get Info from the File Menu (Command-I) which shows whether a file or folder is selected.

MEMO Extract: How to get PATHWORKS for Macintosh 1.1a?

A few weeks ago Digital announced that PATHWORKS for Macintosh V1.1a would ship to currently paid MDDS (Media Documentation Distribution Service) customers ONLY.

Since last Friday, when 1.1a shipped, DEC has received numerous calls from customers who said they would gladly pay a small fee for the update. Therefore, starting immediatly, IF you have a valid DEC access number, and IF you have Pathworks for Macintosh, and IF you are willing to pay $100, you may call the CSC at 800-354-9000 and DEC will sell it to you. This is a deviation from DEC's usual policy on MUPs (Manditory UPdates) and is being done on a trial basis. This is of course only for customers who do not have MDDS service (as those that do will be getting it any day now).

Apple Internet Router: Files Written During Installation (2/93)

Revised: 2/4/93
Security: Everyone

Apple Internet Router: Files Written During Installation (2/93)

==========

Article Created: 3 February 1993

TOPIC ----------

This article describes the files written to the target hard disk during Apple Internet Router (AIR) installation.

DISCUSSION ----------

Apple Internet Router requires System 7, at least 4MB of RAM, and a hard disk. Like most other networking products, it uses the Installer, but it will be distributed on its own installation diskettes, rather than using the Network Software Installer disk.

The Installer writes the following files to the target hard disk:

- The Router file (a document in the Extensions folder)
- The Router Admin 3.0 application
- Three ADEVs: DialUp, LocalTalk (Built-in), and LocalTalk (Modem)
- MNPLink Tool and AppleTalk Remote Access modem scripts
- AppleTalk 58
- A/ROSE
- Network Control Panel
- Responder
- Network resources and Remote Access resources

- SNMP management software, consisting of the LibraryManager file and the associated documents SNMPRouterAgent, SNMPLibrary, SNMPMacAgent, and SNMPAtkTransport, all of which go into the Extensions folder, plus SLM resources.

- TokenTalk 2.5 and/or EtherTalk 2.5, where appropriate. These are necessary to support the hierarchical port setup structure.

Macintosh LC III: Use 72-pin RAM SIMMs (2/93)

Revised: 2/5/93
Security: Everyone

Macintosh LC III: Use 72-pin RAM SIMMs (2/93)

==========

Article Created: 9 February 1993

TOPIC ----------

This article describes the 72-pin PC-style SIMM used in the Macintosh LC III.

DISCUSSION ----------

Unlike the Macintosh LC II, the LC III comes with a single 72-pin PC-style SIMM socket.

Apple chose to implement the single 72-pin RAM SIMM socket because of space considerations on the Macintosh LC III logic board, and the greater availability of these SIMMs. SIMMs used in earlier Macintosh models do not work in the Macintosh LC III.

The Macintosh LC III has been tested with 1MB, 2MB, and 4MB RAM SIMMs. It does notsupport 256K SIMMs.

Possible RAM configurations include 4MB, 5MB, 6MB, 8MB, 12MB, 20MB, and 36MB.

When purchasing SIMMs, be sure you get 72-pin fast-paged mode with 80ns access time or faster.

Apple Internet Router 3.0: Overview and Packaging (2/93)

Revised: 2/4/93
Security: Everyone

Apple Internet Router 3.0: Overview and Packaging (2/93)

==========

Article Created: 3 February 1993

TOPIC ----------

This article gives an introductory overview and packaging information of the Apple Internet Router 3.0.

DISCUSSION ----------

Introduction

The Apple Internet Router is designed to be a cost-effective, scalable workgroup router. Because it doesn't require a dedicated machine, it will run concurrently with other applications or services, such as file servers and mail servers.

Apple has two major reasons for creating the Apple Internet Router:

- To add scalability and flexibility to AppleTalk networks.
- To provide a platform for validating Apple's and third parties' implementations of the AppleTalk Update-Based Routing Protocol (AURP).

Product Overview

Apple Internet Router is an AppleTalk Phase 2 router, so it can coexist on AppleTalk networks with current Phase 2 routers, including AppleTalk Internet Router 2.0. The only protocol additions or changes are those protocols used for private communications between cooperating AURP routers.

Apple Internet Router improves on version 2.0 in several areas. The most significant of these are:

- It's a System 7 compatible application (rather than a desk accessory like

version 2.0). The administrator can start up, shut down, or reconfigure the router without having to restart the Macintosh.

- It supports wide area network connectivity in the forms of tunneling across non-AppleTalk network systems and half-routing between modems.

- It supports internets of up to 65,279 networks (the architectural maximum of AppleTalk).

- It supports SNMP network management.

Packaging

Apple Internet Router consists of three separate products, allowing each customer to pick only those that are appropriate for a particular installation. These products are:

- The Basic Connectivity package, which contains the router application, the half-routing extension, the SNMP Router Agent, and all functionality necessary to support other extensions.

- The AURP-TCP/IP WAN extension, which enables TCP/IP tunneling. This package includes MacTCP and the IPTunnel ADEV. The Basic Connectivity package must also be installed.

- The AURP-X.25 WAN extension, which enables X.25 tunneling. The Basic Connectivity package must also be installed.

There also will be a toolkit for developers, which will contain the AURP specification, API specifications for the router, and various test tools including an AURP simulator.

Macintosh LC III: Using with a VGA Monitor (2/93)

Revised: 2/4/93
Security: Everyone

Macintosh LC III: Using with a VGA Monitor (2/93)

==========

Article Created: 9 February 1993

TOPIC ----------

This article describes how to connect a VGA monitor to a Macintosh LC III.

DISCUSSION ----------

To connect a VGA monitor to the Macintosh LC III video port, a cable with the following configuration is required.

```
Macintosh LC III
DB-15                                          VGA Connector
-------------                                  --------------

  2  ------------------- Red Video ------------  1
  1  ------------------- Red Ground -----------  6
  9  ------------------- Blue Video -----------  3
 13  ------------------- Blue Ground ----------  8
  5  ------------------- Green Video ----------  2
  6  ------------------- Green Ground ---------  7
 15  ------------------- Hsync ---------------- 13
 12  ------------------- Vsync ---------------- 14
 14  ------------------- Sync Ground ---------- 10
 10  ---------------- |
  7  ---------------- |Connect 7 & 10 so the sense pin ID will equal VGA
```

A few issues to remember when connecting VGA monitors to the Macintosh LC III:

- VGA monitors may have variances when purchased from different VGA monitor vendors. Test a particular monitor for compatibility with the Macintosh LC III before buying.

- VGA monitors from different vendors have different image quality specifications. There may be significant differences between Apple-brand monitors and VGA monitors. Look at the monitors side-by-side before buying.

- When a VGA monitor is connected as described above, the resolution is 640 x 480.

- The bit depth supported depends on the amount of VRAM installed. The Macintosh LC III ships with 512K of VRAM in one VRAM SIMM socket and is expandable to 768K.

Apple Internet Router: Router Management (2/93)

Revised: 2/4/93
Security: Everyone

Apple Internet Router: Router Management (2/93)

==========

Article Created: 3 February 1993

TOPIC ----------

This article describes Apple Internet Router management.

DISCUSSION ----------

Startup Options

The "Set Startup..." dialog is accessed from the Control menu. This dialog is available only when the router is not running.

You can choose whether or not to automatically bring up the router when the Macintosh starts up. This would be useful, for example, in a case where the Macintosh running the router is unattended. You can also choose whether or not to cancel starting up the router in case of error.

Apple Internet Router lets you save any number of different configuration documents (unlike AppleTalk Internet Router 2.0, which saved only one, always under the name "Router"). In the Set Startup... dialog, you select one of these saved documents to be the one that is used when the router starts up. Once a startup document is specified, it, rather than the Untitled document, gets opened when the application gets launched.

In large internets, set "Routing Table Entries" to reflect the number of networks on the internet and "Zone table entries" to reflect the number of zones. In each case, you should also allow room for reasonable growth of the network over time.

Security

Apple Internet Router allows the administrator to password-protect access to the Admin application. This option is accessed under the Control menu.

Monitoring

The Network Information window lists routing-table information for each destination network and zone on the internet. This display can be sorted by network range, zone name, distance, or forwarding port, and each display is available in detailed or summary mode, decimal or hexadecimal notation, and ascending or descending order.

The Router Log window displays a list of router activity, with the most recent activity shown at the top of the list.

Statistics

Apple Internet Router allows the administrator to view operating statistics relating to either the router or to particular ports. You can reset all statistics to zero through the Control menu. This menu item is available only when the router is running. All statistics are also initialized when the router is started up.

Router Statistics

Apple Internet Router's Router Statistics window displays a graphical summary of the network activity and error statistics. This is available in two forms: a bar graph, which is used for short intervals (up to 5 minutes), and a line graph, which is used for longer periods (up to 24 hours).

Port Statistics

The Port Statistics window displays various statistics for each configured port, and gives the totals for the router.

AIR: Configuring AppleTalk Port, Device Hiding (2/93)

Revised: 2/4/93
Security: Everyone

AIR: Configuring AppleTalk Port, Device Hiding (2/93)

==========

Article Created: 3 February 1993

TOPIC ----------

This article describes setting up the Apple Internet Router, and LAN support in configuring an AppleTalk port and Device Hiding.

DISCUSSION ----------

The Untitled default document, which you see when you first launch the router's Admin application, displays icons representing the available physical ports.

Double-clicking one of the physical ports or clicking the arrow next to it expands the port to display the available access methods or sub-ports. (A sub-port would be, for example, a card that supports more than one physical port.)

Apple Internet Router supports three "families" of access methods: AppleTalk, half-routing, and tunneling. Each family may include more than one specific access method. For example, LocalTalk, EtherTalk, and TokenTalk are all AppleTalk access methods. In addition to AppleTalk, the serial ports also support half-routing (DialUp), while Ethernet and Token Ring ports also support tunneling (IP Tunnel). Double-clicking an access method brings up the corresponding Port Info window, containing information specific to that access method.

Configuring an AppleTalk Port

Configuring an AppleTalk port is fairly straightforward. First, determine whether the port is to be a seed or nonseed port. A seed port is one that determines and propagates the network number range and zone list for the physical network it is attached to (or, in the case of a LocalTalk network, the network number and zone name). A nonseed port obtains network number

and zone information from a seed router on the same network.

Each AppleTalk network on an internet must have at least one seed router attached to it. It is permissible, even desirable in many cases, to have more than one seed router attached to a network, but they must all agree about that network's number range and zone list.

If the port is a nonseed port, then the only configuration option is to define hidden devices, if any. If the port is a seed port, then the administrator specifies the network number range and zone list. You can use "Get Zones..." to select zone names from the Macintosh's current AppleTalk connection. The administrator must take care that the network number and zone specifications agree with any other seed routers on the same network.

Device Hiding

One of the more interesting features of Apple Internet Router is device hiding, which lets you select any device or devices on your local network to be hidden from users on other networks. Device hiding is configured in the "Hide Devices..." dialog, which is accessed by clicking the "Hide..." button in the Port Info window.

You can elect to hide no devices, all devices, only a specific list of devices, or all devices except a specific list. You can hide your selection from all other ports or from a specific other port.

The administrator must use good judgment when setting up the list of hidden devices (or the list of not hidden devices). If the list contains more than a few devices, it will adversely affect performance.

In order for device hiding to be effective in a loop environment, all routers on a given network must hide the same devices. Otherwise, a "hidden" device would be accessible through another router that isn't hiding it.

Device hiding is not foolproof. Users could obtain a hidden device's AppleTalk address through some means other than looking for it on their network, such as running Inter•Poll on a portion of the internet that does have access to the device. Armed with that information, a user could access the device programmatically, even though the device is theoretically hidden.

AIR: Comparing TCP/IP Tunneling with DECnet Tunneling

Revised: 2/4/93
Security: Everyone

AIR: Comparing TCP/IP Tunneling with DECnet Tunneling

==========

Article Created: 3 February 1993

TOPIC ----------

This article compares Apple Internet Router TCP/IP tunneling with DECnet Tunneling.

DISCUSSION ----------

Although DECnet tunneling and TCP/IP tunneling are similar, there are some important configuration differences between them.

Since MacTCP supports only one TCP/IP port at a time, only one TCP/IP tunneling port will be supported per router. However, Apple Internet Router supports multipoint tunneling, in which each tunneling port may have any number of tunneling partners.

In contrast to Apple Internet Router, DECnet tunneling uses point-to-point tunneling. In other words, there is only one partner for each tunnel, and each tunnel is specified separately. Each VAX acting as an AppleTalk router may have any number of tunnels active on the same physical port, each one constituting a logical AppleTalk port. A separate tunnel is used to get to any individual partner, even if they are all on the same DECnet.

Another difference between TCP/IP tunneling and DECnet tunneling is that because a VAX can be a DECnet router as well as an AppleTalk router, it can route AppleTalk between two or more separate DECnet networks. Because MacTCP cannot be configured as a TCP/IP router, Apple Internet Router cannot route AppleTalk between two separate TCP/IP networks. That would have to be done by separate TCP/IP routers.

AIR: TCP/IP Tunneling, Tunnel Port Configuration (2/93)

==========

Article Created: 3 February 1993

TOPIC ----------

This article describes the Apple Internet Router (AIR) TCP/IP tunneling and TCP/IP tunnel port configuring.

DISCUSSION ----------

Installing the software for TCP/IP tunneling is separate from the installation of the Basic Connectivity package of Apple Internet Router. The WAN Extensions installation writes the following files to the target hard disk:

- MacTCP and AdminTCP
- The IPTunnel ADEV
- SNMPTCPTransport
- MacTCP Token Ring Extension (where applicable)

Apple Internet Router uses MacTCP to implement TCP/IP tunneling. Each exterior router is configured as an AppleTalk node and as an IP end node. The exterior routers encapsulate AppleTalk packets in TCP/IP packets and forward them across the TCP/IP network to other exterior AppleTalk routers, which decapsulate them onto their own AppleTalk internets.

From AppleTalk's perspective, TCP/IP is used solely to provide connectivity between exterior AppleTalk routers. Apple Internet Router is not a TCP/IP router or gateway.

TCP/IP tunneling is supported on Ethernet and Token Ring ports. Note that each of these ports can support both AppleTalk routing and TCP/IP tunneling simultaneously.

Configuring a TCP/IP Tunnel Port

To configure a TCP/IP tunneling port, double-click the IP Tunnel access method under the Ethernet or Token Ring port.

In the IP Tunnel Port Info dialog, you may enter the TCP/IP addresses of all other known exterior Apple Internet Router routers on the TCP/IP network, or a subset of those if you want to limit this router's tunneling partners. These addresses can either be entered as 4-byte quantities in the standard TCP/IP address format, or as TCP/IP names. When entered as names, the TCP/IP Domain Name Service is used to determine the associated TCP/IP address.

Optionally, the administrator can allow any other Apple Internet Router which has been explicitly configured with this router's address to be routed to, without explicitly having that router's address in the list. Tunneling to non-explicitly entered routers is enabled by unchecking the "Use only the host IDs listed" check box.

Note that where the AppleTalk Port Info window had a "Hide..." button, this Port Info window (and the one for DialUp) have an "Options..." button. For more information about the Options... button, search the Tech Info Library for an article titled "Apple Internet Router: WAN Network Options."

Apple Internet Router: WAN Network Options (2/93)

==========

Article Created: 3 February 1993

TOPIC

This article describes additional Wide Area Network WAN network options found in the DialUp, and IP Tunnel Setup Port Info windows. These options include Network Hiding, Network Number Remapping, Clustering, Hop Count Reduction, Hop Count Weighting, and Backup Paths.

DISCUSSION

Half-routing and tunneling ports both support a variety of options that are not applicable to AppleTalk ports. These options are selected in the Options… dialog box.

Network Hiding

It may be desirable, for security reasons, that certain networks in an internet not be made visible to other internets connected to the tunnel. This is accomplished simply by not providing information about these "hidden" networks to other exterior routers during the routing information exchange. You can choose to hide no networks, a specific list of networks, or all networks except a specific list.

Network hiding has advantages and disadvantages.

Some advantages are:

- Security
- The amount of routing information passed into the tunnel (and hence into all the remotely-connected internets) can be greatly reduced.

Some disadvantages are:

- Lack of selectivity – there is no access through the tunnel to any nodes on hidden networks.

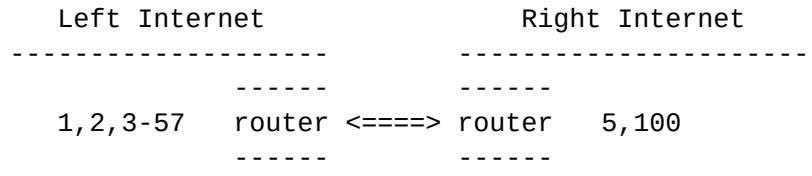
- A node on a hidden net will see all of the AppleTalk zones exported by all of the exterior routers on the tunnel, but will not be able to see any devices in these zones since those devices cannot respond to the node's NBP lookups.

Network Number Remapping

With AppleTalk WANs becoming larger and larger, we cannot safely assume that there will be no network number conflicts when connecting two or more WANs together. In fact, the large size of many WANs makes it more likely that there will be conflicts in such a case.

Network number remapping is a technique used to resolve network number conflicts between two networks without requiring reconfiguration of either one. Remapping is allowed on tunneling and half-routing ports only, not on AppleTalk ports.

As an example of the use of network number remapping, assume that one internet contains networks 1,2, and 3-57. If this internet is connected to another internet that contains network numbers 5 and 100, then a conflict would ordinarily result because network 5 exists in both internets.



With network number remapping, the Left router can be configured to remap network 5 into network 58 (or any other nonconflicting number). This allows the Left internet to see the Right internet's network numbers as 58,100.

At the same time, the Right router can be configured to remap networks 3-57 into networks 103-157. This allows the Right internet to see the Left internet's network numbers as 1,2,103-157.

Loop configurations are not allowed when remapping is active. Looking at the previous example again, see what would happen if there were a loop configuration here. Remapped network numbers would loop back to the router that performed the remapping in the first place. This time, they would be viewed as new networks, and could be remapped again, causing an infinite loop of remapping, broken only by hop count limitation.

Apple Internet Router attempts to detect such loops at startup, and will not activate a remapping port if it would create such a loop. If a loop is detected later, the remapping port will be brought down.

Network number remapping is enabled through the Options dialog. Here, you specify a network range to remap remote network numbers into.

In a WAN with more than one tunnel or half-routing link, network numbers may be repeatedly remapped as they travel across the WAN. This does not

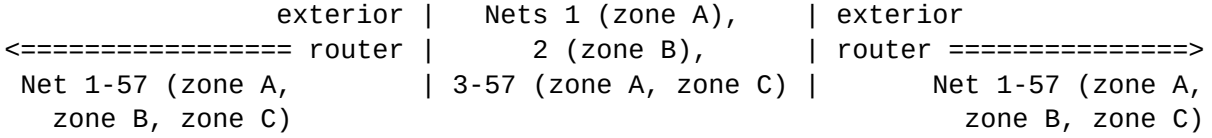
present a problem, since all the remapping information is handled locally, and it is transparent to the user.

For network number remapping to work, all network number references in each packet traveling between the two networks must be remapped before the packet enters the new network. This includes source and destination network numbers in the DDP header, network numbers carried in NBP and RTMP packets, and network numbers in ZIP query and response packets.

Note that this also includes network numbers obtained by clients of these protocols and carried as part of the DDP data field. It is impossible for routers to be aware of all such instances of network numbers in data, so remapping will not always work in these cases. For this reason, Apple advises against doing network management across remapped links, because network management data often contains network numbers. Instead, manage each internet separately.

Clustering

Clustering is a way of representing a portion of the internet as a single, multi-zone extended network. Clustering is available only on tunneling and half-routing ports, and then only when remapping is active. Like remapping, clustering is applied by an exterior router to network information it receives from other exterior routers. The clustering exterior router represents the remote internets to its own local internet as single, multi-zone extended networks.



For example, the internet shown in the center of the above diagram consists of three separate networks: two that each have a single network number and zone name (1, Zone A and 2, Zone B) and one that has a network number range and a zone list (3-57, Zone A, Zone C). With clustering active, this internet would be represented to other internets as a single extended network with network numbers 1-57 and the zone list Zone A, Zone B, Zone C.

Clustering imposes some limitations on network design. All the networks in a cluster must appear, from an RTMP point of view, to be the same number of hops away.

A more serious limitation is that representing a portion of the internet this way amounts to taking a snapshot of that portion and passing it to the rest of the internet. If the picture changes, the snapshots are generally not updated.

There are two possible cases where this can happen. First, if a new network comes up in the clustered portion, and its network number range is outside the cluster range, that network must be represented individually to the rest of the internet because the cluster range cannot easily be grown to include the new network.

Second, if a new network comes up within the cluster and its network number range is within the cluster range, then it automatically becomes part of the cluster. However, if its zone list contains a zone name not in the cluster's original zone list, that zone name will not appear in the cluster's zone list until the clustering routers are restarted.

Hop Count Reduction

When two internets are connected through a half-router or a tunnel, it is easy to see that the maximum distance across the resulting internet could easily exceed 15 hops. For this reason, Apple Internet Router tunneling and half-router ports allow you to turn on the hop count reduction feature, which appears in the Options dialog as "Allow more than 15 hops".

Hop count reduction is available only on tunneling and half-routing ports, and only when remapping is active. Remapping is a requirement because, for hop count reduction to be safe, there must be no loops across the hop count reduced link, and Apple Internet Router prevents loops in a remapped environment. If loops were allowed, a reduced hop count packet could travel forever on the network.

When hop count reduction is active on a port, all networks that are accessible out that port appear to be one hop away. This makes the remote networks accessible by all the networks in the local internet, regardless of their actual distance in hops.

Hop Count Weighting

When multiple paths are available between two networks, the network administrator may wish to direct traffic to a preferred path. This is especially important when one path includes a slow link or tunnel. Current AppleTalk protocols will choose the path with the fewest hops, without regard to the speed of the link. If two paths are equal hops, traffic will alternate between them at ten-second intervals.

Hop count weighting allows you to artificially increase the hop count for a half-routing port or tunnel by a number from 1 to 14. By weighting a link as a large number of hops, you can cause traffic to take an alternate route if one is available. This feature also allows you to implement a more accurate modeling of the internet when slow links are involved, by weighting links according to their speed (higher hop counts for slower links).

Hop count weighting may be used whether or not network number remapping is on. However, it may not be meaningful if remapping is on because there will be no loops or redundant paths in that case.

Backup Paths

Tunneling and half-routing ports can be designated as "backup paths" only when remapping is not on (since redundant paths are not allowed with remapping). If a port is designated as a backup path, then it will not be

used for data forwarding if an alternate route between the half-routers or tunneling routers is available.

The link will be used only for the exchange of routing information between the two half-routers. This exchange is necessary to determine when the backup path needs to be made active. Once a backup link becomes active, that link may continue to be used for some amount of data forwarding, even if the primary link comes back up. The link won't fully return to backup status until the router is restarted.

If a half-routing or tunneling port is designated as a backup port, a hop count weight may also be assigned for use if the port becomes active.

Apple Internet Router: Tunneling Definitions and Concepts (2/93)

==========

Article Created: 3 February 1993

TOPIC ----------

This article describes Wide Area Network support through tunneling. Tunneling definitions and concepts are presented.

DISCUSSION ----------

Apple Internet Router supports wide area networks through tunneling and half-routing ports. These two types of ports, unlike AppleTalk routing ports, use AppleTalk Update-Based Routing Protocol (AURP) as a replacement for Routing Table Maintenance Protocol (RTMP) in order to reduce network overhead.

The important point to keep in mind is that Apple Internet Router can safely assume that any routers it sees through tunneling or half-routing ports are other Apple Internet Routers or Apple Internet Router-compatible routers. Therefore, it is safe to use AURP on these ports, since it is known that the other router is also using it.

Tunneling

In AppleTalk terminology, tunneling means connecting two or more AppleTalk networks by using a "foreign" network system as a conduit between them. Tunneling uses "exterior" AppleTalk routers to connect the AppleTalk internets with the foreign data link. Each exterior router is configured as a node on both the AppleTalk network and on the foreign network. The AppleTalk packets are encapsulated in the protocol of the foreign network as they travel across it.

Tunneling does not imply any connectivity between the AppleTalk nodes and the nodes on the foreign network. The foreign network is simply passing the AppleTalk packets, as data, between nodes. In other words, a tunneling

router is not a router for, or a gateway to, the foreign network system, although other programs providing these functions could run simultaneously.

Each exterior router must know specifically what other exterior routers are its tunneling partners. This is accomplished either by configuring each router with a specific list of partners, or by allowing a router to tunnel with partners that have been configured to know about it.

There are two types of tunnels:

- Point-to-point, in which each tunnel connects only two exterior routers. If you wish to tunnel to more than one exterior router, then you set up a separate tunnel to each one.

- Multipoint, in which each exterior router can tunnel to more than one partner. This way, there is no need to have more than one tunnel on any exterior router.

Multiple, independent tunnels can exist on the same foreign network system. When properly configured, such tunnels can be invisible to, and secure from, each other. They simply happen to share the same data link as a media for their respective tunnels.

The first implementation of tunneling for AppleTalk was DECnet tunneling, which has been supported in AppleTalk for VMS and Digital's PATHWORKS for Macintosh for several years. Apple Internet Router and its extensions will add TCP/IP and X.25 to the list of networks that can tunnel AppleTalk. It is also expected that there will be third-party extensions for tunneling across such foreign network systems as T1, Frame Relay, SMDS, and others.

A fully-connected tunnel is one in which all exterior AppleTalk routers know about all the other exterior routers. A tunnel is partially-connected if some exterior routers on the tunnel do not know about every other exterior router on the tunnel.

AURP: History, Architectural Model, and Events (2/93)

==========

Article Created: 4 February 1993

TOPIC ----------

This article describes AppleTalk Update-Based Routing Protocol (AURP) history, architectural model, and AURP events.

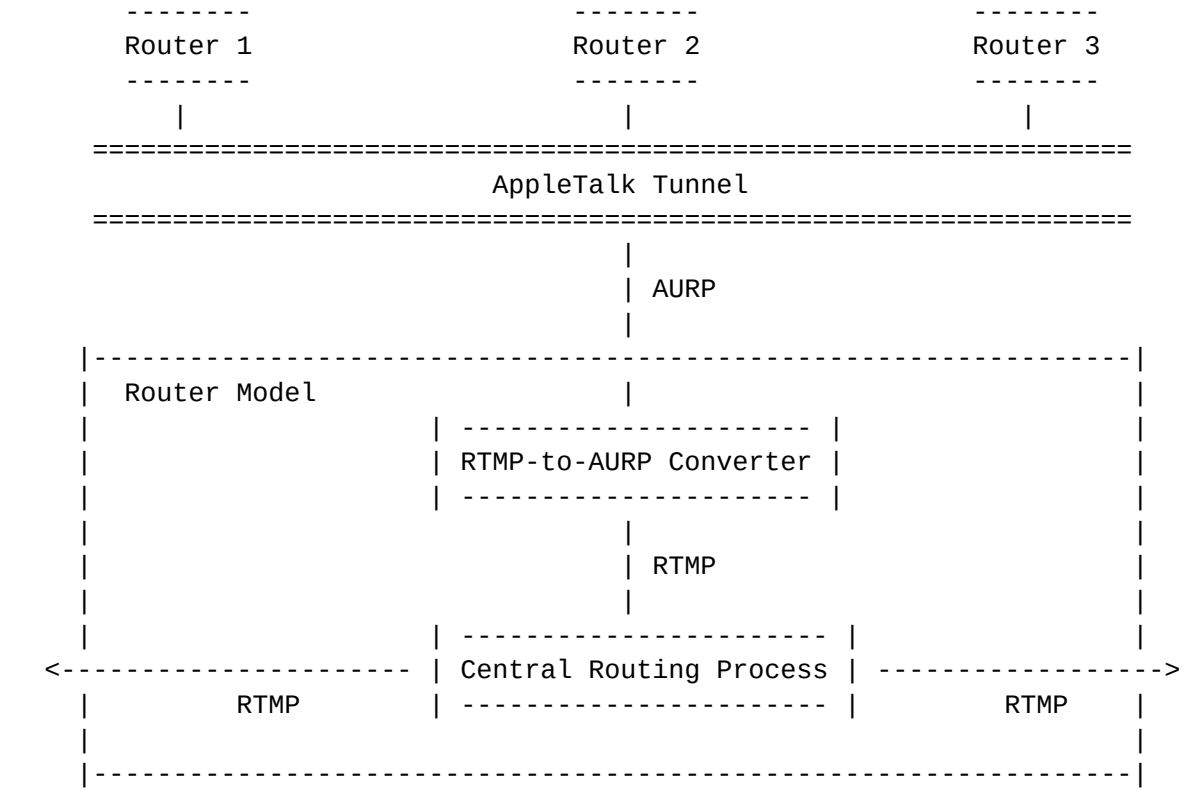
DISCUSSION ----------

Routing Table Maintenance Protocol (RTMP) works by having the router tables broadcast to other routers every 10 seconds. This transportation of data can reduce network bandwidth as well as incur traffic costs on lines that are per/packet charged. Originally this implementation worked fine because networks existed primarily in LAN configurations, and in LAN environments the overhead incurred by RTMP was not significant. The development of AURP has been going on for quite some time. AURP has been under development for over 2 years in concert with the Internet Engineering Task Force (IETF). This group works on networking issues and in the case of AURP has helped to define the standard for AURP.

As networks branch out in terms of connectivity there is a need to support solutions such as half-routing and network tunneling. Half-routing, is good in that it is inexpensive, but it doesn’t have high bandwidth. LocalTalk is 230 kbps and the router requires a minimum of 9600 bps modems for half-routing. It is not difficult to see that the through-put will be less in the half-routing environment. The problem is that while LocalTalk can afford the overhead of RTMP traffic it become problematic on lower capacity links. With the ability to tunnel and interconnect large internets, if the RTMP model was still being used there would be significant bandwidth reduction as a result of propagating the routing information between tunneled networks.

The AURP Architectural Model

The goal of AURP is to provide all the functionality of RTMP and Zone Information Protocol (ZIP) with almost none of the traffic overhead currently associated with these AppleTalk routing protocols. AURP only exports information about networks in its local AppleTalk internet. This is known as split-horizon data reduction. That is, AURP never exports information about networks accessible out the tunnel. In the simple case it would be like we are having a conversation and I tell you that by the way I can talk to you. This wouldn't be very useful to know since we are already talking. In the following figure we see how an exterior router supports both RTMP and AURP.



AURP Architectural model

Routers will speak AURP out the tunnel via an RTMP to AURP converter. This allows the new router to extend the network while maintaining compatibility with the internet that it will be connected to.

AURP Events

It is important to remember that a router will notify other connected routers of certain events that take place. The following is a list of the type of events that will be sent to routers that have requested notification if these updates occur:

- The addition of a new, exported network, that is visible to the receiving router.

- A change in the path to an exported network—which causes the exterior router to access that network through its local internet, rather than

through a tunneling port.

- The removal of an exported network from the exterior router’s routing table.
- A change in the path to an exported network—which causes the exterior router to access that network through a tunneling port, rather than through its local internet.
- A change in the distance to an exported network.
- A change to a zone name in the zone list of an exported network—an event not currently supported by ZIP.
- The exterior router goes down or is shut down.

System Enablers: Current Versions & Change History (2/97)

==========

Article Created: 4 February 1993
Article Reviewed/Updated: 24 February 1997

TOPIC ----------

This article lists the current versions of the Macintosh System Enablers, and change history information.

DISCUSSION ----------

In the past, when Apple has come out with new computers, Apple has also revised the system software so it knows how to start up these new computers. Revising the whole system software, however, is a very time-consuming process, and Apple has been releasing new computers much more rapidly than it did in the past.

The solution to this dilemma is the System Enabler file. A System Enabler contains everything that is needed to boot (start up) a new computer (or computers). All of the computers that have come out since system software 7.1 (September 1992) require a System Enabler to start up.

With System 7.5, a universal enabler which supports all computers introduced up to the introduction of System 7.5, has been developed. Future computers will have an enhanced enabler shipped with them.

With the release of system 7.5.3 or later, the listed computers in this article do not require a System Enabler.

Current Macintosh System Enablers

NOTE: The Plus, SE, SE/30, Classic, Classic II, LC, LC II, LC 580, Mac II, IIx, IIcx, IIsi, IIci, IIfx, PB 100/140/145/170, Quadra 700, 900, and 950 do NOT need a System Enabler. Also, the Performa 200, 400, 405, 430, and 410 do NOT require a System Enabler.

Begin_Table

Macintosh	System Enabler Used	Current Version	Note
Macintosh Centris 610	System Enabler 040	1.1	D
Macintosh Centris 650	System Enabler 040	1.1	D

End_Table

NOTES:

A - System Enabler 131 replaces System Enabler 111 and System Enabler 121.

B - Express Modem users should also install the Duo Battery Patch (Extension).

C - Requires System Software version 7.1.1 or later. System Software 7.1.1 and PowerBook Duo Enabler 2.0 ship with the PowerBook Duo 280 and 280c.

D - No System Enabler is required for this Macintosh under System 7.5 or later.

E - Power Macintosh 6100/66, 7100/80, 8100/100, and 8100/110 require System 7.5 and Finder 7.5.1 or later.

F - Requires System Software version 7.5.2 or later.

G - No System Enabler is required for this Macintosh under System 7.5.3 or later.

H - No System Enabler is required for this Macintosh under System 7.5.5 or later.

I - These computers shipped with 7.5.5 and require the enabler with it. These do not support Mac OS 7.6. Will suppor Mac OS 7.6.1 when it ships.

J - The Power Macintosh 4400/200 shipped with 7.5.3 and requires the enabler

with it. It does not support Mac OS 7.6. Will support Mac OS 7.6.1 when it ships.

Enabler Change History

PowerBook 150 Enabler

1.1	First release.

PowerBook 500 Series Enabler

1.0.2	First release.

PowerBook 5300/2300/190 Enabler

1.0.2	First release.
1.0.8	Added support for NiMH batteries.
1.1	Reference release for 5300 and 190 builds.
1.2	Reference release for 2300 builds.
1.2.1	Fixed several issues on PowerBook 5300/2300/190 computers.
1.2.4	System software enhancements improving reliability and performance

PowerBook Duo Enabler

1.0	First release. Replaced System Enabler 201.
2.0	Includes support for type III batteries, better support for dual monitors, and multiple resolution support for color displays. Added support for PowerBook Duo 280 and 280c.

PowerPC Enabler

1.0	First release.
1.0.1	Fixes some video and serial communications problems.
1.0.2	Improved Energy Star compatibility for certain monitors connected to the built-in video port.
1.1	Manufacturing release only.
1.1.1	Added support for speed bumped Power Macintosh. Requires Finder 7.1.5.

PowerPC Upgrade Card Enabler

1.0	First release.
1.0.1	Includes Communications Toolbox 1.1

System Enabler 001

1.0	First release.
1.0.1	Improved support for high speed serial communications and improved accuracy of the system clock. Also addressed a rare problem where floppies may not be ejected properly at shutdown.

System Enabler 003

1.0 First release.
1.1 Updated in System Update 3.0. Minor bug fix for compatibility.

System Enabler 040

1.0 First release.
1.1 Added support for Quadra 610 and Quadra 650.

System Enabler 065

1.0 First release for Macintosh LC 475 and Macintosh Quadra 605.
1.1 Added support for Macintosh LC 575.
1.2 Minor bug fix for compatibility.

System Enabler 088

1.0 First release.
1.0.1 Required for System 7 Pro 7.1.1 support.
1.1 Added support for Quadra 660AV.
1.2 Corrects problems with serial port, involving printing to LaserWriter 310 Select and crashing in certain instances when receiving a fax and network traffic is high.

System Enabler 131

1.0 First release to support the PowerBook 180c. Replaced System Enabler 121 (supporting 165c) as well as System Enabler 111 (supporting 160 & 180).
1.0.2 Corrected a problem involving the serial driver. If a user has the serial driver open, but is not transmitting, and then puts the PowerBook to sleep, any attempt to transmit on waking, would cause the system to hang.
1.0.3 Added support for the PowerBook 165.

System Enabler 401

1.0.4 First release.
1.0.5 Fixed a problem involving erratic mouse movement with Apple II mouse-based applications running on the Apple IIe card installed in the PDS.

System Enabler 403

1.0 First release for Macintosh LC 520.
1.0.1 Manufacturing release only.
1.0.2 Added support for Macintosh LC 550.

System Enabler 404

1.0 First release.

System Enabler 405

1.0 First release.

System Enabler 406

1.0 First Release.

System Enabler 701

1.0 First release for Power Macintosh 9500, requires System software 7.5.2.
1.1 New enabler for Power Macintosh 9500 and Power Macintosh 7200 only, requires System software 7.5.2.
1.2 New enabler for Power Macintosh 7500 and Power Macintosh 8500 only, requires System software 7.5.2.

Where to Find System Enablers

These articles can help you locate software updates mentioned here:

Centris 610 & 650, Quadra 800: Sound System Overview (7/94)

Revised: 7/28/94
Security: Everyone

Centris 610 & 650, Quadra 800: Sound System Overview (7/94)

==========

Article Created: 9 February 1993
Article Reviewed/Updated: 28 July 1994

TOPIC ----------

This article describes the sound system in the Macintosh Centris 610, Centris 650, and Quadra 800.

The information in this article relative to the Centris 610 and Centris 650 is also relevant to the Quadra 610 and Quadra 650.

DISCUSSION ----------

The sound system used by the Centris 610, Centris 650, and Quadra 800 lets you play back 8-bit stereo sound, and record single-channel (mono) 8-bit sound input from a microphone or line inputs.

As in the Quadra 700 and 900, the DFAC chip is used to support sound input.

Unlike the Quadra 700, the sound playback path uses discrete PWM converters similar to those used in the PowerBook 170 for sound output.

Separate headphone and speaker amplifiers are used, which allows playback of CD-ROM audio through the sound system. CD-ROM audio may be digitized by the sound input circuitry.

Article Change History:
28 Jul 1994 - Added reference to Quadra 610 and 650 to aid in searching.

StyleWriter: Using with the StyleWriter II software (10/94)

==========

Article Created: 18 February 1993
Article Reviewed/Updated: 27 October 1994

TOPIC ----------

Can I use the StyleWriter II printer software on the original StyleWriter? Will the head cleaning option in the StyleWriter II driver damage the original StyleWriter printer?

DISCUSSION ----------

The StyleWriter II driver and the head cleaning option will not harm the original StyleWriter printer.

The only combination that may cause damage is using an original StyleWriter cartridge in a StyleWriter II.

When you use the StyleWriter II printing software with the original StyleWriter printer, you can print in grayscale and share the printer over a network with the GrayShare software.

A GrayShare software upgrade disk is available through online services Apple publishes software updates on.

These articles can help you locate software updates mentioned here:

Video Displays: Brightness and Color Uniformity (2/93)

Revised: 2/16/93
Security: Everyone

Video Displays: Brightness and Color Uniformity (2/93)

==========

Article Created: 10 February 1993

TOPIC ----------

This article discusses brightness and color uniformity in large-screen monitors.

DISCUSSION ----------

Color and brightness uniformity is a specification that measures the overall distribution of color purity and brightness on a monitor when viewing an all-white raster.

The specification for color uniformity is quite complex and must be tested under laboratory conditions with specialized equipment. Color uniformity imperfections appear as hazy colored areas on an otherwise all-white raster. These color "patches" may appear in different locations on each CRT, but they usually appear around the edges of the monitor and are more likely to occur on large-screen monitors.

Environmental conditions may also contribute to color purity imperfections. Both the earth's magnetic field as well as other stray magnetic fields can affect monitor performance. This is true even for monitors with automatic degaussing circuits, such as Apple's 21-inch RGB monitor.

Brightness uniformity imperfections are similar to those of color uniformity. The only difference is that when viewing an all-white screen, brightness uniformity imperfections appear as grayish cloud-like patches.

While it may be objectionable to some customers, it is normal for CRTs to exhibit some color uniformity and/or brightness uniformity imperfection somewhere on the display screen. No 21-inch RGB monitor from any manufacturer will present a pure white screen when viewing an all-white raster.

Therefore, CRT replacement is not the solution to color and brightness uniformity imperfections. It is important that customers understand the limitations that exist in the design of large-screen CRTs.

TITLE

Apple Color Monitors: Cause of Thin Horizontal Line(s)

Article ID: 11497
Created: 2/5/93
Modified: 1/11/00

TOPIC

Why do some Apple color monitors have a thin line or lines across the screen?

DISCUSSION

The thin light gray horizontal line across the entire width of the display image when you display a white or light background is called a grid stabilization wire. The wire stabilizes the grid of fine vertical wires that define the tron-style display.

The CRT has a specially constructed aperture grill that improves its convergence and produces a sharp and clear image. The aperture grill is a grid of vertical wires located just behind the CRT screen. These CRTs require a horizontal stabilizing wire or wires to help support the aperture grill. The supporting wires, which are thinner than a human hair, stabilize the aperture grill against shocks.

Typically, displays with a viewing area of 15 inches or less have a single horizontal grid wire approximately one third from the bottom of the display image. Displays larger than 15 inches typically have two wires, each about one-quarter to one-third of the way from the top and bottom of the display image.

The lines are common to all tron-style displays, and are not screen defects. Their presence cannot be adjusted out or eliminated by repairing or replacing modules in the display.

These Apple products include a tron-style CRT:

- 13-inch High Resolution RGB Monitor
- 14-inch Macintosh Color Display
- Multiple Scan 17 and 20 Displays
- AppleVision 1710 and AppleVision 1710AV Displays
- Macintosh 16-inch Color Display
- Macintosh Color Classic
- AudioVision 14 Display
- Macintosh TV
- Macintosh LC 520, 550, 575
- Performa 550, 560, 575, 577, 578
- ColorSync 17-inch Display
- ColorSync 20-inch Display
- AppleVision 750 Display
- AppleVision 750 AV Display
- AppleVision 850 Display
- AppleVision 850 AV Display
- Apple Studio Display 17 (16 inch viewable image size)
- Apple Studio Display 21-inch (19.8-inch viewable image size)

Apple Color Monitors: Cause of Visible Line(s) (10/96)

Revised: 10/25/96
Security: Everyone

Apple Color Monitors: Cause of Visible Line(s) (10/96)

==========

Article Created: 18 February 1993
Article Reviewed/Updated: 25 October 1996

TOPIC ----------

Why do some Apple color monitors have a thin line or lines across the screen?

DISCUSSION ----------

When you display a white or light background on some Apple color displays, you may notice a thin gray horizontal line or lines across the screen. These thin lines are supporting or stabilizing wires inside the CRT and are part of Sony’s Trinitron CRT technology. These Apple displays include a Sony Trinitron CRT:

- 13-inch High Resolution RGB Monitor
- 14-inch Macintosh Color Display
- Multiple Scan 17 and 20 Displays
- AppleVision 1710 and AppleVision 1710AV Displays
- Macintosh 16-inch Color Display
- Macintosh Color Classic
- AudioVision 14 Display
- Macintosh TV
- Macintosh LC 520, 550, 575
- Performa 550, 560, 575, 577, 578

Sony Trinitron CRTs have a specially constructed aperture grill which improves the CRT’s convergence and produces a sharp and clear image. The aperture grill is a grid of vertical wires located just behind the CRT screen. These CRTs require a horizontal stabilizing wire or wires to help support the aperture grill. The supporting wires, which are thinner than a human hair, stabilize the aperture grill against shocks.

The Macintosh 13-inch Hi-Res RGB Monitor and 14-inch Macintosh Color Display have a single support wire across the bottom third of the display. The Macintosh 16-inch Color Display and the Multiple Scan 17 and 20 Displays have two support wires visible across the top and bottom thirds of the screen.

Note that these are not screen defects. Their presence cannot be adjusted out or eliminated by repairing or replacing modules in the display.

A/UX 3.0 Supports New Version of nawk (2/93)

Revised: 2/16/93
Security: Everyone

A/UX 3.0 Supports New Version of nawk (2/93)

==========

Article Created: 4 February 1993

TOPIC ----------

Where can I get nawk for A/UX 3.0?

DISCUSSION ----------

The version of 'awk' that comes with A/UX 3.0 was based on the new version of awk (nawk) from AT&T ToolChest 1988-1989.

Actually the 'nawk' has been in A/UX since A/UX 2.0.1 release. A/UX, however, still uses the name of 'awk' instead of 'nawk'.

To verify that we are using the new version of 'awk', search for the built-in gsub from 'man awk' or 'strings /bin/awk', if it exists, it is nawk. The old awk does not support the gsub function.

LaserWriter Select 300: Description (2/93)

==========

Article Created: 9 February 1993

TOPIC ----------

This article describes the LaserWriter Select 300.

DISCUSSION ----------

Overview

The Apple LaserWriter Select 300 provides high-quality laser printing, PostScript expansion, printer sharing from multiple Macintosh computers, and extensive paper-handling capabilities.

Designed for individual use, the LaserWriter Select 300 printer has 39 scalable TrueType fonts, including such popular font families as Times, Helvetica, and Palatino. The LaserWriter Select 300 also comes with Apple's FinePrint technology to smooth out lines and curves in your text.

You can add Apple's PhotoGrade technology to print documents containing graphics or images -- with over 90 levels of gray. Adobe Level I PostScript compatibility is available through the PostScript Option.

Apple's GrayShare software also lets you share your LaserWriter Select 300 with other users over a network.

The LaserWriter Select 300 features a standard cassette tray that holds 250 sheets of paper, and a manual paper feed tray. You can add an optional 250- or 500-sheet paper feeder, a 250-sheet legal cassette, an envelope cassette, and a multipurpose tray for paper or envelopes.

Print quality

- 300 dpi with FinePrint for high-quality text
- Grayscale printing for sharp graphics
- 39 scalable TrueType fonts for printing a wide range of styles and sizes
- PhotoGrade capable

Expandability

- Adobe PostScript option
- PhotoGrade Upgrade Kit for printing high-quality scanned images, illustrations, and graphics
- User-installable paper handling options

Versatility

- 250-sheet automatic tray and manual feed tray included
- Optional paper-handling capabilities for up to 800 sheets of paper (includes different media)
- Compact design fits any desktop
- Printer sharing with GrayShare

LaserWriter Select 300: Technical Specifications (4/94)

==========

Article Created: 9 February 1993
Article Reviewed/Updated: 12 April 1994

TOPIC ----------

This article provides technical specifications for the LaserWriter Select 300 printer.

DISCUSSION ----------

Marking Engine and Controller

- Fuji Xerox laser
- Application-Specific Integrated Circuit (ASIC)

Print Quality

- 300 dpi, enhanced with FinePrint
- Grayscale printing with GrayShare software
- Optional PhotoGrade for high-quality scanned images
- Adobe PostScript option

Memory

- Standard 512K of RAM with compression
- Optional 1MB and 4MB upgrades

Speed

- Five pages-per-minute maximum (actual speed varies depending on images printed and computer used)

Interface

- High-speed (909K) RS-422 serial interface

System Requirements

- Any Apple Macintosh personal computer with at least 1MB of RAM and a hard disk drive
- System software version 6.0.7 or later
- Recommended with System 7 or later: 4MB or more of RAM

Fonts

- 39 fonts from the following font families: Avant Garde, Bookman, Chicago, Courier, Geneva, Helvetica, Helvetica Narrow, Monaco, New Century Schoolbook, New York, Palatino, Symbol, Times, Zapf Chancery, and Zapf Dingbats

Recommended Duty Cycle

- Minimum life expectancy: 150,000 pages
- Toner cartridge: 4,000 pages at 5% density

Paper Capacities

- Standard
  - Manual feed tray
  - 250-sheet feeder
- Optional
  - 250- or 500-sheet feeder
  - 50-sheet multipurpose tray (also holds up to five envelopes)

Printable Area

- Maximum printable line: 8.0 in (203.2 mm)
- Minimum top, bottom, left, and right margins: 0.25 in. (6.35 mm)

Print Materials

- 16- to 36-lb. (60 to 135 g/m2) bond via manual feed
- Paper: U.S. letter, U.S. legal, A4, executive
- Most letterhead and colored stock, labels, and envelopes
- Medium-weight photocopier transparencies

Size and Weight

- Height: 8 in. (25.3 cm)
- Width: 15 in. (38 cm)
- Depth: 18.3 in. (45 cm)
- Weight: 26 lb. (12 kg)

Operating Environment

- Temperature: 50 to 90° F (10 to 32° C)
- Humidity: 20% to 80% noncondensing
- Toner cartridge transit environment: –4 to 104° F (–20 to 40° C)

Power Requirements

• U.S./Japan: 100 to 115 V, 50 to 60 Hz
• Europe/Australia: 220 to 240 V, 50 Hz

Power Consumption

• 450 W maximum at 115 V or 220 V

Article Change History:
12 April 1994 - Updated maximum paper weight.
21 March 1994 - Corrected the metric paper weights

LaserWriter Select 300: Grayscale Needs Color QuickDraw (2/93)

Revised: 2/8/93
Security: Everyone

LaserWriter Select 300: Grayscale Needs Color QuickDraw (2/93)

==========

Article Created: 9 February 1993

TOPIC ----------

Can the LaserWriter Select 300 print documents in grayscale mode from Macintosh systems that do not have Color QuickDraw in ROM?

DISCUSSION ----------

The LaserWriter Select 300 cannot print documents in grayscale mode when directly connected to a Macintosh computer that does not have Color QuickDraw in ROM. It can print documents only in black and white. This due to the GrayShare driver, which requires Color QuickDraw in order to image grayscale documents.

If you are sharing a LaserWriter Select 300 printer and want to print documents in grayscale mode, the Macintosh system that the printer is directly connected to must have Color QuickDraw in ROM.

The following Macintosh computers are compatible with the LaserWriter Select 300 although they do not have Color QuickDraw in ROM:

- Macintosh Plus
- Macintosh SE
- Macintosh Portable
- Macintosh Classic

The only workaround is to connect your LaserWriter Select 300 to a Macintosh with Color QuickDraw in ROM and share it over a network. You can then print in grayscale mode to the shared printer from a Macintosh without Color QuickDraw in ROM.

LaserWriter Select 300: Connectivity (12/94)

Revised: 12/12/94
Security: Everyone

LaserWriter Select 300: Connectivity (12/94)

==========

Article Created: 9 February 1993
Article Reviewed/Updated: 12 December 1994

TOPIC ----------

This article describes the connectivity features of the LaserWriter Select 300 printer.

DISCUSSION ----------

The LaserWriter Select 300 printer contains one communications port: a high-speed serial port for Macintosh connectivity. This printer has no LocalTalk port; it can, however, be shared over a network with the included GrayShare printer driver software.

The LaserWriter Select 300 is a QuickDraw printer and does not support any other type of printer control language. This printer is designed for use only with the Macintosh computer.

Serial Port

The serial port on the LaserWriter Select 300 is a special externally clocked high-speed serial port supporting baud rates up to 909 kbps. There are no switches or jumpers for configuring the serial port baud rate.

Article Change History:
12 Dec 1994 - Corrected Serial port information.

LaserWriter Select 300: Grayscale Printing (2/93)

Revised: 2/8/93
Security: Everyone

LaserWriter Select 300: Grayscale Printing (2/93)

==========

Article Created: 9 February 1993

TOPIC ----------

The LaserWriter Select 300 can print grayscale images in two ways:

- It can use the standard GrayShare driver.
- With a memory upgrade, the LaserWriter Select 300 can use PhotoGrade technology.

DISCUSSION ----------

GrayShare Printing

The standard GrayShare printer software enables the LaserWriter Select 300 to print dithered grayscale printing. The LaserWriter Select 300 with the GrayShare driver can print up to 33 shades of gray. The GrayShare printer software also provides networking capability and provides image scaling in 1% increments.

To print documents using the standard grayscale mode on the LaserWriter Select 300, simply select the "Grayscale" option from the "Image" setting in the Print Dialog Box.

PhotoGrade Printing

PhotoGrade software allows you to use the printer sharing and image scaling attributes of the GrayShare driver while providing documents which are near photographic quality. The LaserWriter Select 300 with the PhotoGrade driver can print over 90 shades of gray.

PhotoGrade uses complex halftoning algorithms and outputs two to four times as much information as the GrayShare driver, so it requires extra printer

memory. To enable PhotoGrade on the LaserWriter Select 300, you must add a 4MB memory module. Documents take longer to print when PhotoGrade is used.

To print documents using PhotoGrade on the LaserWriter Select 300, simply select the "PhotoGrade" option from the "Image" setting in the Print Dialog Box.

Tech Info Library

LaserWriter Select 300: System Requirements (2/93)

Revised: 2/8/93
Security: Everyone

LaserWriter Select 300: System Requirements (2/93)

==========

Article Created: 9 February 1993

TOPIC ----------

This article discusses the system requirements of the LaserWriter Select 300.

DISCUSSION ----------

Compatibility

The LaserWriter Select 300 requires a Macintosh computer with 1MB of RAM, a hard disk, System 6.0.7 or later, and the TrueType INIT (startup program). For best performance, Apple recommends at least 2MB of RAM for System 6.07 and 6.08 users, or 4MB RAM for System 7 users.

The LaserWriter Select 300 can use Adobe Type 1 and TrueType fonts, including fonts in a two-byte format. Adobe Type 1 fonts require the presence of Adobe Type Manager.

Performance

The LaserWriter Select 300 does not have a central processor on its logic board and is dependent on the host Macintosh for page processing. Its performance is directly related to the type of Macintosh used and the complexity of the document. As a general rule, the faster the CPU (microprocessor) and the simpler the document, the faster the LaserWriter Select 300 will print.

To get the best performance from your LaserWriter Select 300, Apple recommends you use a 68020-based Macintosh or faster.

Tech Info Library Article Number:11509

LaserWriter Select 300: Features of Printer Drivers (2/93)

Revised: 2/8/93
Security: Everyone

LaserWriter Select 300: Features of Printer Drivers (2/93)

==========

Article Created: 9 February 1993

TOPIC ----------

This article describes the features of the LaserWriter Select 300's printer drivers.

DISCUSSION ----------

The LaserWriter Select 300 supports the following operating systems:
• Macintosh System Software 6.0.7 and 6.0.8
• Macintosh System Software 7.0 and later

The LaserWriter Select 300 driver supports these special features: background printing, multiple paper sources, grayscaling, and print density control.

You can select background printing in the Chooser. Note that background printing uses your computer's processing power and may cause your computer to briefly slow down as your document prints.

With an option in the Print Dialog Box, you can select which bin to print from. You can also print the first page of a document from one tray and the rest of the document from a different tray (for example, to print the first page on letterhead paper, and all subsequent pages on plain paper).

The Image setting in the Print Dialog Box allows you to choose between black and white, grayscale, and PhotoGrade printing. (Note that you must add a 4MB memory upgrade to your printer before you can use PhotoGrade.) Documents print faster in black and white than in PhotoGrade or grayscale mode.

The Options selection in the Print Dialog Box contains the Print Density

control. The LaserWriter Select 300's print density can be controlled only by software; it has no hardware print density control.

LaserWriter Select: Indicator Lights (2/93)

Revised: 2/8/93
Security: Everyone

LaserWriter Select: Indicator Lights (2/93)

==========

Article Created: 9 February 1993

TOPIC

This article describes the function of the indicator lights on the LaserWriter Select 300 and LaserWriter Select 310 .

DISCUSSION

The LaserWriter Select 300 and 310 have three indicator lights that indicate printer status. Each light has an icon below it to describe its function.

- On the left is the Ready/In Use indicator. Its icon is a circle.
- In the middle is the Paper Out indicator. Its icon is a horizontal rectangle with the top right corner turned down.
- On the right is the Paper Jam indicator. Its icon is two rollers with a jagged line between them.

The table below adds further details.

Indicator Color	Name	Function
GREEN	Ready/In Use	ON when the printer is ready to print. FLASHES when the printer is not ready to print due to warm-up (WAIT status). FLASHES while the controller is preparing data for printing.

		OFF when the printer is not ready to print due to an error condition.
AMBER	Paper Out	ON when printer status indicates paper out in CASSETTE FEED mode or MULTI-PURPOSE TRAY mode. OFF otherwise.
AMBER	Paper Jam	ON when printer status indicates paper jam. OFF otherwise.

If both the Paper Out and Paper Jam lights flash continuously, contact an Authorized Apple Service Provider.

LaserWriter Select 300: Memory Configurations

Revised: 2/8/93
Security: Everyone

LaserWriter Select 300: Memory Configurations

==========

Article Created: 9 February 1993

TOPIC ----------

This article discusses memory configuration and expansion for the LaserWriter Select 300 printer.

DISCUSSION ----------

The LaserWriter Select 300 is shipped with 512K of built-in memory. Because the LaserWriter Select 300's innovative design includes compression and decompression of the page to be printed, additional memory isn't required for most applications.

With a 1MB memory SIMM, the LaserWriter Select 300 can be expanded to 1.5MB of memory. This is needed only for printing complex documents.

To add PhotoGrade capabilities to your LaserWriter Select 300, add a 4MB memory SIMM and expand your printer to its maximum 4.5MB of memory.

The LaserWriter Select 300 has one memory expansion slot, which uses the same 80ns fast-page mode 30-pin memory SIMMs as the Macintosh IIci and IIsi memory SIMMs. The LaserWriter Select 300 only uses 1 x 8 - 1MB and 4 x 8 - 4MB memory SIMMs.

LaserWriter Select 300 memory is NOT interchangeable with the LaserWriter Select 310, because their memory SIMMs are different size.

LaserWriter Select 300: PostScript Option (2/93)

Revised: 2/8/93
Security: Everyone

LaserWriter Select 300: PostScript Option (2/93)

==========

Article Created: 9 February 1993

TOPIC ----------

How do I add PostScript to a LaserWriter Select 300? What abilities do I gain or lose if I add PostScript?

DISCUSSION ----------

Adding PostScript

You can add PostScript to your LaserWriter Select 300 by installing the Apple LaserWriter Select 300 PostScript Option. This is a logic board exchange that effectively changes your printer to a LaserWriter Select 310.

Because some disassembly is required, this expansion kit must be installed by an authorized Apple dealer. If you want to keep both logic boards, and switch between them, you must have a dealer perform the logic board switch each time.

What You Gain, What You Lose

When you add the PostScript Option to a LaserWriter Select 300, you add the ability to print PostScript Level I documents, but you lose the FinePrint and PhotoGrade image enhancement technologies, as well as printer sharing.

Also, you cannot use memory from the original LaserWriter Select 300 logic board on the logic board contained in the PostScript Option, because the SIMMs are different sizes. If you wish to add printer memory when installing the PostScript Option, you must use the 1MB or 4MB 72-pin SIMMs for the LaserWriter Select 310.

LaserWriter Select 310: Grayscale Printing (2/93)

==========

Article Created: 9 February 1993

TOPIC ----------

How do I print grayscale images on the LaserWriter Select 310?

DISCUSSION ----------

The LaserWriter Select 310 prints dithered grayscale images using its PostScript Level I printer driver. The LaserWriter Select 310 with the PostScript driver can print up to 33 shades of gray.

To print documents in grayscale mode on the LaserWriter Select 310:

1) Open the Print dialog box and click on the Options button. This opens the Print Options dialog box.

2) Select the "Color/Grayscale" button under the "Print" setting.

LaserWriter Select 310: Connectivity (2/93)

Revised: 2/8/93
Security: Everyone

LaserWriter Select 310: Connectivity (2/93)

==========

Article Created: 9 February 1993

TOPIC ----------

This article describes the connectivity features of the LaserWriter Select 310.

DISCUSSION ----------

Overview

The LaserWriter Select 310 printer contains two communications ports:
• A serial port for Macintosh connectivity
• A Centronics parallel port for connection to MS/DOS and Windows computers.

Each of these ports is described below.

The printer has no LocalTalk port, and there is no support for AppleTalk.

Because the LaserWriter Select 310 supports only the PostScript printer description language, it does not support Hewlett Packard's Printer Control Language (PCL) and does not support automatic emulation switching.

The LaserWriter Select 310 is designed for use as a personal printer, so communications port switching is not supported and you cannot print to both ports at the same time. Both ports are active when the printer is powered up. The first port that receives a printing command from a connected computer becomes the active port. The other communications port is then inactive until the printer is restarted.

Serial Port

The LaserWriter Select 310's serial port is RS-232 compatible, runs at 57,600 bps with a DTR/DTS (hardware handshaking) protocol, and is designed

to be connected to a high speed Macintosh serial port. The serial port uses a mini-DIN 8 connector.

Centronics Parallel Port

The LaserWriter Select 310's Centronics parallel port is intended to be connected to a MS-DOS computer. The parallel port uses a 36-pin standard Centronics connector.

LaserWriter Select 310: Printer Drivers (2/95)

Revised: 2/20/95
Security: Everyone

LaserWriter Select 310: Printer Drivers (2/95)

==========

Article Created: 9 February 1993
Article Reviewed/Updated: 20 February 1995

TOPIC ----------

This article describes the printer drivers and operating-system compatibility of the LaserWriter Select 310.

DISCUSSION ----------

Operating System Support

The LaserWriter Select 310 includes both Macintosh and Microsoft Windows printer driver software.

The following operating systems are supported:
- Macintosh System Software 6.0.7 and 6.0.8
- Macintosh System Software 7.0 and later
- Microsoft Windows 3.0
- Microsoft Windows 3.1

Macintosh Software

The Macintosh LaserWriter driver has been modified to support the features of the LaserWriter Select 310: background printing, multiple paper sources, and the Print Density control. The modified printer driver is the LaserWriter Select 310 printer driver.

You can select background printing in the Chooser. Note that background printing uses your computer's processing power and may cause your computer to briefly slow down as your document prints.

With an option in the Print Dialog Box, you can now select which bin to print from. You can also print the first page of a document from one tray (for example, containing letterhead paper) and the rest of the document from a different tray (for example, containing plain paper).

The Options selection in the Print Dialog Box contains the Print Density control. The LaserWriter Select 310's print density can only be controlled by software; it has no hardware print density control.

Microsoft Windows

The Windows 3.0 and 3.1 drivers allow you to select printer resolution, paper handling and grayscaling options.

Article Change History:
20 Feb 1995 - Added additional information on printer driver.

LaserWriter Select 310: Memory Requirements (3/95)

Revised: 3/20/95
Security: Everyone

LaserWriter Select 310: Memory Requirements (3/95)

==========

Article Created: 9 February 1993
Article Reviewed/Updated: 20 March 1995

TOPIC

This article discusses the memory requirements and configurations of the LaserWriter Select 310.

DISCUSSION

Letter-Size Pages

The LaserWriter Select 310 ships with 1MB of ROM and 1.5MB RAM on the logic board. With this amount of memory, you can print letter-size pages and download up to three PostScript typefaces to the printer.

Legal-Size Pages

If you want to print legal-size documents, download additional Postscript fonts, or print documents with complex graphics then you must install either the 1MB or 4MB memory upgrade. If you print a legal-size page from the multi-purpose tray without upgrading the memory, your page prints on the legal paper, however on in a letter-size page area (8.5x11).

Possible Memory Configurations

Built-in	Expansion	Total Memory
1.5MB	0	1.5MB
1.5MB	1MB	2.5MB (required for legal-size paper)
1.5MB	4MB	5.5MB (maximum amount)

The LaserWriter Select 310 has one memory expansion DRAM SIMM slot that uses industry-standard fast page mode 100ns 72-pin memory SIMMs. Only 1MB and 4MB SIMMs are supported in the LaserWriter Select 310.

The LaserWriter Select 310 memory is NOT interchangeable with the LaserWriter Select 300, because their SIMMs are different sizes.

Article Change History:

LaserWriter Select 300: Printing Process (2/93)

Revised: 2/8/93
Security: Everyone

LaserWriter Select 300: Printing Process (2/93)

==========

Article Created: 9 February 1993

TOPIC ----------

This article describes the printing process used by the LaserWriter Select 300.

DISCUSSION ----------

While other Apple laser printers image document pages directly into the printer's internal memory, the LaserWriter Select 300 performs most of its printing process in the host computer's printer driver.

The LaserWriter Select 300 print process begins when a page is converted into two files: the object file and the index file. The object file contains descriptions of all the objects on the page, and the index file contains information on where each of the objects belong on the page.

The printer driver then allocates memory inside the Macintosh to hold a portion, or band, of the page that is being printed. This memory is called a band buffer. (The size of the band buffer depends on how much memory is available; it can be as small as 4KB for a portrait page, or 9KB for a landscape page.) The objects are then imaged into the band buffer one scan line at a time until the buffer is full.

Any objects that extend beyond the number of scan lines that the band buffer can hold are clipped. When the buffer is full, the driver compresses the data in the buffer with an Apple proprietary compression scheme and sends the band to the printer. This compression scheme processes data with no loss of information and is tuned for high-resolution images.

The printer places the compressed data into its internal buffer and then waits for the next band. When all the bands for a page have been sent to the LaserWriter Select 300, the driver instructs the LaserWriter Select 300

to begin printing the page. The printer then begins decompressing the data and imaging the scan lines to the print engine.

Because much of the printer intelligence is located in custom ASICs and the LaserWriter Select 300 driver, the LaserWriter Select 300 logic board is much simpler and smaller than that of the LaserWriter Select 310. The LaserWriter Select 300 also needs less on-board RAM (only 512KB) due to the data compression techniques employed by the driver.

LaserWriter Select 310: Description (1/94)

==========

Article Created: 9 February 1993
Article Reviewed/Updated: 10 January 1994

TOPIC ----------

This article describes the LaserWriter Select 310.

DISCUSSION ----------

Overview

The LaserWriter Select 310 is the most affordable PostScript laser printer ever to come from Apple, and is designed for personal use by both Macintosh and Windows computer users.

13 scalable Postscript fonts are provided, including such popular standards as Times, Helvetica, and Courier.

Background printing is included for both Macintosh and Windows computers.

The LaserWriter Select 310 features a standard cassette tray that holds 250 sheets of paper, and a manual paper feed tray. You can add an optional 250- or 500-sheet paper feeder, a 250-sheet legal cassette, an envelope cassette, and a multipurpose tray for paper or envelopes.

Serial and parallel connections are included so there's no need to purchase any additional interface cards or software drivers.

Print quality

• 300 dots-per-inch (dpi) resolution for high-quality text and graphics
• 13 scalable fonts for printing a wide range of styles and sizes
• Adobe PostScript printing

Compatibility

- Perfect for Macintosh or Windows computing environments
- Adobe PostScript

Versatility

- 250-sheet automatic tray and manual feed tray included
- Optional paper-handling capabilities for up to 800 sheets of paper (includes different media)
- Compact design fits any desktop

TOPIC ----------

This article provides technical specifications for the LaserWriter Select 310.

DISCUSSION ----------

Marking Engine

- Fuji Xerox laser

Print Quality

- 300 dpi for text and graphics

Controller

- AMD Am29205 RISC processor

Memory

- 1.5MB of RAM, expandable to 5.5MB
- Optional 1MB and 4MB upgrades

Speed

- Five pages-per-minute maximum (actual speed varies depending on images printed and computer used)

Interfaces

- Serial 8-pin DIN port
- Parallel port

System Requirements

- Any Macintosh running System 6.0.7 (with TrueType INIT) or later, or any version of System 7
- Any personal computer running Windows
- DOS applications with a PostScript driver

Fonts

- 13 fonts from the following families: Courier, Helvetica, Times, and Symbol
- Any PostScript font

Recommended Duty Cycle

- Minimum life expectancy: 150,000 pages
- Toner cartridge: 4,000 pages at 5% density

Paper Capacities

Standard
  — Manual feed tray
  — 250-sheet feeder
Optional
  — 250- or 500-sheet feeder
  — 50-sheet multipurpose tray (also holds up to five envelopes)

Paper Sizes

Width:	Minimum - 97mm	(3.82 in)	Maximum - 216mm	(8.5 in)
Length:	Minimum - 148mm	(5.83 in)	Maximum - 356mm	(14.0 in)

Printable Area

- Maximum printable line: 8.0 in (203.2 mm)
- Minimum top, bottom, left, and right margins: 0.25 in. (6.35 mm)

Print Materials

- 16lb to 36lb. (60 to 135 g/m2) bond via manual feed
- Paper: U.S. letter, U.S. legal, A4, executive and legal
- Most letterhead and colored stock, labels, and envelopes
- Medium-weight photocopier transparencies

Size and Weight

- Height: 8 in. (25.3 cm)
- Width: 15 in. (38 cm)
- Depth: 18.3 in. (45 cm)
- Weight: 26 lb. (12 kg)

Operating Environment

- Temperature: 50 to 90° F (10 to 32° C)
- Humidity: 20% to 80% noncondensing
- Toner cartridge transit environment: –4 to 104° F (–20 to 40° C)

Power Requirements

- U.S./Japan: 100 to 115 V, 50 to 60 Hz
- Europe/Australia: 220 to 240 V, 50 Hz

Power Consumption

- 450 W maximum at 115 V or 220 V

Article Change History:
20 Mar 1995 - Added paper sizes
12 Apr 1994 - Revised maximum paper weights
21 Mar 1994 - Correct metric paper weights

PowerBook Duo 230 with Express Modem (2/93)

Revised: 5/31/94
Security: Everyone

PowerBook Duo 230 with Express Modem (2/93)

==========

Article Created: 9 February 1993

TOPIC ----------

This article describes a new PowerBook Duo 230 configuration with built-in Express Modem.

DISCUSSION ----------

This new product adds a high-end configuration to the line of PowerBook Duo notebook computers. It includes 4MB of RAM (expandable to 24MB), a 120MB hard drive, and the Express Modem.

The internal PowerBook Express Modem provides:
- 14,400bps data send/receive
- 9,600 fax send/receive
- support for V.42bis data compression, which results in an effective data throughput of up to 57,600bps.

Note: bps = bits per second, or Baud.

QuickDraw LaserWriters: Printer Sharing (6/96)

Revised: 6/24/96
Security: Everyone

QuickDraw LaserWriters: Printer Sharing (6/96)

==========

Article Created: 9 February 1993
Article Reviewed/Updated: 24 June 1996

TOPIC ----------

This discussion focuses on sharing the LaserWriter Select 300, Personal LaserWriter 300, or the LaserWriter LS printers over a network. To share one of these printers, you must use the LaserWriter 300 printer software.

DISCUSSION ----------

You must use the LaserWriter 300 printer driver (which includes GrayShare), to share your LaserWriter printer with up to 21 additional computers over an AppleTalk network. There is no limit on how many people choose the printer in the Chooser, but only 21 people can simultaneously print to the printer. Anyone who wants to print to the shared printer needs to install the LaserWriter Select 300 printer driver. To print to a networked printer from a Macintosh using System 6, you must have System 6.0.7 or 6.0.8 installed, and use MultiFinder.

You still retain control of the printer after sharing it because the LaserWriter is connected to your computer. You can turn sharing on or off at any time. You can also use the Print Monitor program to view a list of pending print jobs and delete any jobs from that list.

Your Macintosh connected to the shared LaserWriter slows down when other users print to the shared printer because the computer is actually being used as a spooler. The information is sent from the remote computer to yours, then from your computer to the printer.

Sharing a Printer

To share a LaserWriter Select 300, Personal LaserWriter 300, or LaserWriter LS with other users, follow these steps:

Step 1:
To share a printer, you must be connected to an AppleTalk network of some type.

LocalTalk Connection

The LocalTalk connector goes into the printer port. The peripheral 8 cable (serial cable) connects the printer to the Macintosh. It needs to go into the modem port.

Ethernet or Token Ring Connection

Since both Ethernet and Token Ring connections do not require you to use a serial port. You can use either the printer or modem port to connect the printer to your Macintosh.

Step 2:
Open the Chooser and select the LaserWriter icon. A list of available printers is displayed.

Step 3:
Click the icon of the port to which your printer is connected. (If you are using the printer port to connect your Macintosh to the network, you must connect your LaserWriter to the modem port.)

Step 4:
Make sure Background Printing is On.

Step 5:
Click the Setup button to open the LaserWriter Sharing Setup dialog box.

Step 6:
Place an X in the Share this Printer checkbox. You may choose to name your printer and to enter a password.

If you type a password for the printer, only users who know the password can use the printer from their computers.

If you want a record of what is printed on your printer, place an X in the Keep Log of Printer Usage checkbox.

Step 7:
Click OK to close the LaserWriter Sharing Setup dialog box and close the Chooser window.

Your LaserWriter is now available to other users on the network.

Printing to a Shared Printer
==========

To print to a shared LaserWriter Select 300, Personal LaserWriter 300, or LaserWriter LS follow these steps:

Step 1:
Open the Chooser and select the LaserWriter 300 icon. A list of available communications ports and printers is displayed.

Step 2:
Click the name of the shared LaserWriter you want to use. If the printer requires a password, a dialog box appears; type in the password.

Step 3:
You may click the Get Info button to see whether any fonts in your system are unavailable on the shared printer. If your documents use such fonts, printing is slower, because the fonts must be downloaded to the printer.

Step 4:
Close the Chooser.

You are now ready to print to the shared LaserWriter Select 300.

Article Change History:
24 Jun 1996 - Added turn Background Printing on.
21 Feb 1995 - Added keyword; made several technical updates.
12 Dec 1994 - Added System 6 information.

LaserWriter Select: Paper Handling (2/93)

Revised: 4/13/93
Security: Everyone

LaserWriter Select: Paper Handling (2/93)

==========

Article Created: 9 February 1993

Article Change History

04/13/93 - UPDATED
• To clarify the LaserWriter Select's envelope capacity

TOPIC ----------

This article describes the paper handling features of the LaserWriter Select 300 and 310.

DISCUSSION ----------

The LaserWriter Select 300 and 310 printers include, as standard equipment, a 250-page paper cassette and manual paper feed tray to provide flexible paper handling.

Other paper handling options are:
• 50-sheet multipurpose tray (with 5 envelope capacity)
• 250-sheet legal cassette
• 250-sheet and 500-sheet feeders
• Envelope cassette (with 30 envelope capacity)

A LaserWriter Select 300 or 310 equipped with both a 500-page sheet feeder and a 50-sheet multipurpose tray, as well as its standard 250-sheet cassette, can contain up to 800 sheets of paper at one time.

Note that the LaserWriter Select 300 and 310's output tray holds only 150 sheets. If a large print job is sent to the printer, the output tray will need to be emptied more frequently than the input trays need to be filled.

Avoid feeding transparencies or envelopes into your LaserWriter Select 300 or 310 from regular paper cassettes, because they may jam in the printer. You should feed transparencies from the multipurpose or manual feed trays.

Use the envelope cassette and multipurpose or manual feed trays to feed envelopes.

Media Sizes

The LaserWriter Select printers can accommodate Letter, A4, B5, Legal, and Envelope size media. The table below shows what size of media is handled by the various feeders.

Feeder	Media Size
Standard paper cassette (built-in)	Letter, A4, B5, Executive
Manual feed tray (built-in)	Letter, A4, B5, Executive, Legal, Envelope
Multipurpose tray	Letter, A4, B5, Executive, Legal, Envelope
250-sheet legal cassette	Letter, A4, B5, Legal
250-sheet cassette feeder	Letter, A4, B5
500-sheet cassette feeder	Letter, A4, B5
Envelope cassette	Envelope Width 100 - 162 mm (3.94- 6.38 in.) Envelope Length 148 - 241.3 mm (5.83 - 9.5 in.)

LaserWriter Select 300: Setting and Changing the Password (2/93)

Revised: 2/8/93
Security: Everyone

LaserWriter Select 300: Setting and Changing the Password (2/93)

==========

Article Created: 9 February 1993

TOPIC ----------

This article describes the use of passwords on a LaserWriter Select 300 equipped with GrayShare software.

DISCUSSION ----------

Overview

In the context of sharing a LaserWriter Select 300 on a network, the "owner" of the LaserWriter Select 300 is the person who has attached a LaserWriter Select 300 to his or her Macintosh.

GrayShare software lets the owner of a LaserWriter Select 300 "share" the printer over a network, and allows the owner to control access to the shared LaserWriter Select 300 by setting a password. If the owner sets a password, only those users who know the password can print to the shared LaserWriter Select 300. If the owner does not set a password, anyone can print to the shared LaserWriter Select 300.

The password remains in effect until the printer is renamed, the password is changed, or the user selects another LaserWriter Select 300. For security purposes, the password is always displayed as five bullet characters (•••••).

To set a password, share the LaserWriter Select 300 on the network, then type a password in the Password field of the Sharing Setup menu.

Changing the Password

If the owner changes the password for a shared LaserWriter Select 300, and you print without entering the new password, a dialog box appears stating

"The password has been changed. Use the Chooser to select the printer again".

When you open the Chooser and select the LaserWriter Select 300 icon, the printer you were using is highlighted. However, no dialog appears asking you to re-enter the password until you either click the "Get Info" button, double click the selected printer or choose another shared LaserWriter Select 300.

A/UX 3.0: libPW.a and Missing Error Symbol (2/93)

Revised: 2/16/93
Security: Everyone

A/UX 3.0: libPW.a and Missing Error Symbol (2/93)

==========

Article Created: 5 February 1993

TOPIC ----------

I am trying to compile a C application that is using a standard library, included in A/UX 3.0, called libPW.a. I can't find in the library the symbol called Error. Is it missing?

If the Error symbol isn't missing, where is it? Any ideas to compile my application correctly?

DISCUSSION ----------

We have searched in the libPW.a library: the 'Error' symbol is referenced by the modules xcreat.o, xlink.o, xmsg.o, and xopen.o that are defined in the libPW.a archived library. Try 'nm /lib/libPW.a | more'. You'll find where the 'Error' is located.

In order to call any function included in the libPW.a library, besides including the -lPW option to the compiler, make sure that the header file called macros.h in /usr/include is included in the user's program (with the line of #include <macros.h>). The external Error symbol is declared in macros.h.

TrueType: Fonts Incompatible with MacWrite II 1.1v4 and Earlier

Revised: 2/8/93
Security: Everyone

TrueType: Fonts Incompatible with MacWrite II 1.1v4 and Earlier

==========

Article Created: 8 February 1993

TOPIC ----------

Claris sent this list of fonts that can cause problems with MacWrite II 1.1v4 and earlier versions.

DISCUSSION ----------

Apple Font Pack Problems - "Font not Installed" Message

We have confirmed a problem with MacWrite II 1.1v4 and earlier, combined with System 7.0.1 or 7.1 and the Apple TrueType Font Pack:

If you use System 6 (with TrueType installed), 7.0.1 or 7.1, and have any of the following fonts installed, you may receive the "this document uses a font that is not installed, possibly XXX" message. The fonts that we have identified are as follows:

- Garamond Narrow
- Helvetica Black
- Helvetica Compressed
- Lubalin Graph
- Nadianne
- Swing

After the message appears, the document will open in the Chicago font.

Correcting the Problem

You have a variety of options:

- Remove the fonts from the Font Folder.
- Use Find/Change on Attributes to change the font from Chicago to the

desired font.

You will continue to get this message until you remove the fonts.

NOTE: MacWrite II 1.1v4 was an in-line revision only. MacWrite Pro doesn't have this problem .

Article Reviewed/Updated: 7 November 1995

TOPIC ----------

This article describes system requirements of the LaserWriter Select 310.

DISCUSSION ----------

System Requirements
==========
The LaserWriter Select 310 requires either:

Macintosh

A Macintosh computer with 1MB of memory, a hard disk, and System 7.0 or greater.

- System 7.5 users may need to do a custom install of the software.

- System 7.5.2 users will need to downloaded the LaserWriter Select 310 v7.0.1 driver from Apple Software Updates.

- Macintosh Centris 660AV, Quadra 660AV, Qudra 840AV users should use Enabler 088 v1.2, available in Software Update 3.0, or upgrade to System 7.5 or 7.5.1.

Windows

An Intel-standard personal computer with Microsoft Windows 3.0 or later.

Fonts
=====
The LaserWriter Select 310 can use Adobe Type 1 or bitmap fonts. TrueType fonts will either be printed as bitmaps (if no Type 1 equivalent exists in the

printer's ROMs) or as an unhinted Type 1 equivalent.

Article Change History:

PowerBook 165c: No 160MB Hard Drive at Introduction (2/93)

Revised: 5/31/94
Security: Everyone

PowerBook 165c: No 160MB Hard Drive at Introduction (2/93)

==========

Article Created: 9 February 1993

TOPIC -----

I thought Apple was planning to offer a 160MB hard drive on the PowerBook 165c. That's what the datasheet says.

DISCUSSION -----

The datasheet is incorrect. In the future, Apple may offer a 160MB hard drive option in the PowerBook 165c, but at the time of the new model's introduction, the largest-capacity available hard drive is 120MB.

Macintosh: Mapping Russian Cyrillic Letters from PC (3/93)

Revised: 3/3/93
Security: Everyone

Macintosh: Mapping Russian Cyrillic Letters from PC (3/93)

==========

Article Created: 3 March 1993

TOPIC ----------

I run a BBS on FIDO NET at school, and one of the primary uses is to communicate with Russia via E-Mail. All of the systems in Russia are running on IBMs or compatibles. In order to transmit messages in Russian, they have used the High Bit ASCII code and put the Cyrillic alphabet there. I have a clone connecting to Russia, and from it I can read, write, and send messages in Russian.

Most of our students access the BBS from Macintosh computers in our computer center or from home; the Macintosh computers can neither read nor write messages in Russian. That which is High ASCII Russian on the clone, is High ASCII garbage on the Macintosh. Surely there must be a way to access the High Bit code on the Macintosh, place Cyrillic letters there, and then have a simple toggle to switch to and from High ASCII.

DISCUSSION ----------

By "High Bit code," we are assuming that the Cyrillic characters are placed in locations 128 to 255 in the ASCII range on the PC. Well, the limiting factor here is really character mapping -- how to get the specific character mapping on the PC translated into a special character mapping on the Macintosh.

One possible solution would be to get the exact character map used on the PC, and then create or modify an existing Macintosh font to have the same characters and mapping. You'd have to verify how those characters map to the keyboard on the Macintosh to write Russian back. (Note: the Option key will most likely be used in conjunction with another key in order to access most of the "High Bit" ASCII characters). Making this all work wouldn't be very easy, and would require use of tools like Fontographer and ResEdit to modify the FONT and KCHR resources.

LaserWriter: How to Print 21 cpi When Using PCL (3/93)

Revised: 3/24/93
Security: Everyone

LaserWriter: How to Print 21 cpi When Using PCL (3/93)

==========

Article Created: 15 February 1993

TOPIC ----------

How can I print 21 characters per inch (cpi) to my Apple LaserWriter while using HP's Printer Control Language (PCL)?

DISCUSSION ----------

You must first put your PCL-compatible LaserWriter into PCL emulation mode and then send your LaserWriter the appropriate control code. The LaserWriter IIf and IIg, LaserWriter Pro 600 and 630, and Personal LaserWriter NTR are PCL-compatible.

There are two ways of putting your LaserWriter into PCL emulation mode:
• Set your printer to PCL emulation mode.
• Invoke the PCL emulator from PostScript.

Set Your Printer to PCL Emulation Mode

To set your LaserWriter to PCL emulation mode, put the rotary thumbwheel switch on the printer to the position for HP LaserJet Plus emulation. This position varies among the different LaserWriter printers. Until your LaserWriter is switched to a different setting, all input will be treated as PCL input. You must also choose a printer driver in your software that is configured for a HP LaserJet IIP (this driver is often shipped with MS-DOS, Windows, or the PCL-compatible application).

Invoke the PCL Emulator from PostScript

Invoking the PCL emulator within a PostScript program makes it easier to switch between PostScript files and other printer language emulators. You invoke a particular printer emulation inside a PostScript language program with

a 'statusdict' procedure called 'emulate'. The PostScript command string to invoke PCL is:

```
statusdict begin currentfile /hpcl emulate
```

The control code for the pitch or characters per inch (cpi) selection is:

```
ESC(s#H
```

where the # is the pitch or cpi. Note that the pitch setting doesn't apply to proportional fonts, since the number of characters printed in an inch of proportional type varies, depending on which letters are printed.

The control code for 21 cpi printing is:

```
ESC(s21H
```

If you are already in PCL emulation mode, you can simply send this control code to the printer through your application program.

If you want to invoke PCL emulation mode from PostScript and start 21 cpi printing, type this command string

```
statusdict begin currentfile /hpcl emulate ESC(s21H
```

into a text editor and save it as a text file. Then, launch the LaserWriter Utility and select the 'Download PostScript file' option from the Utilities menu. Download the text file you have saved and your LaserWriter will be able to print 21 cpi in PCL emulation mode.

Macintosh PC Exchange: Manual Correction (2/93)

Revised: 2/16/93
Security: Everyone

Macintosh PC Exchange: Manual Correction (2/93)

==========

Article Created: 9 February 1993

TOPIC ----------

Page 14 of the Macintosh PC Exchange manual states that you can create a mapping for a DOS file with "no suffix". However, if you try to do this, you get the message "To complete the assignment, the DOS suffix must be specified". Is the manual incorrect?

DISCUSSION ----------

The Macintosh PC Exchange manual is incorrect: it is not possible to create a mapping for a DOS file without the three-character extension, referred to in the Macintosh PC Exchange manual as a "suffix".

Apple Internet Router: AURP Q&A (2/93)

Revised: 2/16/93
Security: Everyone

Apple Internet Router: AURP Q&A (2/93)

==========

Article Created: 8 February 1993

TOPIC ----------

This article answers questions that relate to Apple Internet Router and AURP.

DISCUSSION ----------

Q: What exactly is AURP?
A: AURP (AppleTalk Update-based Routing Protocol) specifies a standard way of connecting AppleTalk networks over point-to-point lines such as dialup modems and T-1 lines and of tunneling AppleTalk through foreign network systems, such as TCP/IP, X.25, OSI and DECnet. It was designed to improve AppleTalk for use on wide-area networks, including telecommunication links and campus-like backbone networks. It is an enhancement to the AppleTalk architecture that improves the efficiency and scalability of large AppleTalk internets, allowing users to easily interconnect remote Macintosh and PC workgroups.

Q: How does AURP reduce network traffic?
A: AURP provides for efficient routing over point-to-point lines or multipoint connections. As its name implies, AURP updates routing tables only when a change occurs in the network and does so by transmitting only the changed information, thereby greatly reducing traffic.

Q: Are AURP specifications publicly available?
A: Yes. Specifications have been distributed publicly at the Interop Trade shows and will be available through APDA (Apple's source for developer tools), and through the internet as an information RFC (Request for Comment).

Q: Are there other products available that implement AURP?
A: Various third parties have demonstrated functioning versions of AURP at

Interop in 1992. We cannot discuss unannounced products by any of the third parties.

Q: Was AURP developed as a replacement routing protocol for RTMP?
A: No. AURP was developed to complement the AppleTalk RTMP (Routing Table Maintenance Protocol). RTMP was primarily designed for LANs, while AURP was specifically designed to complement RTMP by providing wide-area capabilities.

Q: Why didn't Apple wait for the standards groups to set an AURP standard?
A: Our customers clearly indicated the need for an AURP-type solution as soon as possible. While Apple fully supports working with standards groups, such as the IETF, doing so greatly delays a product's time to market, often by several years. In order to supply customers with a timely solution, we choose to implement AURP in the Apple Internet Router product family.

Q: What is Apple doing to get AURP adopted as an industry standard?
A: Apple is presently evangelizing AURP, touting its performance and flexibility to customers, third party vendors and standards groups, such as the AppleTalk Network Forum (ANF) and the IETF.

Q: Are you working with the IETF?
A: Yes. We continue to work with the IETF on many issues, such as network management and AppleTalk over PPP (Point-to-Point protocol). We will also be publishing the AURP specification as an informational RFC (Request for Comment).

Apple Internet Router: General Q&A (2/93)

Revised: 2/16/93
Security: Everyone

Apple Internet Router: General Q&A (2/93)

==========

Article Created: 8 February 1993

TOPIC ----------

This article contains Apple Internet Router product related Questions and Answers.

DISCUSSION ----------

Q: What did Apple introduce at Networld in Boston this January?
A: Apple introduced the Apple Internet Router product family. The new product line allows local and remote Macintosh computers or PC workgroups to easily interconnect. The new router software allows organizations to increase the size, performance, and manageability of their AppleTalk networks. It is also Apple's first implementation of the AppleTalk Update-based Routing Protocol (AURP), a new technology that significantly reduces network traffic over an internet.

Q: What is a router?
A: Routers are devices that can connect multiple networks, providing for two or more connections. Routers operate at Level 3 (network) of the ISO OSI model and are protocol sensitive, allowing a router to send data packets along alternate paths and "intelligently" decide how to best route data packets. Routers send data along the best available path based on traffic levels, availability, and the general status of wide-area connections.

Q: What are the products that make up this family?
A: Apple is introducing three Apple Internet Router products: a base routing software kit and two extension kits. The Basic Connectivity Package provides the core routing software and technology. Apple's two extension packages—the AppleTalk/IP Wide Area Extension and the AppleTalk/X.25 Wide Area Extension—provide wide area AppleTalk routing over TCP/IP and X.25 networks, respectively. The extension kits are

sold separately.

Q: Why is the AppleTalk/X25 Wide Area Extension product so much more expensive than the other router family products?
A: The AppleTalk/X25 Wide Area Extension product includes Router X.25 software and installer in addition to Apple's MacX25 server software. The price is derived from the combined cost of the router X.25 software and the MacX25 sever software.

Q: Do you need to purchase the Basic Connectivity Package in order to use Apple's X.25 or TCP/IP extension packages as well as other third-party extension products?
A: Yes. The Basic Connectivity Package provides the core routing software and technology on which the extension products build.

Q: How can I get more information or place an order?
A: These products will be available worldwide from Apple authorized resellers and in the United States: call The Apple Catalog at 1-800-795-1000.

Q: How does the new internet router product family differ from Apple's current internet router -- the AppleTalk Internet Router 2.0?
A: The new router is a completely redesigned product with many capabilities beyond the 2.0 router, while still providing all the functionality of the 2.0 router. The new router provides both wide-area and local-area networking. Superior WAN connectivity is made possible by implementing a new technology -- called the AppleTalk Update-based Routing Protocol (AURP) -- which significantly reduces network traffic. It also provides support for the Simple Network Management Protocol (SNMP). The new router software also provides enhanced LAN support, routing data between industry standard LocalTalk, Ethernet, Token-Ring, and other network types.

Q: Will the AppleTalk Internet Router 2.0 still be available after the new router products begin shipping?
A: No. The new Apple Internet Router product family replaces Apple's current router, the AppleTalk Internet Router 2.0.

Q: Is Apple providing upgrades for AppleTalk Internet Router 2.0 users?
A: Yes. Apple will provide software upgrades until June 12, 1993, with proof of purchase.

Q: What network types does the Apple Internet Router work on?
A: The Basic Connectivity package ships with support for AppleTalk over LocalTalk, Ethernet, and Token Ring networks, and (using AURP) over dial-up modems. The AppleTalk/IP extension ships with support for AppleTalk "tunneling" through TCP/IP (using AURP) over either Ethernet or Token Ring, and the AppleTalk/X.25 extensions supports X.25 over Apple's Serial/NB card. Third parties will be adding support for many other network types, such as FDDI and SMDS.

Q: Who are the third parties building extensions for the new router product family?

A: There are a variety of third-party companies building extensions for the Apple Internet Router product family, including Asante, Farallon Computing, Insignia, MultiAccess Computing, Neon Software, and Cabletron. There are also many companies that have not yet announced support for AURP, but are expected to do so in the near future. For detailed information of current solutions, see the Apple Internet Router Solutions Guide.

Q: What security features does it have?
A: The new router includes security options to protect networks from unauthorized use, including a router setup password, half-routing password/callback, and the device hiding and network number hiding features of AURP.

Q: What monitor and control features does it offer?
A: The new router has built-in SNMP (Simple Network Management Protocol) support which enables the router to be monitored from any SNMP-based network management console. It also provides a router log and reports network statistics.

Q: What is the significance of providing built-in support for SNMP?
A: SNMP is a widely-adopted industry standard for network management, which Apple has adopted as the core part of its network management strategy. Through SNMP, the setup and operation of the router can be monitored through any number of currently available third-party SNMP consoles. Use of SNMP also demonstrates Apple's continued commitment to standards.

Q: How do the new router products enhance local area connectivity?
A: The Apple Internet router can interconnect all types of AppleTalk networks, including LocalTalk, Ethernet, and Token Ring. This offers greater flexibility in choosing network media and topologies.

Q: What are the operating requirements of the software?
A: The Apple Internet Router software operates on all Macintosh computers with at least 4MB of memory, and System 7.0 or later. The software was designed for AppleTalk Phase 2 networks only.

Apple Internet Router: Strategy Q&A (2/93)

Revised: 2/16/93
Security: Everyone

Apple Internet Router: Strategy Q&A (2/93)

==========

Article Created: 8 February 1993

TOPIC ----------

This article answers questions about the router strategy surrounding Apple Internet Router.

DISCUSSION ----------

Q: Who are the companies that Apple competes with in the router market?
A: Apple's key competitors are Cisco Systems, Novell, Shiva, and Cayman Systems.

Q: How is Apple's router product family differentiated from the competition?
A: The Apple Internet Router Product Family is clearly the easiest to use solution for connecting small and medium AppleTalk workgroups, via either a LAN or a WAN, over diverse media types. Also, the Apple Internet Router is currently the only one that supports AURP and its many features such as network number remapping and hop count reduction.

Q: Why hasn't Apple provided multiprotocol routing with its newest router?
A: Our customers clearly indicated the need for an AURP-type solution. While Apple understands the value of multiprotocol support in its router, such development would have taken much longer to bring to market. Our priority was to meet our customers' needs as quickly as possible.

Q: Will Apple provide additional Internet extension products in the future?
A: It is Apple's policy to not discuss future product directions due to the competitive nature of the technology marketplace. However, Apple is always evaluating new technologies and new solutions that may one day make life even easier for our customers.

Q: Why is Apple providing a new family of internet router products?
A: Apple's original router solution—the AppleTalk Internet Router 2.0—was best suited as a solution for interconnecting LANs. The Apple Internet Router provides a good solution for interconnecting both local and remote workgroups.

Q: Does Apple intend to introduce router hardware products in the future?
A: It is Apple's policy to not discuss future product directions due to the competitive nature of the technology marketplace.

Q: What is the installed base of AppleTalk Internet Router 2.0 users?
A: IDC estimates an installed base of approximately 20,000 AppleTalk Internet Routers.

Q: What market share does the outgoing AppleTalk Internet Router 2.0 currently have?
A: IDC estimates Apple's 1992 share of the router market to be about 18 percent.

Apple Internet Router: Technical Q&A (2/93)

Revised: 2/16/93
Security: Everyone

Apple Internet Router: Technical Q&A (2/93)

==========

Article Created: 8 February 1993

TOPIC ----------

This article answers technical questions about Apple Internet Router.

DISCUSSION ----------

Q: Does the Macintosh running the Apple Internet Router software have to be dedicated to routing only?
A: No. The Apple Internet Router operates in the background and allows the Macintosh to be used for other foreground applications. Though the router can be run in the background of a user's workstation, it creates the potential to disrupt the integrity of the internet if the user crashes an application or turns off the Macintosh. A more secure internet can be created by running the router in the background of other Apple server products such as the AppleShare Server and Apple SNA•ps Gateway software. The Apple Internet Router should be run by itself for optimum performance on large internets.

Q: How many physical ports available can be interconnected with a single Apple Internet Router?
A: Up to 32 physical ports are available on the Apple Internet Router.

Q: Does the Apple Internet Router support remote administration?
A: The Apple Internet Router supports network management through the industry-standard Simple Network Management Protocol (SNMP). By using the Timbuktu product form Farallon, which is detailed in the Apple Internet Router Solutions Guide, users can remotely administer the Apple Internet Router.

Q: How many virtual circuits can the AppleTalk/X25 Wide Area Extension support?
A: The X25 can support eight virtual circuits per Apple Serial NB Card for a

total of up to 32 virtual circuits.

Q: Can the AppleTalk/IP Wide Area Extension run over Ethernet and Token Ring?
A: Yes.

Q: Does the SNMP router agent in the Apple Internet Router support SNMP sets?
A: Currently the SNMP agent only supports GETS, which allows any SNMP-based management console to manage the router. However, the IETF is in the process of defining SNMP sets and Apple will support these specifications when they are finalized.

Q: What kind of performance can we expect to see with the Apple Internet Router?
A: Apple does not discuss performance ratings of its products because such figures are often misleading.

PowerBook/DOS Companion: Specifications

Revised: 2/12/93
Security: Everyone

PowerBook/DOS Companion: Specifications

==========

Article Created: 9 February 1993

TOPIC ----------

This article describes the products that make up the PowerBook/DOS Companion.

DISCUSSION ----------

MacLinkPlus/PC from DataViz

- Handles file translations and transfers from DOS and Windows to Macintosh
- Works with more than 700 of the most popular word processing, graphics, spreadsheet, and database programs
- Includes direct connect cable
- MacLinkPlus/PC will translate between these Macintosh word processing file formats:

  FrameMaker
  MacWrite
  MacWrite II
  Word
  WordPerfect
  Works WP (Mac and Apple II)
  WriteNow

- MacLinkPlus/PC will translate between these DOS and Windows program file formats:

  Ami Pro
  DCA-RFT

FrameMaker
MultiMate
OfficeWriter
Professional Write
RTF
Text
Word PC
Word for Windows
WordPerfect
WordStar
XYWrite

- MacLinkPlus/PC will translate between these spreadsheet file formats:

  Comma Values
  dBase
  Excel
  Lotus 123
  Symphony
  Multiplan
  SYLK
  Tab Text
  Tab Values
  Works DB and SS (Mac and Apple II)

- MacLinkPlus/PC translates between these graphics file formats:

  PICT
  AutoCAD (DXF)
  Harvard Graphics (CGM)
  Lotus Freelance (CGM)
  Lotus (PIC)
  PC PaintBrush (PCX)
  Ventura Publisher (IMG and GEM)
  Windows Bitmap (BMP)
  WordPerfect (WPG)

- MacLink/PC can transfer the following file formats from one platform to another:

  EPS
  PageMaker
  TIFF
  Binary

Macintosh PC Exchange software from Apple

- Recognizes MS-DOS, Windows, and OS/2 disks

MacVGA Video Adapter from James Engineering

- Video Cable

- Supports most VGA and SVGA monitors to display work in 256 colors

- Works with PowerBook 160 and 180, and with PowerBook Duo 210 and 230 connected to a Macintosh Duo MiniDock

- VGA and SVGA monitors supported:

  Aamazing 8431x, 8429 SE, 8489 GX
  CTX CM3436, CVT5488NI
  Compaq (except original)
  Dukane 28A-800 projection panel
  Goldstar 1430, 1450, 1480, 3031
  Hyundai HCM-421E, HCM423E
  IBM (except 8513)
  Leading Technology 500V, 1441V
  Matsushita ViewSonic 4, 5
  Nanao FlexScan 9070U
  NEC MultiSync 2A, 3D, 4D, 5D, GS-2A (grey)
  Northman MultiVGA 3D
  nView ViewImage II+2 projection panel
  Packard Bell PB8509 V, PB8528 SVG
  Panasonic Pansync 1381
  Power II CM1414E
  Qume 835
  Relisys RE-9513
  Samtron SC428V, SC428VS
  Seiko CM1440, CM1445, CM1450
  Sony CDP-1302, 1304, 1320
  Telex Magnabyte LCD projection panel
  Wang 1414
  Win Technologies SVGA
  Wyse Technologies WY-655
  Zenith CM1492

- Monitors not supported:

  AT&T CRD339D
  Compaq (original)
  Cordata CMC1412A
  Hyundai 402C
  IBM 8513
  Mag Computronic PMV14VC Plus
  Magnavox Professional Series
  Matsushita ViewPerfect 2v
  Packard Bell 8541 VGG
  Power II 3E
  Princeton UltraSync
  ProImage 7033
  Quadrant QC-1578
  Samsung Multisync (SVGA) 3E

PowerPrint from GDT Softworks

- Supports print drivers for more than 1000 printers

- Includes serial-to-parallel cable

- Supports any printer compatible with the following Hewlett-Packard printers:

  HP DeskJet
  HP DeskJet 500
  HP ThinkJet
  HP LaserJet
  HP LaserJet Plus
  HP LaserJet II, IIP, and III

- Supports any printer compatible with:

  Epson LQ
  Epson FX
  Canon BJ-330
  Canon LBP
  Canon BJ-10ex
  Canon BJ-1130

- Supports any printer compatible with Toshiba printers.

- Supports any printer compatible with the NEC Pinwriter

DAL: Using CL/1 XCMDS (2/93)

Revised: 2/16/93
Security: Everyone

DAL: Using CL/1 XCMDS (2/93)

==========

Article Created: 9 February 1993

TOPIC ----------

I'm using the CL1-etc. XCMDs/XFCNs for DAL and was wondering if anyone else has been able to open links into more than one remote database server at a time. It seems that some method should be available to swap in a new set of values into the global variables (cl1_id, etc.), and provide a means of management of multiple database links. I can't figure it out from the DAL manuals.

DISCUSSION ----------

It is possible with DAL (Data Access Language, formerly known as CL/1) to maintain multiple network sessions and/or multiple DMBS/Database connections.

The choices are:

- A single server connection with multiple DBMSes and Databases. VMS supports the most DBMS/Database combinations.

  Exceptions are:

  1) The VM server has only one DBMS and does not support more than one Database being open in one network connection.

  2) The TSO and VTAM servers will support both DBMSes (DB2 and Teradata) being open, but will only support one Database being open in DB2. (We're not sure about the number of open databases Teradata will support, because we don't have logon access to more than one database.)

- Multiple network connections to multiple servers, each with a separate

Network, DBMS and Database. To support multiple network connections would require multiple Userids.

In either case, the application must maintain control of the Database and DBMS that is being accessed.

The CL1Init XCMD automatically returns the session id in the cl1_id global. This session id can then be saved and used to control which connection is being used.

The DAL Interactive stack, which ships with the Data Access Language Developer's Toolkit, supports multiple connections and its scripts can be referenced for further information.

AppleShare Print Server: Can't Use Bin Info to Print (9/95)

Revised: 9/20/95
Security: Everyone

AppleShare Print Server: Can't Use Bin Info to Print (9/95)

==========

Article Created: 15 February 1993
Article Reviewed/Updated: 20 September 1995

TOPIC ----------

I print from a Macintosh computer with LaserWriter driver version 7.2, to a LaserWriter Pro 600. This all works fine, including selecting the bins for output. When I use the AppleShare Print Server with the latest drivers installed on the server, it cannot pass the bin information along.

DISCUSSION ----------

The solution is on the client side. You should bring up the Chooser and select the print spooler. You must then do a manual set up by holding down the Option key and clicking Setup in the Chooser dialog box. This will display a list of printers and options associated with those printers.

Once the setup is complete, you will have the ability to select different bins.

LaserWriter Pro: Emulation Switching with a Bridgeport (2/93)

Revised: 2/23/93
Security: Everyone

LaserWriter Pro: Emulation Switching with a Bridgeport (2/93)

==========

Article Created: 15 February 1993

TOPIC --

There is a device called a Bridgeport (made by Extended Systems) which determines if a file being sent to the printer is PCL or PostScript. It then sends a code to the printer to cause it to switch to the appropriate emulation.

Does the LaserWriter Pro use the same emulation switching codes as the LaserWriter IIf and LaserWriter IIg?

Also, how do I configure my LaserWriter Pro 630 when connected to the Bridgeport?

DISCUSSION --

The LaserWriter Pro 600 and 630, and the LaserWriter IIf and IIg, support the same PostScript and HP LaserJet emulation (PCL 4+) modes, so the BridgePort should work with both printers.

To configure your LaserWriter Pro for the BridgePort, you must set the thumbwheel rotary switch to one of the programmable settings between 6 to 9.

The BridgePort documentation outlines some additional settings. We suggest following the BridgePort instructions for the LaserWriter IIf and IIg.

LaserWriter Pro & MS-DOS, Windows: Setting Print Density (3/93)

Revised: 3/24/93
Security: Everyone

LaserWriter Pro & MS-DOS, Windows: Setting Print Density (3/93)

==========

Article Created: 16 February 1993

TOPIC ----------

How do I control a LaserWriter Pro's print density from MS-DOS or Windows?

DISCUSSION ----------

The only way to control the LaserWriter Pro's print density from MS-DOS or Windows is to download PostScript code directly to the printer. You can find the parameters in the LaserWriter Pro Developer's Notes (available from APDA) and then send the PostScript code to the printer with the LaserWriter Utility.

Note that you will see very little difference when you change the LaserWriter Pro's print density. The difference is small, and is about the same as the print density setting on the LaserWriter II printers.

LaserWriter 600: Minimum Margins (2/93)

Revised: 2/18/93
Security: Everyone

LaserWriter 600: Minimum Margins (2/93)

==========

Article Created: 15 February 1993

TOPIC ----------

The margins on the LaserWriter 600 are listed as being less than 1/4 inch. On some software packages, like ClarisWorks and MacWrite II, I can't set the margins less than 1/2 inch. The program informs me that the margins are set too small for the selected printer, and some data will be cropped. Why is this happening? This problem is also occurring on the HP LaserJet 4 printer.

DISCUSSION ----------

To be exact, the minimum margins for the LaserWriter Pro series are as follows:

	Inches
Minimum Left Margin:	.138
Minimum Right Margin:	.138
Minimum Top Margin:	.114
Minimum Bottom Margin:	.197

These values are what the print engine can accommodate. Margins, however, are also controlled at the application level. So these minimum margins may not be attainable from just any application. It really depends on what the application sets as its default limits. Applications that use PPD files (which provide printer-specific details such as imageable area) are more likely to be able to achieve the minimum margins.

In your case, it's the application-specific margin limits that prevent use of the minimum margins. You might select Larger Print Area in the Page Setup Options dialog. This should increase the printable area somewhat. If you really need to use the minimum margins, then we suggest using an application that uses PPD files.

Macintosh Operating System: Open File Limitations (2/93)

Revised: 2/18/93
Security: Everyone

Macintosh Operating System: Open File Limitations (2/93)

==========

Article Created: 15 February 1993

TOPIC ----------

Under the Macintosh operating system, there's a default limitation of 40 open files at any given time. I need to increase this number, and I understand utilities like SilverLining can modify the boot blocks to effect this. Please answer these questions for me:

1) What are the tradeoffs of increasing the number of open files possible?

2) How much additional memory is required by each open file?

3) How many open files does AppleShare 3.0 support?

4) Are there any limitations when the volume is a CD (HFS format)?

DISCUSSION ----------

Depending on what version of system software you're running, you may not need to modify the boot blocks. Starting with System 7, the number of open files possible became dynamic. System 7 now automatically increases the number of open files possible as needs dictate. Thus, modifying the boot blocks on a System 7 computer has no real effect.

Here are the answers to your questions. NOTE: Please keep in mind that modifying the boot blocks to increase the number of open files possible only makes sense in a System 6 environment. By the way, the value in the boot blocks is multiplied by 4; default is $0A hex (10 decimal) -- 10 x 4 = 40.

1) As you increase the number of open files possible, you increase the amount of memory taken (if the files are actually opened). This leaves less room for the operating system and applications, and could cause

potential problems if memory becomes too scarce. The amount of room taken by the actual FCBs (File Control Blocks) is minor: approximately 94 bytes in System 7, approximately 30 bytes in systems prior to System 7.

2) The amount of memory taken by each open file depends on the size and type of file it is.

3) Since AppleShare 3.0 runs on top of System 7, the number of open files possible is again dynamic. As far as a maximum number, it's the HFS limit -- 342.

4) No. The limitation is imposed by the operating system regardless of the size or type of volume(s).

LaserWriter Pro 630: Files on the Windows Disk (2/93)

Revised: 2/18/93
Security: Everyone

LaserWriter Pro 630: Files on the Windows Disk (2/93)

==========

Article Created: 15 February 1993

TOPIC ----------

With the LaserWriter Pro 630, Apple ships Windows 3.0 and 3.1 drivers that support PhotoGrade. Will these drivers also work with the LaserWriter IIg? If so, what are the ramifications or legal limitations of distributing these drivers to existing LaserWriter IIg DOS or Windows users?

DISCUSSION ----------

The LaserWriter Pro Windows disk actually doesn't contain any Windows drivers, but "configuration" files for the generic PostScript driver included with Windows. These files are used to supply printer-specific information to the Windows PostScript driver. They are analogous to Macintosh PPD (PostScript Printer Definition) files, and provide information such as printer resolution, fonts in the printer's ROM, imageable area, trays supported, and so on. Thus, you wouldn't use these files on a LaserWriter IIf or IIg, because they provide LaserWriter Pro information only.

In terms of support for PhotoGrade (and FinePrint for that matter), there are some additional files on the LaserWriter Pro Windows disk that in essence provide similar functionality to the LaserWriter Utility (such as, PhotoGrade and FinePrint enabling and disabling). You can try setting up these files for use with the LaserWriter IIg to see if PhotoGrade can be enabled or disabled, but this has never been tested. There are some instructions included in the disk's README file; you can find the full set of instructions in the LaserWriter Pro manual.

We have verified with Apple Product Marketing that you are free to distribute the files on the LaserWriter Pro Windows disk, as this is baseline functionality for the printers (that is, PhotoGrade capability on a LaserWriter IIf or IIg).

MacWrite II 1.1v3 and Earlier: Font Error Messages (9/94)

Revised: 9/15/94
Security: Everyone

MacWrite II 1.1v3 and Earlier: Font Error Messages (9/94)

==========

Article Created: 15 February 1993
Article Reviewed/Updated: 15 September 1994

TOPIC ----------

I often run into documents that have many fonts, and upon opening the document I receive error messages saying that the font isn't present in my Fonts folder. However, the fonts requested are present in the Fonts folder.

I removed some fonts from the Fonts folder, and it seems like some have conflicts with others. For instance, N. Helvetica Narrow, that ships with the new Apple Font Pack, seems to cause printing problems with documents using regular Helvetica in MacWrite II 1.1v3. When I remove N. Helvetica Narrow, the problem goes away.

DISCUSSION ----------

The problem has nothing to do with the particular fonts installed. It has to do with the way MacWrite II 1.1v3 looks for the fonts specified in a document. MacWrite looks for fonts based on FONT IDs instead of by name, as recommended. FONT resource IDs are routinely renumbered when installed, if there's any conflict with an existing FONT resource. Therefore there's no guarantee what ID any particular resource will have. This problem became more pronounced with the introduction of the Apple Font Pack, since customers started installing additional fonts.

MacWrite II 1.1v5 fixes this problem. Contact Claris Corp. for update information.

Article Change History:
15 Sep 1994 - Removed binary file.
22 Mar 1993 - REVISED to expand the TOPIC explaining the problem in more generalized terms. Retitled.

VT220 in VersaTerm or MacTerminal: Special Characters (2/93)

Revised: 2/19/93
Security: Everyone

VT220 in VersaTerm or MacTerminal: Special Characters (2/93)

==========

Article Created: 16 February 1993

TOPIC ----------

My department is connected to an IBM 286BBS. On all the IBMs, the correct special characters show up when typed. As an example, the key sequence for ó is alt 162 on the IBM. Whenever this character is typed, it will show correctly on any IBM display.

However, on the Macintosh, those characters don't show correctly. The ó will show as an o in quotations. Other special characters that have a problem are the ç, é, ñ. Is there any way to generate these special characters using VT220 emulation in VersaTerm or MacTerminal? The Macintosh computers are running VersaTerm and MacTerminal VT220.

DISCUSSION ----------

The information that I have states that VersaTerm has VT220 emulation that is supported by the Telnet tool which uses TCP/IP.

MacTerminal v3.0 doesn't have a VT220 tool, but it does have a VT320 tool, as well as the VT102 tool. These tools allow you to choose the language used in the emulator by selecting both the "National Replacement Set" and the "Active Character Sets" in the Terminal Settings of the Settings menu.

You may have to set it multiple times for different languages (French, Spanish, and so on) if the one chosen doesn't support all the characters you need. Be aware that these character sets only contain 128 characters.

Here's some information from VersaTerm:

• VersaTerm isn't localized "as shipped".

• VersaTerm is localizable. Refer to the "ReadMe" in the Fonts folder

on the disk for instructions on how to localize.

- VersaTerm supports Digital's "multi-national language support" on the mainframe. If this feature is turned on in the host, there's no need to localize the Macintosh software.

- The above statements are true for both VersaTerm and VersaTerm Pro. These statements have been true for prior releases of both these products. The current release of VersaTerm is 4.6 and the current release of VersaTerm Pro is 3.6. For System 7 the current release levels are suggested, but they aren't mandatory to afford the language localization support.

Synergy Software supports VersaTerm. To locate a vendor's address and phone numbers, use the vendor name as a search string.

ISO 9660: Translator Difficulties Accessing DOS CD-ROMs (1/94)

Revised: 1/4/94
Security: Everyone

ISO 9660: Translator Difficulties Accessing DOS CD-ROMs (1/94)

==========

Article Created: 18 February 1993
Article Reviewed/Updated: 4 January 1994

TOPIC ----------

I've been trying to use DOS CD-ROMs with the Macintosh and have come across some anomalies. One solution I investigated was making CD-ROMs available to a network, using File Sharing or AppleShare. Then the network Macintosh could mount the CD and access it using SoftPC AT.

In trying this, I discovered that ISO 9660-formated CD file extension names became garbled when accessing the network-mounted CD with SoftPC. The same software works fine when mounting the CD locally, and file names appeared normal.

Insignia told me that there's a problem with the ISO 9660 translator that comes with Apple's CD-ROM software and that it causes garbling of the file name extensions.

DISCUSSION ----------

In summary, the version information defined in the ISO 9660 specification, isn't required and isn't widely used. Apple's ISO 9660 driver does pass the version information along when doing the conversion. The problem with appending the version suffix (;1) to every filename has been fixed. CD-ROM Setup 5.0 fixes the problem and no longer adds the version suffix. The software is available on AppleLink in the Apple Software Updates bulletin board.

Detailed Explanation

The ISO 9660 specification defines a file specification consisting of five parts:

• A file name, of alphanumerics plus underscore

- a period (".")
- A file extension, of alphanumerics plus underscore
- a semicolon (";")
- A file version number, of numerics between 1 and 32768

Either the file name or file extension may be optional. All the other parts exist.

Nomenclature

There are four basic ways in which implementations of ISO 9660 seem to differ.

You can encode these as [Pp], [Uu], [Vv], and [Xx]:

P/p	Show/hide trailing periods
U/u	Display alphabetic characters in UPPER/lower case
V/v	Show/hide version numbers (;1)
X/x	Files are/aren't executable

Here's a summary of what some vendors are doing about U, V, and X:

0	uvx	Irix, Linux
1	uvX	386BSD, BSD/386, SunOS
2	uVx	[none known]
3	uVX	AIX, IS/IX
4	Uvx	MS-DOS? Windows?
5	UvX	HP-UX MS-DOS? Windows?
6	UVx	MachTen, Ultrix, Macintosh OS (by default)
7	UVX	Macintosh OS (if Apple Extensions to ISO 9660 are used for executable files)

The question marks after the DOS and Windows entries are there because DOS and presumably Windows rely on extension naming conventions to establish executability.

Holes in the Standard

The hole in the standard is that the last section of it, "Requirements for systems," describes a very incomplete implementation.

In the ISO 9660 standard, Section 3 (Requirements for systems) Part 12, Requirements for an originating system, it says "The implementation shall allow the data preparer to supply the information that is to be recorded in each of the descriptor fields listed below, and shall supply the information for a field if the data preparer does not supply it." The list DOES include "File Version Number of a File Identifier."

However, the following section, Part 13, Requirements for a receiving system, it says "The implementation shall make available to the user the information that is recorded in each of the descriptor fields listed below" and the list that follows DOESN'T include "File Version number."

The ISO 9660 file system translator written for the Macintosh follows Part 12 instead of Part 13 when deciding to pass version numbers to the Macintosh operating system. In retrospect, that wasn't the best way, primarily because MS-DOS's MSCDEX doesn't handle version numbers. This makes Macintosh-to-DOS file name translation difficult.

Two Possible Solutions

- Rewrite the "ISO 9660 File Access" file system translator so that it can optionally pass the ";1" or truncate it.

- Convince the third-party company (in this case, Insignia) to have an option in their software that allows them to truncate file names ending in ";1".

Article Change History:
4 January 1994 - Added "fix" information for the ";1" problem. CD-ROM Setup 5.0 fixes the problem.

Font Pack: Some Fonts Give Double Image in Bold (2/93)

Revised: 2/22/93
Security: Everyone

Font Pack: Some Fonts Give Double Image in Bold (2/93)

==========

Article Created: 19 February 1993

TOPIC ----------

Some fonts in the Apple Font Pack print out a double image when in the bold style. The fonts we've seen with this problem don't have an explicit "bold" version. Two examples we have verified are Onyx and Oxford. The double exposure is easier to see at larger point sizes.

The workaround is not to use bold styles for these fonts, since there isn't a bold version defined for them.

DISCUSSION ----------

When font developers consider creating a separate glyph set for bold and italic, they base their decision on aesthetics. If a particular font (for example, Symbol, Oynx, Oxford, Chicago...) doesn't look pleasing to the eye when in bold or italics, the developer doesn't create a separate TrueType font face.

When there's no collection of glyphs in a particular typeface and style, QuickDraw must add any additional stylistic variations needed. The default bolding function works very well on many fonts. However, this function doesn't produce an aesthetically pleasing look (that is, the edges aren't mitered) on ornate fonts. The look is very apparent when the text is produced at larger sizes or when sent to high resolution raster output devices.

Because Apple doesn't want to limit the user's choices, the user isn't prevented from using the bold style by a grayed out menu selection. Therefore, the user can decide whether the look of the bold font is appropriate.

Macintosh 16-inch Color Display: Pinouts (2/93)

==========

Article Created: 22 February 1993

TOPIC ----------

What are the pinouts for the Macintosh 16-inch Color Display?

DISCUSSION ----------

Here are the Macintosh 16-inch Color Display pinouts for the CPU end of the video cable:

Pin	Signal
1	Red video ground
2	Red video
3	Composite sync (not used)
4	ID Bit 1
5	Green video
6	Green video ground
7	ID Bit 2 (not used)
8	not used
9	Blue video
10	ID Bit 3
11	VSYNC ground
12	VSYNC
13	Blue video ground
14	HSYNC ground
15	HSYNC
Shell	Shield ground

Connect pins 4 and 10 at the monitor end of the video cable to make the Macintosh 16-inch Color Display sense line connection.

System 7: Limitations of the Finder (6/95)

==========

Article Created: 5 February 1993
Article Reviewed/Updated: 9 June 1995

TOPIC ----------

This article gives the limitations of the System 7 Finder and the HFS limits.

DISCUSSION ----------

Finder Limits

- Number of open files: 346
- Number of Apple Menu Items: 52 (more items can added, but only 52 appear when clicking on the Apple Menu icon)
- Number of files supported by the Desktop: Unlimited (limited to the available disk space -- see HFS limit)
- Number of applications in memory: The Finder does not limit the number of applications, but the amount of available RAM does.
- Number of volumes available on the Desktop: 32
- Number of items in a folder by list view: Up to 32,000 depending on the computer and RAM. (See the note at the bottom of this article.)
- Number of resources in the System File: 32,767 or 16 Megabytes
- Number of System Extensions or Control Panels that can be loaded into memory: The Finder does not limit these, but hard disk space and RAM can limit them.
- RAM allocated to an application with Finder = 99,999K
- The Finder supports 24-bit color, BUT icons are only 8-bit.
- QuickDraw supports 48-bit color, but the current operating system maximum is 32-bit color.
- Disk cache: 320 KB per megabyte of installed RAM

HFS Limits

- 64K items or 65,536 items per volume
- The maximum length of a pathname under the Finder--including the Volume

and Folder--is 255 characters, including colons. For example:

InternalHD:Folder1:Folder2:Filename = 35 characters

"Inside Macintosh, Volume IV" states that there is no limit to the number of levels of subdirectories. Because of pathname limitations, it is not always possible to specify a file using its full pathname.

This limitation has nothing to do with the Finder; it is a limitation of the file system.

Note: Attempting to view large numbers of files in one window, something in the range of 500 - 1500 files creates very slow opening times and drop-out viewing problems. The specific number depends on RAM and CPU.

Article Change History:
09 Jun 1995 - Made grammatical correction.
11 Jan 1995 - Incorporated information from article 5188.
21 Sep 1994 - Changed spec for Disk Cache.

LC III & LC 575: Use Latest ROMs in Ethernet LC Card (12/94)

Revised: 12/16/94
Security: Everyone

LC III & LC 575: Use Latest ROMs in Ethernet LC Card (12/94)

==========

Article Created: 16 February 1993
Article Reviewed/Updated: 16 December 1994

TOPIC ----------

Are there any problems with the Apple Ethernet LC Card (the one requiring the Thin Coax Transceiver) in a Macintosh LC III or LC 575? We're getting a, could not switch to EtherTalk due to an error and that built-in LocalTalk will be used instead, error whenever we switch to Ethernet in the Network Control Panel.

DISCUSSION ----------

Be sure your Ethernet LC Card (M0443LL/C or part number 661-0621) has the new ROMs. There was a ROM upgrade for the card, which updated the drivers. Here are the part numbers:

New Apple Ethernet LC Card	Old Apple Ethernet LC Card
Finished Goods (Assembly)	Finished Goods (Assembly)
P/N: 670-2008	P/N: 670-4443
ROM P/N: 341-0470	ROM P/N: 341-0842

Also, make sure to install the EtherTalk software from the System 7.1 or later disks.

Article Change History:
16 Dec 1994 - Added better description of the Apple Ethernet LC Card.
08 Sep 1994 - Added Macintosh LC 575.

LaserWriter Driver Compatibility: System 7.0x, 7.1 (9/95)

Revised: 9/20/95
Security: Everyone

LaserWriter Driver Compatibility: System 7.0x, 7.1 (9/95)

==========

Article Created: 19 February 1993
Article Reviewed/Updated: 20 September 1995

TOPIC ----------

In the "MacWorld", March 1993 issue, page 95 under Bug Reports, there is the following report: "System 7.0x and System 7.1 Laser printer drivers for the two systems are incompatible, so printers fail when switching between documents sent by 7.0 and 7.1 users unless the printer is first reinitialized."

Is this report true?

DISCUSSION ----------

Apple is not aware of the compatibility problems mentioned in this issue of "MacWorld". Nor have we had any reports or reproducible cases that would substantiate the "MacWorld" article. Basically, any LaserWriter driver version 6.1 or later resolved the issue of "Laser Wars" because the LaserWriter Prep file is incorporated in these printer drivers, and is downloaded with each print job. This prevents the printer from having to reinitialize itself.

FDDI Connection For Macintosh (2/93)

Revised: 2/18/93
Security: Everyone

FDDI Connection For Macintosh (2/93)

==========

Article Created: 16 February 1993

TOPIC ----------

Do you know of any FDDI NuBus cards for Macintosh to connect to a FDDI network?

DISCUSSION ----------

To locate a vendor's address and phone number, use the vendor name as a search string.

Two vendors announced FDDI NuBus cards at MacWorld in San Francisco in January 1993. Briefly some background on each solution:

• Codenoll Technology Corporation

Products: CodeNet 9550, 9553 and 9750 NuBus FDDI for Single Attached Station (SAS), Dual Attached Station (DAS) and Shielded Twisted pair over FDDI (SDDI) network adapters for Apple Macintosh II and Quadra systems. CodeNet adapters ship with support for Apple's MacTCP, A/UX, AppleShare and other FDDITalk compatible network environments. FDDITalk Network software is shipped with the cards. According to Codenoll, support for FDDITalk is part of AppleTalk version 58.0 and all AppleTalk transactions can be supported over the 100Mbps FDDI network. Codenoll also indicated that they support TCP/IP connections using MacTCP and can send messages to the SNMP console supporting the Apple MIBs if AppleTalk version 58.0 is installed. Available Feb 1,1993.

• Impulse Technology

Products: Spectra NB is a FDDI compatible NB card for Macintosh II and Quadra machines. Hardware comes with FDDITalk so support for all AppleTalk

protocol products in the Macintosh is ensured, including the Apple Internet Router. AppleTalk version 58.0 is required. Impulse also ships a file transfer utility called Ditto which according to the vendor, can transfer data between Macintosh computers at 1Mbps. This is due to the larger FDDI packet size of 4500 bytes and background operation combined with the higher speed network. There is also an evaluation kit available, called Spectra EK for first time buyers which includes two Spectra NB cards and a 10 meter duplex cable to connect the two cards. Available Jan 1,1993. Support for MacTCP is expected in mid 1993.

All vendors strongly recommend upgrading or accelerating the Macintosh II to a 68040 machine with either 25 or 33 Mhz speed with FPU for better performance.

SNA•ps Gateway and TCP/IP to IBM Host (2/93)

Revised: 2/18/93
Security: Everyone

SNA•ps Gateway and TCP/IP to IBM Host (2/93)

==========

Article Created: 16 February 1993

TOPIC ----------

I am interested in connecting my Macintosh computers into my host IBM mainframe. My network is currently Ethernet running TCP/IP into the channel on the host. Can the SNA•ps Gateway connect into the host using TCP/IP transport?

DISCUSSION ----------

SNA•ps does not support TCP/IP transport. It supports SNA over SDLC and Token Ring. There is no planned support for gateways using TCP/IP over Token Ring or Ethernet. The reason for this is TCP/IP connections do not need a gateway. There are products from vendors which implement TN3270, which is a 3270 emulator running on top of MacTCP directly to the TCP/IP host. We have successfully used Avatar's MacMainFrame 3270 product with TCP/IP support.

We have TN5250 to AS/400s for the same reason. No gateway is needed, just access to the TCP/IP utilities in the AS/400.

Article Created: 9 February 1993

TOPIC ----------

I am looking for a higher level of security between a SNA•ps Gateway 1.1 and the SNA•ps Admin application. I like the ability to lock the gateway so others can't stop the gateway; however I want the same password protection applied to starting locked gateways. Anyone can start a stopped gateway on an AppleTalk network if they have a copy of the SNA•ps Admin program. I use an expensive SDLC connection; is there a way to lock users out from a stopped SNA•ps gateway?

DISCUSSION ----------

You are correct about the way SNA•ps gateway works, which is also according to the original design plan. The reason that starting gateways has not required password is because the Settings in the gateway allow for automatic startup at boot and user startup as well. These "user friendly" gateway startup requests should not have a password attached. The idea was to allow unattended gateways to be started if machines were powered down by power failure and power returned or a user wanted to come into an unstarted gateway. The User start feature is used a great deal.

If you do not have SNA•ps ADMIN, you cannot start a stopped gateway that does not enable User Start. No user can stop a started gateway without SNA•ps ADMIN and a password, if one is entered into the Gateway settings.

Now it appears that you have autodialing SDLC gateways, which incur an expense if they are used. So the situation is someone at your site wants to use the SNA•ps Gateway, it needs to be started and it has to make an expensive connection (dial), and this is a problem. We have to conclude that the SNA•ps Gateway administrator desires to start and stop this gateway and block users from doing that process.

Solution

The gateway is configured with the Line set for "Not Automatically Activate" -- that is, do not select the check box to the left of the option. Apply password security to the gateway for stopping and do not select user startup in the gateway settings. It is OK to select automatic startup in the gateway settings this will download the gateway code and config to the MCP card when the Macintosh boots.

With this setup, the line is not going to be allowed to make a dial SDLC connection until SNA•ps ADMIN is used to display the gateway status, the line name is highlighted, and the resource is activated under the resource menu. With a password protected gateway, the line resource CANNOT be activated, in SNA•ps ADMIN, without the PASSWORD. We think this is what you want. The gateway is started but the line cannot be activated without the password, hence no SDLC connection.

GrayShare Printer Driver: Number of Simultaneous Users (3/93)

Revised: 3/24/93
Security: Everyone

GrayShare Printer Driver: Number of Simultaneous Users (3/93)

==========

Article Created: 18 March 1993

TOPIC ----------

How many users can a printer using a GrayShare printer driver have at one time?

DISCUSSION ----------

Printers that use the GrayShare printer driver can only have 21 users with open connections to the printer at any one time. Only 21 sockets, or logical connections to the network, are allocated by the GrayShare software for printing.

However, any number of users may choose a printer which uses a GrayShare printer driver as their selected printer.

These printers use the GrayShare printer driver:
- Apple Color Printer
- LaserWriter Select 300
- StyleWriter II

Photo CD Access: QuickTime and CD-ROM Players (8/96)

Revised: 8/19/96
Security: Everyone

Photo CD Access: QuickTime and CD-ROM Players (8/96)

==========

Article Created: 19 February 1993
Article Reviewed/Updated: 19 August 1996

TOPIC ----------

How does the Photo CD Access extension file work with QuickTime 1.5? Does it tie directly to QuickTime, or is it dependent on the CD-ROM manufacturer as well? How is the Photo YCC translation accomplished?

I have a third-party CD-ROM player, and I want to read Photo CD discs. Does the CD-ROM player manufacturer have to provide the Photo CD extension, or can I use Apple's Photo CD Access?

DISCUSSION ----------

Photo CD Access and QuickTime 1.5

It's correct that QuickTime and Apple Photo Access extensions can perform functions independently, without the presence of the other. HOWEVER, to actually open a Photo CD image from within an application, you need BOTH QuickTime 1.5 (or later) and Apple Photo Access.

Apple Photo Access provides the ability to mount, on the desktop, a foreign file system as a native Macintosh HFS file system. Photo CDs are definitely a foreign file system. The main point here is -- if the Photo Access extension is alone (that is, no QuickTime 1.5), mounting the Photo CD as a native volume is all that can take place. Photo Access permits the Macintosh HFS file system to recognize the CD as a Macintosh volume which has Macintosh resources. For example, if you use ResEdit to open one of the image files, it will display icon resources which are associated with that image file. It will also have a PICT resource that states that QuickTime is needed to display the Photo CD image file.

On a more general note, if Foreign File Access (FFA) extension isn't installed, the Photo CD won't be recognized and you can eject it. If FFA is installed, yet Apple Photo Access isn't, the Photo CD mounts as a

generic ISO 9660 disc. You'll see "generic" icons, and the Slide Show and Slide Show Viewer won't appear in the volume's window.

If you want to do more than simply mount the Photo CD on the desktop as a Macintosh volume, you will absolutely need BOTH extensions.

Photo YCC Translation

QuickTime 1.5 allows you to use Photo CD images on the Macintosh. This step translates the Photo CD Image Pacs from the Kodak YCC format to the standard Macintosh PICT format. If the Apple Photo Access extension isn't present, QuickTime can't access the images on the Photo CD. And, in turn, can't translate or decompress the images on the Photo CD. For example, without Apple Photo Access, Photoshop doesn't offer any of the image files in the standard Open… dialog box.

In other words, Apple Photo Access "makes" the Photo CD into a Macintosh volume; and QuickTime (1.5 and later) "makes" the Photo CD image files into PICT image files. Both Apple Photo Access and QuickTime must be present to have useful access to Photo CDs.

Third-Party CD Players

As for compatibility of third-party CD players, there are elements that must be present in the basic drive -- the primary one is the ability to handle CD-XA. Then there's the issue of single session versus multisession access. These two issues are based on the drive mechanism.

A CD-ROM drive mechanism that doesn't have CD-XA ability can't be corrected by software. A CD-ROM mechanism that is single session can't be made to have multisession ability with software. These must be addressed within the drive mechanism. Without CD-XA ability, Apple software won't correct the situation. Once a drive is CD-XA capable, the drive may be single session or double session. Our software won't change this hardware limitation.

The general compatibility rule is: a well-written CD driver should be written to use Apple's Foreign File Access software. If it can use Apple's FFA, then it can use Apple Photo Access. This is because Photo Access is a File System Translator (FST), which is a FFA module. So technically, it should be no problem to use Photo Access with a correctly written CD driver from a third party.

This brings up the question of what is legitimate distribution for Apple's FFA and FSTs. The standard mode of operation is for the third-party hardware company to contact Apple Software Licensing for a distribution license agreement.

DAL For AS/400: SSID or Tables Described In The View (9/94)

Revised: 9/1/94
Security: Everyone

DAL For AS/400: SSID or Tables Described In The View (9/94)

==========

Article Created: 17 February 1993
Article Reviewed/Updated: 1 September 1994

TOPIC ----------

What is the point of using SSID in the Environment file to declare databases on an AS/400? In my opinion, we have a filter on the tables with the DALDBVO1 file (the view) in the library of the same name as that of the user.

If you declare two databases in SSID, users can choose which ever they want, and will see only the tables described in the DALDBVO1 file (I have used DataPrism for this test).

DISCUSSION ----------

We agree that there isn't much point in worrying about the values of the SSID= field for the DAL AS/400 Server.

If you listed multiple SSIDs in the Environment file, you would find that only the tables listed in the user's view (DALDBV01) really mattered. Choosing a different database makes no difference to the table list -- it will always be as defined in the view.

This occurs because the AS/400 operating system, and the SQL/400 product, are quite different from other operating systems and Database Management Systems (DBMS).

Since DAL attempts to remain homogeneous across many platforms, some items make more sense in certain environments rather than in all of them. So... just create a meaningful "database name" and then just go with the flow knowing that the view definition will be the most meaningful constraint on access.

With a license agreement between Apple Computer and ITI (Independence Technologies, Inc.), ITI will market DAL products and provide all support to DAL customers. To locate ITI's address and phone number, use ITI as a search string.

DAL Server for AS/400: Error, Majorcode=5, Minorcode=6 (2/93)

Revised: 3/8/93
Security: Everyone

DAL Server for AS/400: Error, Majorcode=5, Minorcode=6 (2/93)

==========

Article Created: 17 February 1993

TOPIC ----------

I am evaluating Apple software and hardware and third-party software solutions for Macintosh to AS/400 integration. The Apple software is SNA•ps and DAL Server for AS/400 (1.3.7). I am having problems with DAL.

The DAL Server is working on the AS/400; that is, the testing with IDAL is fine. The SNA•ps Gateway is working; that is, sessions are available and I can open a session. With DAL Tester (debugger enabled) I almost get the complete connection until the following error occurs: APPCrawrcu, status=-1, ioresult=-1, majorcode=5, minorcode=6, convState=7 Error -10632. The AS/400 indicates that the UserID is not valid, but I'm logging in as QSECOFR. What could be wrong?

DISCUSSION ----------

We have tested with some possible errors, and we believe the problem is you forgot to type the Password in uppercase.

If the UserID is not entered in uppercase, the error is a major code 2 and a minor code 6. When the UserID is entered properly, in uppercase, but the Password is entered in lowercase, then the error of a major code 5 and minor code 6 is returned.

Terminal emulators automatically translate lowercase characters to uppercase. The DAL client driver does not convert lowercase to uppercase and the AS/400 understands uppercase entries only. In addition, if you used the DAL Tester application, the "open Database XXXX" command requires the database name (XXXX) to be entered in uppercase.

We will notify Publications of the need to document "that the UserID, Password and Database Name MUST be entered in uppercase" as the DAL Client,

and SNA•ps APPC network adapter, do not do that translation for the user.

StyleWriter II: 1 MB RAM and Minimum System Config. (8/95)

==========

Article Created: 19 February 1993
Article Reviewed/Updated: 7 August 1995

TOPIC ----------

I cannot print to a StyleWriter II from a Macintosh that has 1 MB of RAM and System Software 6.0.7. The StyleWriter II product specification sheet says that this configuration should work.

DISCUSSION ----------

A Macintosh with 1 MB RAM works with the StyleWriter II with this configuration only:

- Minimum installation script in the installer.
- StyleWriter II Print Driver (only).
- TrueType INIT only (no other INITs, control panels or other system additions).
- Minimum fonts.
- MultiFinder turned off.
- RAM cache off.
- Print color or grayscale images in black-and-white mode.

For optimum performance, Apple recommends a minimum of 2MB RAM.

StyleWriter II: How to Use With a Low-Memory Macintosh (2/93)

Revised: 2/23/93
Security: Everyone

StyleWriter II: How to Use With a Low-Memory Macintosh (2/93)

==========

Article Created: 19 February 1993

TOPIC ----------

This article describes how to optimize a StyleWriter II printer with a low-memory Macintosh configuration.

DISCUSSION ----------

If you have a Macintosh with 2MB RAM and System 7, or 1MB RAM and System 6 -- and you are printing to a StyleWriter II, you may occasionally run short of memory.

You know you are low on memory when:
- Some documents do not print.
- Some fonts may be displayed and printed in the Geneva font.
- The printed document looks jagged on the edges rather than smooth.
- You may get an "out of memory" message on your screen.

Workarounds

Here are some ways to make more memory available:

- Open only one application at a time.

- Print color or grayscale images in black-and-white mode.

- Make sure the RAM cache is turned off or set as low as possible. To adjust the RAM cache, use the Memory Control Panel in System 7 or the Control Panel in System 6.

- If you are using System 6, make sure MultiFinder is turned off. To turn MultiFinder off, choose Set Startup from the Special menu. In the dialog box that appears, choose Finder. The next time you start up or restart

your Macintosh, MultiFinder will be turned off.

- If you are using System 7, try printing with background printing turned off.
- INIT files in the system folder usually use up some of your Macintosh's RAM. Remove INIT files to free up some memory.
- If you get "not enough memory" errors while printing to a shared StyleWriter II, then turn background printing off.
- If you have only 2MB of RAM with System 7, or 1MB of RAM with System 6, you may want to add more memory to make your Macintosh work more effectively.

Quadra 950, A/UX 3.0: Serial Switch Setting for System V Spooler

Revised: 2/19/93
Security: Everyone

Quadra 950, A/UX 3.0: Serial Switch Setting for System V Spooler

==========

Article Created: 19 February 1993

TOPIC ----------

It appears that Quadra 950s running A/UX 3.0 using the System V spooler (lp) and serial ports have the same problem that the IIfx had running A/UX 2.0 with System V spooler (lp) and serial ports.

DISCUSSION ----------

Symptoms: Spool some jobs using lp to a serial port on a Quadra 950. Cancel a spool job. The port locks up (and sometimes the Quadra as well).

Solution: The Quadra 950 needs the Serial Switch (1.1) set to compatible mode to successfully use the System V spooler.

PB Duo: Why Battery DA Fluctuates When Connected to AC (4/95)

==========

Article Created: 19 February 1993
Article Reviewed/Updated: 21 April 1995

TOPIC ----------

When using the Battery Desk Accessory (DA), on a Macintosh PowerBook computer, I have noticed that when I connect or disconnect the AC Adapter, the battery level indicators fluctuate slightly. Is this normal?

DISCUSSION ----------

The charge indicated on the Battery DA fluctuates slightly when AC power is applied or removed. This is related to the load placed on the battery.

When AC power is avalialbe, the load of the charging battery and the PowerBook itslef is transferred to the power adapter, thus the Battery DA indicates a slightly higher battery level.

Once the AC adapter is removed and the full load of the PowerBook is transferred to the battery, the level drops slightly to indicate this increased load.

System 7.1 & Shared Code Manager: Problem & Cure (2/93)

Revised: 2/23/93
Security: Everyone

System 7.1 & Shared Code Manager: Problem & Cure (2/93)

==========

Article Created: 23 February 1993

TOPIC ----------

We have repeatedly experienced system hangs using PowerPoint 3.0 on a PowerBook 180 in 32-bit mode. Nothing else is running except the Finder, and all extensions have been turned off.

DISCUSSION ----------

The Problem

Microsoft Technical Support verifies that the problem is not in PowerPoint 3.0, but in the Shared Code Manager extension -- an additional component of some Microsoft applications that provides OLE (Object Linking Embedding) capability.

With this extension installed, any Macintosh running System 7.1, and that also uses a System Enabler, may experience a system crash. Macintosh systems running System 7.1, and that do not require a System Enabler, do not have this problem.

Solutions

Microsoft has a patch to resolve this issue, and customers are advised to call Microsoft at 800-426-9400.

For an immediate workaround, customers can simply remove the Shared Code Manager extension from the System Folder, and PowerPoint will work fine -- except for the loss of OLE.

LaserWriter IIf, IIg, and Pro: Changing AppleTalk Type (3/93)

Revised: 3/24/93
Security: Everyone

LaserWriter IIf, IIg, and Pro: Changing AppleTalk Type (3/93)

==========

Article Created: 9 March 1993

TOPIC ----------

How do I change the "type" of my LaserWriter IIg from "LaserWriter" to "LW Spooler" to prevent the LaserWriter from appearing in the Chooser?

I've been able to do this with PostScript Level 1 LaserWriters. When I change the "type" of PostScript Level 2 LaserWriters, the change isn't permanent and I lose the setting when I restart.

DISCUSSION ----------

To change the LaserWriter IIg's AppleTalk type so the printer will keep this setting after the power is cycled, the printer's push-button switch must be at position 6, 7, 8, or 9. These are the switch positions that allow access to the non-volatile parameters such as "EtherTalkType". This is true for any ROM revision.

With the LaserWriter IIg's push-button switch at position 6, 7, 8, or 9, download this PostScript Level 2 program to change the AppleTalk type on the EtherTalk port:

```
(%EtherTalk_NV%) <</EtherTalkType (LW Spooler)>> setdevparams
```

With the LaserWriter IIg's push-button switch at position 6, 7, 8, or 9, download this PostScript Level 2 program to change the AppleTalk type on the LocalTalk port:

```
(%LocalTalk_NV%) <</LocalTalkType (LW Spooler)>> setdevparams
```

In either case, the printer will immediately change its AppleTalk type. Please note that if the printer switch is set to position 0, 1, 2, 3, 4, or 5 and restarted, the AppleTalk type will revert to "LaserWriter". Going back to

switch position 6, 7, 8, or 9 and restarting will cause the AppleTalk type become "LW Spooler" again.

This information is also applicable to the LaserWriter IIf and LaserWriter Pro family.

StyleWriter II: Compatibility with Apple IIe Card (3/93)

Revised: 5/23/95
Security: Everyone

StyleWriter II: Compatibility with Apple IIe Card (3/93)

==========

Article Created: 18 March 1993

TOPIC ----------

Is the StyleWriter II compatible with the Apple IIe Card?

DISCUSSION ----------

Yes, when using version 2.0 or later of the Apple IIe Card software, the StyleWriter II is compatible with the Apple IIe Card.

With version 2.0 or later of the IIe Card software, all printing requested from the Apple IIe Card environment is sent from the "printer slot" to the Macintosh Print Manager. Any printer, therefore, that is compatible with the Macintosh Chooser is compatible with the Apple IIe Card.

To check which printer the Apple IIe Card will print to, follow these steps:

1) From the Apple IIe environment, bring up the IIe Option Panel by pressing the Control, Command, and Escape keys at the same time. You will see icons representing the configurable parts of the IIe environment.

2) Double-click the Printer Card icon on the left side of the Option Panel. This will produce a screen which will display (among other things) which printer the IIe Card will print to.

QuickTime for Windows: Compression Algorithms (2/93)

Revised: 2/25/93
Security: Everyone

QuickTime for Windows: Compression Algorithms (2/93)

==========

Article Created: 24 February 1993

TOPIC ----------

What compression does QuickTime for Windows use? I'm particularly interested in Video for Windows compression technique and whether QuickTime uses or supports it.

DISCUSSION ----------

QuickTime uses five proprietary compression algorithms (Apple Video, Apple Compact Video, Apple Animation, Apple Graphics, and Apple Raw), and one JPEG international standard algorithm (Apple Photo Compressor). Each of the algorithms is best suited for a different type of image:

- The Apple Video Compressor is best suited to digitized video content that needs to be displayed at interactive speeds.

- The Apple Compact Video Compressor is best suited to compressing 16-bit and 24-bit video sequences. It typically obtains higher compression ratios, better image quality, and faster playback speeds than the Apple Video Compressor. However, it takes significantly longer to compress images than the Apple Video Compressor.

- The Apple Animation Compressor is best suited to animation and computer-generated video content. Images captured from videotape generally have considerable visual noise, which can degrade the compression effectiveness.

- The Apple Graphics Compressor is a better choice than the Animation Compressor whenever performance is less important than compression ratio. Generally, the Graphics Compressor generates a compressed file that is half the size of the same image compressed by the Animation Compressor. However, the decompress speed of the Graphics Compressor is half that of

the Animation Compressor.

- The Apple Raw Compressor is useful for reducing image storage requirements by converting an image from one pixel depth to another. Resulting compression ratios are identical to the change in pixel depth ratio, that is, 32 bit to 16 bit gives 2:1 compression and 32 bit to 24 bit gives 4:3 compression.

- The Apple Photo Compressor implements the Joint Photographic Experts Group (JPEG) algorithm. It's most suited for still image compression.

Video for Windows offers only two proprietary compression algorithms, Intel Indeo and Microsoft Video1. Intel Indeo is used for performance playback of digitized video and Microsoft Video1 offers better compression than Indeo but slower playback.

At this time, QuickTime and Microsoft's Video for Windows are competing to become the Video standard for PCs. QuickTime doesn't currently use or support Video for Windows compression techniques.

Macintosh 32-Bit System Enabler:Requirements & Installation 4/97

Revised: 4/28/97
Security: Everyone

Macintosh 32-Bit System Enabler:Requirements & Installation 4/97

==========

Article Created: 26 February 1993
Article Reviewed/Updated: 9 April 1997

TOPIC ----------

The Macintosh 32-Bit System Enabler is a system software extension that provides access to the memory addressing features of system software 7.1. This is the MODE32 replacement product.

DISCUSSION ----------

System Requirements
==========
The 32-Bit System Enabler requires a Macintosh II, IIx, IIcx, or SE/30 with system software version 7.1 installed, 4 megabytes (MB) of RAM or more, an Apple FDHD SuperDrive, and a Paged Memory Management Unit (PMMU).

What the Enabler Does
==========
The 32-Bit System Enabler provides unrestricted use of the system software's memory expansion features. Without these capabilities, these systems do not have the internal capabilities to take advantage of 32-bit addressing.

Macintosh 32-bit addressing allows use of more than 8 MB of RAM. The Macintosh II can access up to 68 MB of RAM when the extension is installed. The Macintosh IIx, IIcx, and SE/30 can access up to 128 MB of physical RAM. Only users running System 7.1 (or higher) with these systems should install this enabler.

Besides the additional RAM, the system software extension can also access virtual memory. A paged memory management unit (PMMU) is necessary to access virtual memory using a Macintosh II.

Installation

To install the 32-Bit System Enabler, follow these steps:

Step 1
Drag the 32-Bit System Enabler icon to the System Folder icon on the start-up disk.

Step 2
Restart the Macintosh.

How To Turn On 32-bit Addressing

Step 1
Choose Control Panels from the Apple menu.

Step 2
Open the Memory control panel.

Step 3
In the section for 32-Bit Addressing, click On.

Step 4
Restart the Macintosh.

After Installation

Turn off Balloon Help When Using the Color Wheel

Turn off Balloon Help when you use the color wheel dialog box. (The color wheel dialog box appears when you choose a color in many programs and control panels.)

Upgrade SuperClock to v3.9.1

If you use SuperClock version 3.9 or earlier, you need to upgrade to version 3.9.1 (available on many public bulletin boards).

Availability

The Macintosh 32-Bit System Enabler is licensed to users free of charge through various on-line services, including America- Online and CompuServe. The enabler will also be available through Macintosh user groups in the United States.

These articles can help you locate the software update mentioned here:

- Where To Find Apple Software Updates
  Lists online services for "free" Apple software updates.

- Obtaining Apple Product Support in the USA
  Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech. Info. Library.

Article Change History:
09 Apr 1997 - Removed out dated on line references.
21 Feb 1995 - Revised article to be more specific about system requirements.

Macintosh Hardware System Update 1.0: Description (10/93)

Revised: 10/20/93
Security: Everyone

Macintosh Hardware System Update 1.0: Description (10/93)

==========

Article Created: 26 February 1993
Article Reviewed/Updated: 19 October 1993

TOPIC ----------

The Macintosh Hardware System Update version 1.0 contains a set of software enhancements that address specific problems a small number of Macintosh computer users encounter. This update requires system software version 7.1. Only customers experiencing the problems described in this article should install the update. Do not install this update on a Macintosh Performa.

The Hardware System Update 1.0 is provided on a high density floppy disk. It isn't provided on an 800K disk because the fixes it contains apply only to Macintosh models with SuperDrives.

DISCUSSION ----------

What the Update Does

The Update provides system-level improvements that fine-tune the system clock and make high-speed modem communications more reliable for users of Macintosh LC, LC II, IIsi, IIvx, IIvi, Classic II, Quadra 900, and 950 systems.

In addition, the Update addresses a possible floppy drive problem for some users of the Macintosh IIsi, IIci, IIvx, IIvi, Quadra 700 and 950. The update eliminates possible problems encountered when ejecting disks during system shut-down.

It updates the Memory control panel to version 7.1.1 to improve performance in certain low memory conditions. This affects the Macintosh IIvx and IIvi, all PowerBook models, and all Macintosh Quadra models.

Future versions of System 7 will include these enhancements.

Features

- Includes Apple HD SC Setup version 7.2, which gives you more flexibility to format large Apple hard disks between 1 and 2 gigabytes. (Note: We recommend that you update your hard disk drivers and also update the version of this utility that is on your System 7.1 Disk Tools disk. See "Updating Apple Utilities" and "Updating Apple Drivers" below.)

- Includes Apple Disk First Aid 7.2, a utility that repairs damaged disks. This version contains a brand-new (differing greatly from the last, 7.1.1, release of Disk First Aid) user interface. (Note: We recommend that you update the version of this utility that is on your System 7.1 Disk Tools disk. See "Updating Apple Utilities" and "Updating Apple Drivers" below.)

- Includes MacCheck 1.0.3, a support utility that has previously only been placed on Performa and LC 520 computers at the factory. MacCheck creates a profile of your Macintosh computer, including:

  - The processor, memory, expansion cards, SCSI drives, keyboard, monitor, and so on.
  - The installed applications and system software on your startup drive.

  MacCheck also provides:

  - A general logic board test
  - A checker for corrupted directories and System files
  - A checker for duplicate System files

  (Note: We recommend that you update the version of this utility that is on your hard disk -- if you already have it. See "Updating MacCheck Utility" below.)

- Improves the reliability of high-speed modems and similar devices. This feature prevents infrequent system crashes and makes serial communications (for high-speed modems and similar devices) more reliable. Macintosh models affected: Macintosh LC, LC II, IIsi, IIvx, IIvi, Macintosh Classic II, Macintosh Quadra 900, and Macintosh Quadra 950.

- Improves the accuracy of the system's clock. This feature keeps the tick count accurate on the system clock. Macintosh models affected: Macintosh LC, LC II, IIsi, IIvx, IIvi, Macintosh Classic II, Macintosh Quadra 900, and Macintosh Quadra 950.

- Corrects problems ejecting floppy disks when the computer is shut down. This feature prevents disks from getting stuck in the floppy disk drive when the computer is shut down. (This feature adds a one second delay to the shutdown process to give the floppy disk drive enough time to eject the disk before the power supply shuts down.)

Macintosh models affected: Macintosh IIsi, IIci, IIvx, IIvi, Macintosh Quadra 700, and Macintosh Quadra 950.

- Corrects sound input problems after using Macintosh File Exchange on the Macintosh Color Classic. This feature restores sound input capability after you quit Apple File Exchange. Macintosh models affected: Macintosh Color Classic.

- Corrects problems you may have with SCSI devices. This feature prevents random failures reading information from SCSI (Small Computer Systems Interface) devices. Most users will be unaffected by this change. Macintosh models affected: Macintosh IIvx, vi, and LC III. (This correction only affects those computers with the new Zilog chip and some rare devices which use the slow one-byte read SCSI mode.)

- Updates the Memory Control Panel to version 7.1.1, which improves performance in certain low memory conditions. This feature fixes possible memory problems that occur while using large RAM disks with System 7.1. Users can restart their computers when RAM disks are set to 100% of memory. Macintosh models affected: Macintosh IIvx, IIvi, LC III, Macintosh Quadra 700, Quadra 900, Quadra 950, and all Macintosh PowerBook computers.

Installation

The Installer automatically determines what software the computer needs, if any. Follow these steps:

1) Open the Installer icon.
2) Click the Install button.
3) When you see a message that installation is complete, click the Restart or Quit button.

Updating MacCheck Utility

The MacCheck ƒ folder on the Software Utility Update 1.0 disk contains the latest version of the MacCheck application. This update is intended to permanently replace the copies of MacCheck that you may already have on your Macintosh hard drive.

Follow these steps to complete the updates:

1) Put the Software Utility Update 1.0 disk into your floppy disk drive.

2) Choose a folder on your hard drive to place MacCheck. If you're replacing MacCheck, please choose the folder where it currently resides. MacCheck is placed in the Applications folder on Macintosh Performa systems and in the Utilities folder on Macintosh LC 520 systems. If you are unsure whether you already have MacCheck, click on your hard drive icon, and then use the Find menu item in the File menu to search for "MacCheck".

3) Click on the MacCheck ƒ window to make it active, and then choose Select All from the Edit menu.

4) Click either icon in the MacCheck ƒ window and drag it on top of the icon of the folder on your hard drive that you wish to copy to, then release the mouse button. (Note: Both the MacCheck and the MacCheck dataFile icons should have moved to the selected folder. If only one icon moved, you can try to repeat steps 3 and 4, or drag the icon that didn't move from the MacCheck ƒ folder to the selected folder.)

5) If your Macintosh warns you that the files in your selected folder have the same names as the items that you are moving, click OK.

Updating Apple Utilities

The Utilities ƒ folder on the Software Utility Update 1.0 disk contains the latest versions of the Apple HD SC Setup and Apple Disk First Aid applications. These updates are intended to permanently replace the copies of Apple HD SC Setup and Apple Disk First Aid that come on your System 7.1 Disk Tools disk. Follow these steps to complete the updates:

1) Put the Software Utility Update 1.0 disk into your floppy disk drive. Then choose Eject Disk from the Special menu.

2) Put the System 7.1 Disk Tools disk into your floppy disk drive.

3) Click the Utilities ƒ window to make it active, and then choose Select All from the Edit menu.

4) Click either icon in the Utilities ƒ window and drag it on top of the icon for the Disk Tools disk, then release the mouse button. (Note: Both the HD SC Setup and the Disk First Aid icons should have moved to the Disk Tools disk. If only one icon moved, you can try to repeat steps 3 and 4, or drag the icon that didn't move from the Utilities ƒ folder to the Disk Tools disk.)

5) Your Macintosh warns you that the files on your Disk Tools disk have the same names as the items that you are moving. Click OK.

6) You will be asked to insert specific disks until the files are fully copied.

Updating Apple Drivers

The Macintosh Software Utility Update also contains a driver update for Apple hard disk drives. You should install the driver update on each Apple hard disk drive you own by following these steps:

1) With your computer off, insert the updated System 7.1 Disk Tools disk into your floppy disk drive. Now turn your computer on.

(Note: The Disk Tools disk should already be modified according to the six steps listed in "Updating Apple Utilities" above.)

2) Double-click the Disk Tools icon to open the disk.

3) Double-click the Apple HD SC Setup icon in the Disk Tools window.

4) Click the Drive button until the name of the hard disk you want to update appears as the volume name.

5) Click the Update button.

6) Repeat steps 4 and 5 for any other Apple hard disk drives you own.

7) Click the Quit button.

Article Change History:
27 May 1993 - Revised to explain that update only offered on high-density disks.
19 October 1993 - Added Features, Updating MacCheck, Apple Utilities and Apple Drivers sections.

System Enabler 111 (1.0.2) Problem (2/93)

Revised: 2/24/93
Security: Everyone

System Enabler 111 (1.0.2) Problem (2/93)

==========

Article Created: 22 February 1993

TOPIC -----

PowerBook 160/180 owners using System Enabler 111 (1.0.2) downloaded from Apple SW Updates on AppleLink, before 02-23-93, experience a crash upon restart if AutoRemounter was installed. The problem was due to the fact that the enabler was corrupted during the posting process.

DISCUSSION -----

Persons who installed System Enabler 111 (1.0.2) from the Express Modem Disk (1.0.1) don't experience the problem.

Solution: The 02-23-93 posting of System Enabler 111 (1.0.2) is OK.

StyleWriter II: PrinterShare & Not Enough Memory Message (11/94)

Revised: 11/11/94
Security: Everyone

StyleWriter II: PrinterShare & Not Enough Memory Message (11/94)

==========

Article Created: 9 March 1993
Article Reviewed/Updated: 11 November 1994

TOPIC ----------

I have a StyleWriter II and a Macintosh Centris 610. When I share the StyleWriter (using the GrayShare driver), I sometimes get a dialog box that says I do not have enough memory to share the printer. This problem always occurs if I shut down the Centris 610 after the printer is shared.

Also, after I shut down, the "Share this printer" checkbox becomes unchecked.

DISCUSSION ----------

This is a known bug in the PrinterShare v1.0 extension, and has been fixed in PrinterShare v1.0.1 and later. It occurs most frequently on 68040 systems (including the Macintosh Centris 610 & 650, and Quadra 800) because of the use of the CPU cache. However, this can also occur on other models given the right circumstances.

We suggest that any customer using the print sharing option on a StyleWriter II, upgrade the PrinterShare software to version 1.0.1 or later. In addition to upgrading the PrinterShare file, you should throw away the "Shared Prefs" file located inside the System Folder:

```
System Folder
   Preferences
      Printing Preferences
```

LaserWriter Pro & Windows: Printing to Legal Size Paper (3/93)

Revised: 3/24/93
Security: Everyone

LaserWriter Pro & Windows: Printing to Legal Size Paper (3/93)

==========

Article Created: 9 March 1993

TOPIC ----------

When I print legal-size documents to LaserWriter Pro 630 with Windows 3.1, it will not print the top three inches of the page. What causes this?

DISCUSSION ----------

Unless you insert a Universal 500-sheet cassette tray (set for legal paper) into a LaserWriter Pro, the printer assumes that any paper in the multipurpose/manual feed tray is letter size. When a document is printed, it is cropped to letter size and omits three inches of the document.

In the Macintosh environment, you can easily change the default paper size for the multipurpose tray with the LaserWriter Utility's "Paper Handling ..." menu item.

In the Windows environment, PostScript code has to be downloaded to the printer to change the default value. Below are the PostScript code segments to configure the multipurpose tray for letter, legal, A4 and B5 paper sizes. Once downloaded to the printer, this code will remain in effect even after the power is cycled.

The specific code segment to be used should be saved as a text file, and then downloaded using the COPY command:

COPY B:\TEXTFILENAME LPT1: [Enter]

where B is the drive name where the text file is located and where TEXTFILENAME is the name of the text file.

ABS Tech Note: DAL00 About DAL Tech Notes (11/93)

==========

Article Created: 30 November 1993

TOPIC ----------

This document accompanies each release of Apple Business Systems Technical Notes.

DISCUSSION ----------

We want Technical Notes to be distributed as widely as possible, so they are sent to all Partners and Associates at no charge; they are also posted on AppleLink in the Developer Services Bulletin Board and Tech Info Library.

We place no restriction on copying Technical Notes, with the exception that you cannot resell them, so read, enjoy and share. We hope Apple Business Systems Technical Notes will provide you with lots of valuable information.

Technical notes are a 'living' complement to product documentation, be it Inside Macintosh or other documentation. This means that they are updated on a regular basis, so as to be accurate and up to date. New Notes are added as required.

This technical note is an index of all technical notes related to the Data Access Language and related products. It also documents all changes to the technical notes since the previous release.

Revised: 9/3/93
Security: Everyone

ABS Tech Note: DAL01 VTAM Tuning (4/93)

==========

Article Created: 26 April 1993

TOPIC ----------

The following information can be used to help you obtain the best results for the DAL server for MVS/VTAM, Version 1.3.5.

DISCUSSION ----------

Calculating Storage Requirements (Region Size)

The DAL server for MVS/VTAM requires 892K of storage with no sessions connected. Each concurrent session requires a minimum of 260K when no work is being performed by the client. To calculate the region size to support the desired number of concurrent sessions for your environment, use the above figures and add twenty five percent for overhead. Example: ten concurrent sessions will require a region size (REGION= on job step) of 4365K. See below on the maximum number of sessions connected to a single server.

31-Bit Addressing and Maximum Number of Sessions

The DAL server for MVS/VTAM does not currently support 31-bit addressing. This means that the server cannot operate in a region size larger than 16M (i.e., “above the line”). Do not code a value greater than 16M on the “REGION=” parameter for the job step. Using the storage estimation procedure given above, the theoretical maximum number of sessions simultaneously connected to the server in a 16M region is 45. However, large queries will significantly reduce response time; it is better to limit the number of concurrent users to under 25, even for large region sizes. In addition, attempts to login more than several sessions simultaneously will require large amounts of memory for a short period of time; to avoid problems, it is best to ‘stagger’ the logins.

Multiple DAL server for MVS/VTAM on the Same CPU

More than one DAL server for MVS/VTAM can be run at the same time on a single CPU (given the limits of your environment). Using more than one server will allow for a greater number of concurrent sessions. If multiple servers are used, the client scripts (hosts.cl1 prior to System 7.0 and DAL Preferences under System 7.0) must reference the appropriate APPLID(s). To accomplish this, each server must have a unique VTAM APPLID assigned to it. You will not need to perform a complete installation for each APPLID (and its associated server) as the LOADLIB, AUTOEXEC, and Environment files may be shared between multiple servers. Refer to the “Data Access Language server for MVS/VTAM Installation and Operation Guide”, as well as to the appropriate IBM publications, for more information on VTAM APPLIDs and server files. Refer to the “Data Access Language server for the Macintosh Installation and User’s Guide” for more information on the hosts.cl1 (DAL Preferences) file.

Security

The DAL server for MVS/VTAM must be an authorized task on the host system in order to implement security (password) verification. Authorization procedures are explained in the “Data Access Language for MVS/VTAM Installation and Operation Guide” as well as the appropriate IBM publications. Use of third-party programs to bypass the normal authorization procedure (i.e., reference to the load module in a SYS1.PARMLIB member) is not supported by Apple, and results may be unpredictable.

Use of DB2 Threads

The DAL server for MVS/VTAM reuses the available threads within the host DB2 subsystem. Each concurrent session requires one thread, which is released upon completion of the database transaction (e.g., SELECT, COMMIT). The number of available DB2 threads is specified during installation of the DB2 subsystem. It is important to note that the Server uses ‘BATCH’ threads, as opposed to ‘FOREGROUND’ threads; verify that the number of batch threads will be sufficient to support the maximum number of concurrent users. Refer to the appropriate IBM publications for more information.

Tech Info Library Article Number:11628

ABS Tech Note: DAL02 VTAM Memory (6/92)

Revised: 9/3/93
Security: Everyone

ABS Tech Note: DAL02 VTAM Memory (6/92)

==========

Article Created: 30 June 1992

TOPIC ----------

The following information can be used to help you to plan and manage storage (memory) requirements for the DAL server for MVS/VTAM, Version 1.3.5.

DISCUSSION ----------

Limitations

The DAL MVS/VTAM Server does not currently support 31-bit addressing and thus cannot run above the 16M “line” on MVS. Therefore, when coding the REGION parameter in the server run JCL, a size no larger than 16M can be utilized. The actual amount of real memory available to the server (as an MVS address space) will depend on the host system tuning parameters and workload.

Server Component Memory Requirements

The base server requires 892K with no sessions connected. Each connected session utilizes a minimum of 260K. Actual session usage is dependent upon the number and size of the queries executed. For any given region size, a larger number of concurrent sessions will be possible when the query sizes are smaller. Conversely, large queries will limit the number of concurrent sessions. Therefore, the number of maximum concurrent sessions can vary for any given region size.

Avoiding Out-of-Memory Conditions

Beginning with Version 1.3.5 of the DAL MVS/VTAM Server, a memory verification is made before allowing a new session to connect. The server will check if a minimum of 300K is available for the new session. If a minimum of 300K is available, the session will be established. If less than 300K is available, an error message (F000000116) will be generated by

the host and the session will not be established. In addition, an error code of -10628(116) will be returned to the client. However, this verification does not prevent out-of-memory conditions for every situation. For example, several sessions may attempt to execute large queries at the same time, resulting in more than the available memory being requested.

Out-of-Memory Errors

If the server is unable to obtain memory when required by large queries and/or numerous concurrent sessions (as described above), the symptoms can be manifested by appearance of one or more of the following:

- Error message(s) logged as a result of a GETMAIN macro failure.
- The server abnormally terminates with MVS system code 0C4.
- Following one or more 0C4 abends, a 0C1 abend can occur if a third-party system dump analysis tool is installed.

Using the Trace Facilities

The trace facilities should not be enabled under normal circumstances. Severe degradation in server response time, as well as a decrease in available memory, will be observed if these facilities are in use. Comment out or remove the DD statement for DSNTRACE (if it is present) to ensure that tracing is not enabled. Using the “DD DUMMY” method of removing reference to this dataset will not be effective; it must be commented out or removed. For more information on the trace facilities, refer to Appendix A in the “Data Access Language Server for MVS/VTAM Installation and Operation Guide”.

ABS Tech Note: DAL03 VTAM Install Issues (6/92)

Revised: 9/3/93
Security: Everyone

ABS Tech Note: DAL03 VTAM Install Issues (6/92)

==========

Article Created: 30 June 1992

TOPIC ----------

This document should be used as a preinstallation tool whenever a final or evaluation copy of the DAL MVS/VTAM Server, Version 1.3.5 (or greater) will be installed. It will help you to verify release levels of key host software components, identify "traps" that can delay proper functioning of the server after initial loading and installation, and assist in identifying key support personnel.

DISCUSSION ----------

Required Host Support Personnel

The following host support personnel should be identified and included in the planning and installation of the server. In some cases, an individual can have responsibility for more than one of these functions.

- Systems Programmer
  This individual is generally responsible for the installation and maintenance of the base operating system (that is, MVS) as well as other IBM and third-party applications.

- Security Administrator
  He/she is responsible for all security-based activities on the host. This includes RACF or ACF2 administration, USERID maintenance, and so forth.

- Network Analyst
  This person is generally responsible for all network definitions including VTAM, NCP, LOGMODEs, and so forth.

- Database Administrator
  He/she is responsible for setting up and maintaining the host database subsystems (that is, DB2 or Teradata). Sometimes, the Database

Administrator needs to work with the Security Administrator when access to the database is being defined.

- Client Expert
  For the Macintosh, you should have at least one person who is familiar with Macintosh concepts, as well as experienced with installation of new applications. He/she will need to modify the preferences file ("host.cl1" for System 6, "DAL Preferences" under System 7) as well. For the MS/DOS PCs, someone familiar with the concepts and operation of DOS should be included in the installation and verification of the client-based software.

Key Components and Concepts

The DAL MVS/VTAM Server is designed to be used in conjunction with DAL for the Macintosh client to query, extract, and/or update DB2 or Teradata-based subsystems. The server does not replace these two subsystems or their utilities (such as SPUFI). DAL makes use of the existing security definitions set up in RACF (or ACF2) as well as those within DB2 or Teradata. Any changes to the security or database environments are made as before; DAL has no specific or unusual requirements.

The DAL MVS/VTAM Server and Security

Security on an MVS host with DB2 or Teradata is usually provided on two levels. The Systems Programmer usually manages system-wide resources (such as TSO, NetView, datasets, and so forth) using a security package such as RACF or ACF2. In addition, there is controlled access to data within the database subsystem itself; this is maintained by the Database Administrator. As user verification is performed during the logon sequence, the load module for the DAL Server must be installed in an authorized library on the host. Once installed, the server is then able to perform the system calls (RACINIT, RACROUTE) necessary to verify a USERID and password combination. The server only needs to perform these system calls during the logon sequence; no other supervisor calls are done by the server. In the event that the host system does not utilize RACF or ACF2, a sample exit is included with the product should customization be desired. This exit appears as member 'DALAUTH' with the RUN.JCL supplied on the product tape. Note that the sample only specifies the entry point and JCL necessary to relink the server's load module. Coding and logic for the exit can be designed and implemented by the customer to suit their individual shop requirements.

Host System Software Release Levels

Following are the recommended minimum release levels for installation of the DAL MVS/VTAM Server, Version 1.3.5. Although older versions of host software may be compatible with DAL, Apple has only tested using the following releases:

- VTAM: 3.2.0
- NCP: any release (with the necessary PTFs) that supports the installed level of VTAM

- MVS/XA: 2.2.0
- MVS/ESA: 4.2.0
- DB2: 1.3.0
- RACF, if applicable: 1.8.0
- ACF2, if applicable: 5.2
- CICS, if applicable: 1.7
- Teradata, if applicable: 4.1

Macintosh Software Release Levels

Following are the recommended minimum release levels for installation of the DAL Client, Version 1.3.5. Although older versions may be compatible, both Apple and the appropriate third parties have tested with the following releases:

- SNA•ps, using 3270 or APPC: 1.1. 3270 access requires version 1.1; version 1.0.1 may be used for APPC access only
- Avatar's MacMainframe: version 4.0.1
- DCA's MacIrma: DCA requires that MacIrma SNA, version 2.1.0 is used with its associated MacIrma DAL Driver, version 1.2.1
- DCA's HLLAPI version of MacIrma: DCA requires that MacIrma SNA, version 2.1.0 is used with its associated MacIrma API, version 1.4.0
- Tri-Data's Mac Netway 3270: Version 8.2 with Tri-Data API also at version 8.2
- Tri-Data's Mac Netway 3270 Advanced: Version 1.0.3 with Tri-Data API also at version 1.0.3 Miscellaneous Hint and Tips
- Use of third-party programs to bypass the normal authorization procedure (that is, reference to the load module in a SYS1.PARMLIB member) is not supported by Apple, and results may be unpredictable.
- If any of the user-supplied exits are utilized, the load module must be relinked and properly referenced in the run JCL. This includes support for National Languages, SMF processing, custom security, and so forth.
- If secondary AUTHIDs are used on the host system with DB2, verify that any user-coded exits are designed to work in a multiple subtask environment.
- Be sure to code and activate the VTAM APPL (ACB) for the server prior to attempting any connection from the client. The SRBEXIT parameter must be equal to 'NO' for use with DAL. Verify your system defaults to ensure that SRBEXIT=NO, or code it explicitly in the APPL major node.
- ACF2 installations must authorize the DAL MVS/VTAM Server as a multi-use task (MUSSAS). The SAF Rule should point to the module 'CL1HEAD'.

Preinstallation Software Version Checklist

The following checklist should be used to accurately verify the host system software release levels prior to installation, as well as identify key host support personnel. Questions or concerns should be forwarded to the appropriate support group within Apple before proceeding. This will ensure a quick and trouble-free installation.

	Release Level	Release Level

MVS/XA or MVS/ESA _____ VTAM _____

RACF or ACF2 _____ DB2 _____

NCP _____ CICS _____

Teradata _____

If there are any custom exits installed in the host system, they may affect the operation of DAL. Verify this information before proceeding with the installation of the MVS/VTAM Server:

Are there any custom exits installed for security? Y / N

Are there any custom exits installed for the database subsystem? Y / N

Name of Systems Programmer: _____

Name of Security Administrator: _____

Name of Network Analyst: _____

Name of Database Administrator: _____

ABS Tech Note: DAL04 Character Translation Tables (2/93)

Revised: 9/2/93
Security: Everyone

ABS Tech Note: DAL04 Character Translation Tables (2/93)

==========

Article Created: 26 February 1993

TOPIC

This document provides a technical description and overview of the character translation mechanism used (in the IBM environment) by Apple's Data Access Language Clients and Servers.

DISCUSSION

Purpose

Character translation is necessary whenever devices utilizing ASCII character representation will be communicating with devices that use EBCDIC character representation. Generally speaking, only the larger IBM hosts have operating systems that utilize EBCDIC, or where the character sets are interpreted differently between host and client. All others, including DOS-based PCs, represent characters in ASCII. The reasons why these code sets have developed in parallel will not be addressed within the scope of this document. It can simply be stated that some form of translation must occur if one device is to "understand" the other. Additionally, there are no requirements for where (that is, a physical location) this translation should take place.

DAL Internal Data Format and Host Translation

DAL uses an internal data format for communication between servers and clients. Use of this internal format allows DAL Clients to communicate with a variety of servers. The format is based upon IBM Code Page 850, an ASCII representation that is commonly used for PC to mainframe communications. (A 'Code Page' is the IBM term for a table that is used by applications and/or system software for some form of character translation.) Data to and from the Server is in ASCII and therefore requires translation to EBCDIC prior to being forwarded to the database

subsystem (for example, DB2). There are two internal tables to perform this task: one from ASCII to EBCDIC (inbound to the host) and one from EBCDIC to ASCII (outbound from the host). The two tables are mirror images of each other to ensure that data that is sent to the host and stored will be the same when it is retrieved at a later time by the client.

User Translate Tables

Two User Translate Tables are provided should any custom translation be desired. They have the same name in all DAL Servers for the IBM environment. For ASCII to EBCDIC, the table is named "UASC2EBC"; for EBCDIC to ASCII it is named "UEBC2ASC". Each table consists of 256 (from X'0' to X'255') storage constants in IBM 370 Assembler format. The Server utilizes these two user tables for translation in place of the default internal tables if they are present at linkedit time. Read "National Language Support" later in this document for more information on using these tables.

Macintosh Character Set

The character set on the Macintosh is ASCII-based. Apple uses the same internal representation for all Roman languages (as opposed to the Host Code Pages on IBM EBCDIC-based machines). Like the server, the client translates the Macintosh ASCII into DAL internal format prior to transmission towards the server. These client-based translation tables do not require any modifications when communicating to the IBM environment.

National Language Support

Starting with Version 1.3.8 of the DAL IBM Servers, Apple provides a macro that supports National Language characters. This macro is named 'DALLOCAL' and is stored as member 'DALLOCAL' in the RUN.JCL supplied with the product tape for the VTAM and TSO Servers. For the VM Server, this macro is stored in a file named 'DALLOCAL' with a filetype of 'ASSEMBLE'. This macro must be assembled and linked with the server load module; the output from the linkedit will be the new load module for the server. Sample JCL is included with the VTAM and TSO versions. For VM, use the standard assembler and add an 'INCLUDE DALLOCAL' statement in the linkedit control file (this control file is named 'LNKDAL' with a filetype of 'EXEC'). To support one of the languages included with 'DALLOCAL', remove the comment character and perform the assembly. Copies of the default (internal) tables are also included for reference or other desired customizations. If you wish to create your own tables, you will need a copy of Code Page 850 as well as the Host Code Page for your environment. Contact your authorized IBM representative for more information on Code Pages. Languages not present in the 'DALLOCAL' macro may be supported in a future release.

Please note that the entry point and included 'SYSLIB' module specified on the linkedit control cards are different for TSO and VTAM:

- For TSO, specify 'ENTRY CL1HEAD' and 'INCLUDE SYSLIB(DALSVR)'

- For VTAM, specify 'ENTRY STARTUP' and 'INCLUDE SYSLIB(DALSERVE)'

If you have changed the load module name of the server to something other than the default as shipped, you will need to reflect this change in the 'INCLUDE' card(s).

Internal Conversion of Characters by DB2 and SQL/DS

Some characters received by DB2 and SQL/DS will be converted to spaces (EBCDIC X'40') when stored on the host. These will be subsequently translated and received as spaces by the client. This is because the database subsystems will not store 'unprintable' characters such as those between X'00' and X'3F' in EBCDIC. If you encounter this situation, verify that you are sending the proper characters from the client.

National Language Support Considerations

Support of National Languages can be handled in the IBM environment on several levels. It is installation dependent as to whether any or all of the following modifications have been performed to support a National Language. Check first with the systems programmer responsible for the installation and maintenance of the host operating system before enabling National Language support within the DAL Servers; results may be unpredictable if there are any discrepancies.

Specific things to note:

- If a 3X74 Cluster Controller (for 3270-style terminals) is being used, a language support feature may have been generated within the cluster.

- Code Pages for the host operating system (for example, as MVS) may be installed.

- Localized versions of the host software (for example, TSO or CMS) may be installed.

For example, a Macintosh may have a French version of the system software installed; the DAL MVS/VTAM Server may have been relinked to support the French Code Page. However, if the Code Page on the host is not French, there will be some characters that do not display properly if viewed using a host-based utility (such as SPUFI under DB2). Characters sent from the Macintosh, stored on the host, and later retrieved for display on the Macintosh, will still display correctly due to the "mirror-image" feature of DAL's translation tables.

ABS Tech Note: DAL05 VTAM F-Messages (6/92)

Revised: 9/2/93
Security: Everyone

ABS Tech Note: DAL05 VTAM F-Messages (6/92)

==========

Article Created: 30 June 1992

TOPIC ----------

This document provides a description and reference list of the F-messages generated under certain error conditions when using Apple's Data Access Language Clients and the DAL MVS/VTAM Server, V1.3.5.

DISCUSSION ----------

Overview

During operation of the DAL MVS/VTAM Server, some conditions can occur that will generate an 'F-message'. These messages are related specifically to the operation of the server's subtasks or are used as a mechanism to pass back return codes from the system-level activities, such as the host security software (for example, RACF) during password authorization. F-messages are not issued for any errors that occur within the database subsystems, as each subsystem has its own suite of error codes.

F-Messages Generated by the Server

Each F-message that is generated by the server falls into one of the categories listed below. The majority of the F-messages are related to system security processing (such as password verification during logon). The other categories are:

- Errors received in 3270 datastream (3270 connections only). This means that an invalid or unexpected string was sent to the server while connected using 3270 protocols.

- Subtask abends. If the server detects an abend in the user subtask, an F-message will be generated to indicate that some unusual situation has occurred. Examine the host system logs for further information. These

can also be generated if the server itself is shutdown while sessions are still active.

- Memory allocation problems. If sufficient storage (memory) does not exist on the host for a new session to be started, one of these F-messages will be generated.

F-Messages Received by the Client

When an F-message is generated on the host, the numeric portion of the F-message will be returned to the client as a secondary error code. As an example, an APPC DAL session that uses "SNA•ps APPC" under System 7 and supplies an invalid password during logon receives an 'invalid password' return code from the system security package (for example, RACF). As a result, an F-message, 'F000000008 INVALID OR MISSING PASSWORD' is generated on the host. On the client, the error of '-10909 (8) SNApsAPPC (DAL Preferences)' is generated. The '(8)' portion of the error code relates to the 'F000000008' error message on the host.

Message Numbers and Text:

- Errors received in 3270 datastream (3270 connections only):
  F000000001 TERMINAL I/O ERROR

- Security-related errors:
  F000000004 UNAUTHORIZED OR MISSING USERID
  F000000008 INVALID OR MISSING PASSWORD
  F000000012 PASSWORD HAS EXPIRED
  F000000016 NEW PASSWORD IS INVALID
  F000000020 USER NOT DEFINED TO GROUP
  F000000024 RACINIT FAILED
  F000000028 ACCESS HAS BEEN REVOKED
  F000000032 RACF NOT ACTIVE
  F000000036 GROUP ACCESS REVOKED
  F000000040 OIDCARD REQUIRED
  F000000044 OID CARD INVALID
  F000000048 USER NOT AUTHORIZED FOR TERMINAL
  F000000052 USER NOT AUTHORIZED FOR APPLICATION
  F000000100 USERID IN USE

- Subtask abends:
  F000000104 SERVER TERMINATED ABNORMALLY
  F000000108 SERVER TERMINATED BY CANCEL
  F000000112 SERVER TERMINATED BY CLOSEDOWN

- Memory allocation problems:
  F000000116 INSUFFICIENT STORAGE FOR EXECUTION

ABS Tech Note: DAL06 Informix Host DB Location Specs (6/92)

Revised: 9/2/93
Security: Everyone

ABS Tech Note: DAL06 Informix Host DB Location Specs (6/92)

==========

Article Created: 30 June 1992

TOPIC ----------

This article is a Technical Note discussing Informix hose database location specifications.

DISCUSSION ----------

When using the "IN LOCATION" statement with some versions of Informix for VMS, the database location must contain a directory name enclosed in brackets [ ]. Using a logical that does not contain brackets will result in an error. This restriction does not apply to the 'USE LOCATION' statement, which allows the use of logicals without brackets.

```
open database 'daldemo' in location 'msad$system:';         -->  error

open database 'daldemo' in location 'sys$sysroot:[msad]';   -->  OK

use location 'msad$system';
open informix dbms;                                         -->  OK
open database 'daldemo';
```

With some versions of Informix for VMS, the Informix DBMS software is only able to open databases located in the current default directory. For these versions of Informix, the USE LOCATION method above must be used; the IN LOCATION method will produce an error message.

The first method is preferable, but if using the USE LOCATION statement, follow these guidelines to insure that the dbms will use the directory specified.

• Use the statement only once per session.

- Issue the statement before any "open dbms" or "open database" statement.

Note: Informix support in DAL has been discontinued in release 1.3.6, so this tech note is valid only for releases 1.3.5 and before.

ABS Tech Note: DAL07 NULL Values in GROUP BY (6/92)

Revised: 9/2/93
Security: Everyone

ABS Tech Note: DAL07 NULL Values in GROUP BY (6/92)

==========

Article Created: 30 June 1992

TOPIC ----------

This technical note describes differences in the way various DBMS brands handle NULL values when GROUP BY is specified in a query.

DISCUSSION ----------

The GROUP BY clause groups together rows that have identical values in a grouping column (or columns) and produces a summary row of query results for each row group. When NULL values occur in the grouping column, the results of the query may differ from one DBMS brand to another. Some DBMS brands, such as ORACLE, consider two NULL values to be identical for GROUP BY purposes and collect all rows with a NULL grouping column value into a single row group. Other DBMS brands, such as Informix, treat two NULL values as different values for GROUP BY purposes (in the same way that two NULL values are not considered identical when compared in the WHERE clause). These DBMS brands generate a separate row group for each row with a NULL grouping column value.

DAL accepts the query results as returned by the DBMS, so these differences between the DBMS brands are visible through DAL. If your application uses a query with GROUP BY and the grouping columns can contain NULL values, you should experiment with your particular DBMS brand to see how it will group the rows containing the NULL values.

ABS Tech Note: DAL08 DAL Size Limitations (10/92)

Revised: 9/2/93
Security: Everyone

ABS Tech Note: DAL08 DAL Size Limitations (10/92)

==========

Article Created: 30 October 1992

TOPIC ----------

This technical note describes certain size limitations inherent to DAL.

DISCUSSION ----------

DAL is designed so that it has no limits on the number of rows returned. DAL does have a limit of 255 on the number of columns in a rowset. With the current implementation of DAL (1.3) there are some limits on the transmission of data values to the client and fetching data from the DBMS. A single row fetch'ed or print'ed should not be greater than 2000 characters, and a single value fetched or printed should not be greater than 255 characters. DAL should not be used to fetch data from DBMS columns defined as VARCHAR or CHAR larger than 255.

As an example, you can have a table named offices with 200 columns, 20,000 rows and send the statement:

```
select * from offices;
printall;
```

All the data will be returned to your client as long as any single data value is not greater than 255 characters, and any single row has not more than 2000 characters (in this example with 200 columns the average column size for each row would have to be less than 10 characters; 200 columns * 10 characters = 2000 the limit). In actual use DAL may print data values and rows that exceed these limits; however, these limits should not be exceeded and you should not depend on them in your program.

Other limitations

Developers have periodically asked questions concerning the maximum size of

variables, transactions, and query results that DAL can handle. Below are the questions with answers:

Q: How many DAL statements can I send to the DAL Server at one time?
A: There is no limit to the number of DAL statements that can be passed to the DAL Server.

Q: How big can a single DAL statement be?
A: There is no limit to the size of a single DAL statement. There are certain limitations, however, the size of an Execute statement which passes its argument directly through to the DBMS's.

Q: How large can the command string be in an EXECUTE statement?
A: The command string can be as long as than 1000 characters, although this limit is system-dependent.

Q: How big can DAL query results be?
A:
- DAL does not support print'ing or fetch'ing VARCHAR or CHAR data values larger than 255 characters or bytes.
- DAL does not support more than 254 columns in a query result. Consequently, DAL commands such as SELECT cannot have more than 254 columns in a query.
- The maximum size for any row fetch'ed or print'ed 2000 bytes.

Q: Are there limitations on datatype conversions in DAL?
A: Yes, among the limitations you might run into are:
- You cannot convert INT to SMINT. The code:
  integer int1 = 100; smint smi1= smint int1;
  will return an error.
- You cannot convert a timestamp into a float or smfloat. The code:
  timestamp ts1=varchar dt1+" "+varchar tm1; smfloat smf1=smfloat ts1;
  will return an error.

ABS Tech Note: DAL09 Disk Space Usage on VAX/VMS (6/92)

Revised: 9/2/93
Security: Everyone

ABS Tech Note: DAL09 Disk Space Usage on VAX/VMS (6/92)

==========

Article Created: 30 June 1992

TOPIC ----------

This technical note describes user disk space considerations for DAL VAX/VMS Servers.

DISCUSSION ----------

DAL client users must have some disk space on the host server machine to run the DAL Server. When the user's host account has zero available blocks on the account's default physical disk, a DAL error message is generated during any data exchange request. The error message reads: "Error Creating Object."

If DAL user accounts are set up without default disk space, the system administrator can specify an alternative location for the DAL server to find (and use) free disk by defining the VMS logical CL1TEMPDIR.

This variable should be defined to the name of a directory, such as USER:[TEMP].

The DAL user must have read/write and delete permission for the directory.

ABS Tech Note: DAL10 DAL and Rdb (6/92)

Revised: 9/2/93
Security: Everyone

ABS Tech Note: DAL10 DAL and Rdb (6/92)

==========

Article Created: 30 June 1992

TOPIC ----------

This technical note discusses restrictions and limitations with DAL and Rdb.

DISCUSSION ----------

The Rdb DBMS adapter for the DAL Server is best viewed as a VAX/VMS C application which uses Rdb's Dynamic SQL interface to access Rdb databases. Accordingly, any DAL user who intends to access Rdb databases should ensure that his or her account is set up with the proper VMS privileges and quotas required by Rdb. DAL users should also note that any current restrictions or problems in Digital's Rdb and Dynamic SQL will also affect the DAL Rdb DBMS adapter.

For example, when Rdb performs arithmetic operations on floating point data types such as the SQL aggregate function AVG(), Rdb rounds any decimal result to a whole number. Consequently, DAL client queries containing aggregate functions on decimal or float datatypes will return rounded numbers when executed in Rdb.

Problem #1

Referring to multiple databases by dbaliasname (AuthID)

To support multiple Rdb databases, the DAL Server Rdb Database Adapter uses the DECLARE SCHEMA statement in Rdb's Dynamic SQL for each database opened. In Rdb, each database or schema is referenced by an "authorization identifier" or AuthID. DAL uses the dbaliasname specified in an OPEN DATABASE statement as the AuthID, or when a dbaliasname is not specified, the database name is used as the alias and AuthID by default. For example:

```
                                                dbaliasname    AuthID
  open database "sample";                          sample      sample
  open database "reservations" alias "test";        test        test
```

Normally, the DAL Server keeps track of the AuthID for you. However, if you mix normal DAL statements with Rdb statements (via the DAL EXECUTE IMMEDIATE statement), you may need to use the AuthID when referring to tables, views, and indexes or when using the Rdb SET TRANSACTION statement. When referring to tables by the dbaliasname in DAL, the correct syntax is:

```
               dbaliasname!table_name        sample!offices
```

Rdb uses a period (.) instead of an exclamation point "!" when referencing a table by the schema's AuthID:

```
               AuthID.table_name             sample.offices
```

(Note: DAL uses the period (.) to prepend an owner name to a table. For example, sample!mark.offices in DAL indicates the table offices owned by mark in the database whose dbaliasname is "sample".)

So, when using DAL's EXECUTE IMMEDIATE statement to set a transaction mode for a database or to reference a table, be sure to use the database's dbaliasname as the AuthID.

For example:

```
  open rdb dbms;
  open rdb database "daldemo" alias  test  in location "msad$system";
  execute immediate "create table small (text char(20))";
  commit;
  insert into test!small values ("xyz");
  execute immediate "update small set text = 'small fails'
          where text = 'xyz' ";
  rollback;
  insert into test!small values ("xyz");
  execute immediate "update test.small set text = 'test.small works'
          where text =   'xyz' ";
  commit;
```

Problem #2

Attempting to query directly against the Rdb System Relations occasionally fails. For example, the following query fails:

```
  SELECT RDB$RELATION_NAME FROM RDB$RELATIONS;
```

Explanation: When DAL is asked to do a query, it checks the syntax and content of the query statement to ensure that the columns and tables asked for exist in the database and to determine the data types of the results. Certain system relations contain columns with a "SEGMENTED STRING" data

type (seg_str). This data type is not supported in SQL interface for Rdb 3.xxx (but will be supported in Rdb 4.0). Even though the column queried is not of the type seg_str, DAL looks at the entire structure (column names, data types, and lengths) to check for correct syntax and content. In doing so, Rdb generates the following error code when it encounters a column with a seg_str: SQL-F-INVSSCONV, Invalid conversion for segmented string column RDB$VIEW_BLR.

WORKAROUND:
Use the execute statement to create a view that specifies the non-seg_str columns desired. Then use DAL to query the view. This way, the DAL server's table look-up won't stumble on columns with the data type seg_str. The following example does this:

```
  Execute immediate "create view temp as
          select rdb$relation_name from rdb$relations";
  commit ;                                    /* don't forget to commit */
  Select rdb$relation_name from temp;
```

ABS Tech Note: DAL11 Oracle 6.0 Workaround (6/92)

==========

Article Created: 30 June 1992

TOPIC ----------

This article describes a workaround for Oracle 6.0 with DAL.

DISCUSSION ----------

There is a problem in Oracle 6.0 which will not allow you to re-open an Oracle database in one DAL session. In other words, you cannot open, close, and then open the database again.

For example, the following sequence leads to an error from Oracle 6.0:

```
begin> open database 'daldemo' user 'scott' password 'tiger';
more> close database;
more> go
Execution begins...
Execution Completed Successfully

begin> open database 'daldemo' user 'scott' password 'tiger';
more>  go
Execution begins...
Error -10207 (-6203)  daldemo  ()
Message is "network", line 1 : Error during Connect - 6203
```

The problem will also occur after an unsuccessful attempt to open a database. For example, if you try to open a database with an invalid userid or password, subsequent attempts to open the database will fail.

The work-around to this problem is to end the current DAL session and begin a new one. The bug only occurs in Oracle 6.0 prior to release 6.0.34, not in version 5.1.

ABS Tech Note: DAL12 No Multiple Cursors, Teradata/Sybase (6/92)

Revised: 9/2/93
Security: Everyone

ABS Tech Note: DAL12 No Multiple Cursors, Teradata/Sybase (6/92)

==========

Article Created: 30 June 1992

TOPIC ----------

This article describes a feature of DAL that is not supported by Teradata and Sybase.

DISCUSSION ----------

There is one feature of Data Access Language that is not supported by Teradata and Sybase, which is the ability to have multiple cursors open at the same time. Since Teradata and Sybase do not support this feature, applications which utilize the multiple cursor feature will have to be aware of this constraint when accessing data from a Teradata or Sybase database.

ABS Tech Note: DAL13 DB2 and SQL/DS Views (9/92)

Revised: 9/2/93
Security: Everyone

ABS Tech Note: DAL13 DB2 and SQL/DS Views (9/92)

==========

Article Created: 30 September 1992

TOPIC ----------

This article describes the creation of a view within DB2 or SQL/DS that will return different table listings.

DISCUSSION ----------

It is possible to create a view within DB2 or SQL/DS that will return different table listings (for example, when using the 'Describe Tables' command within DAL) based upon authority GRANTed to a particular user ID.

To implement this, change the value of 'DESTAB=' in the DAL Environment file to equal 'CREATOR.VIEWNAME'. Then, have the database adminstrator create the following view using the standard SQL utilities (for example, SPUFI).

The following is an example for DB2:

```
create view CREATOR.VIEWNAME (tcreator, ttname)
     as select distinct creator, name
          from sysibm.systabauth a, sysibm.systables b
               where a.tcreator = b.creator
                    and a.ttname = b.name
                    and a.granteetype =  ' '
                    and a.grantee = user
```

For SQL/DS, replace 'sysibm' with 'system' in the above example.

ABS Tech Note: DAL14 Modems and DAL (10/92)

==========

Article Created: 31 October 1992

TOPIC ----------

This technical note discusses some limitations in using modems with the Asynchronous Network Adaptor on DAL and a workaround that can be used to remove those limitations.

DISCUSSION ----------

DAL's Asynchronous driver makes assumptions about the type of modem attached that causes it to work incorrectly with some modems. DAL can not be made to work with Telebit and other high speed modems because during the initialization it sends an "ATZ" and then immediately starts sending other initialization strings while the modem is still processing the reset (on a Telebit, it can take over a second for the "ATZ" to finish and the modem to start listening again).

It is possible to work around this limitation, however. The trick is to use DAL's log-on scripting capability to do the modem dialing. What you need to do is tell the Asynchronous network adapter that the system is hardwired, and then dial the modem as part of the log-on script, as though it were an extended log-on sequence.

This is an example of how to dial a modem manually. It should be used as a starting point, because different brands of modems have subtle operating differences that might require modification. This sequence has been tested on a Telebit T1600.

```
rem:: First ignore the modem definition in the async definition
anymodem:async:com1:2400:Noparity:8databits:2stopbits:Boxonxoff:128:NoModem
rem:: Now dial the number, first the start sequence, if this fails
rem::  try to Hang up the modem with the recover sequence.
rem::  After the recovery sequence, execute the connect sequence.
```

```
rem:: this is one line in the DAL Preferences file
anymodem:login:3tries:+++\mOK\sATH:600:2000:\s+++\w2\sATH\r\sAT\r\MOK:\sAT
V1\r\MOK:\sATDT2573813\r\w5\mCONNECT\r\Mgin\w2\u\r\P\Mword\p\r\P\m$
```

ABS Tech Note: DAL16 Running in Sys 6 Finder Environment (6/92)

Revised: 9/2/93
Security: Everyone

ABS Tech Note: DAL16 Running in Sys 6 Finder Environment (6/92)

==========

Article Created: 30 June 1992

TOPIC ----------

Under some circumstances, when using DAL under the Finder with System 6.0.X, DAL will not be able to allocate enough memory to operate properly.

DISCUSSION ----------

DAL is a Macintosh system driver that is installed by an INIT into the System Heap. As such, it has to compete for space with all other drivers. At installation time only a minimum amount of space is allocated to load the driver and its required storage. Space for a DAL session is allocated at CL1Init time. Since the size of the system Heap cannot be changed once the Macintosh is fully booted, there are times when there is not enough space in the System Heap to allocate another DAL session. This problem is not specifically a DAL problem. It is a problem that is common to all drivers that reside in the System Heap.

Possible solutions:

- The best solution to this problem is to run MultiFinder. Under MultiFinder each driver indicates how much space it requires in the "System Heap" and MultiFinder grows the System Heap accordingly.

- If is not possible to run under MultiFinder, then the next best option is to remove an unnecessary INIT from your System Folder. By removing the INIT the driver or other system extension will not get loaded at boot time and thus free up some space in the System Heap.

- There is a file on the DAL Install Disk called "DAL Finder Setup". It is in the "DAL Files" folder. Put this file into your System Folder and reboot. This INIT increases the size of the System Heap by the same amount that MultiFinder would for DAL.

- If none of the previous solutions are possible then as a last resort the "Boot Blocks" can be edited (with 3rd party tools) to allow for more space to be allocated for the System Heap.

ABS Tech Note: DAL17 INGRES Locking Issues (6/92)

Revised: 9/2/93
Security: Everyone

ABS Tech Note: DAL17 INGRES Locking Issues (6/92)

==========

Article Created: 30 June 1992

TOPIC ----------

This technical note describes special locking considerations when using DAL with INGRES.

DISCUSSION ----------

By default, INGRES provides "repeatable read" transactions. This means that during a single transaction, your application can repeat a DAL query two or more times and is guaranteed that the query results will be identical. Thus, no database changes made by other users during your transactions will be visible to your program. INGRES provides this high level of transaction integrity by locking the sections of the database that your query has accessed until your transaction ends with a COMMIT or ROLLBACK statement. During your transaction, no other user may update the locked portions of the database.

This default INGRES locking can reduce the amount of concurrent access to an INGRES database, especially when a transaction includes "think time" during which your program is waiting for user input. To increase concurrency, INGRES provides several locking parameters which can be set programmatically through the INGRES SET LOCKMODE statement. These excerpts from the INGRES SQL reference manual, pages 2-56 and 2-57, describe these parameters.

Description of lock modes:

SET LOCKMODE provides four different parameters to govern the nature of locking in an INGRES session:

- Level: This refers to the level of granularity desired when the table is accessed. You can specify any of the following locking levels:

page	Specifies locking at the level of the data page (subject to escalation criteria; see below)
table	Specifies table-level locking in the database
session	Specifies the current default for your INGRES session
system	Specifies that INGRES will start with page-level locking, unless it estimates that more than Maxlocks pages will be referenced, in which case table-level locking will be used.

- Readlock: This refers to locking in situations where table access is required for reading data only (as opposed to updating data). You can specify any of the following Readlock modes:

nolock	Specifies no locking when reading data
shared	Specifies the default mode of locking when reading data
exclusive	Specifies exclusive locking when reading data (useful in "select-for-update" processing within a multi-statement transaction)
system	Specifies the general Readlock default for the INGRES system

- Maxlocks: This refers to an escalation factor, or number of locks on data pages, at which locking escalates from page-level to table-level. The number of locks available to you is dependent upon your system configuration. You can specify the following Maxlocks escalation factors:

n	A specific (integer) number of page locks to allow before escalating to table-level locking. The default "n" is 10, and "n" must be greater than 0.
session	Specifies the current Maxlocks default for your INGRES session
system	Specifies the general Maxlocks default for the INGRES system

  Note: If you specify page-level locking, and the number of locks granted during a query exceeds the system-wide lock limit, or if the operating system's locking resources are depleted, locking escalates to table-level. This escalation occurs automatically and is independent of the user.

- Timeout: This refers to a time limit, expressed in seconds, for which a lock request should remain pending. If INGRES cannot grant the lock request within the specified time, then the query that requested the lock aborts. You can specify the following timeout characteristics:

n	A specific (integer) number of seconds to wait for a lock (setting "n" to 0 requires INGRES to wait indefinitely for the lock)
session	Specifies the current timeout default for your INGRES session (which is also the INGRES default)
system	Specifies the general timeout default for the INGRES system

Against the backdrop of these SET LOCKMODE parameters and options are the INGRES system defaults for each of the parameters:

```
  Level          dynamically determined by INGRES
  Readlock       shared
  Maxlocks       10
  Timeout        0 (no timeout)
```

If you select the system option for any of the SET LOCKMODE parameters, the values above are automatically supplied. When you begin your INGRES session, the INGRES system defaults are in effect. If you override them with other values using the SET LOCKMODE command, you can revert to the system defaults easily.

Similarly, if you set session parameters (such as locking behavior for all user tables accessed by queries in your INGRES session), you can further set parameters for individual tables on an ad hoc basis. After setting the ad hoc locking behavior, you can return it to either the session defaults or to the INGRES system defaults.

INGRES tries to place a lock on every page it touches in a transaction. Depending on the Lockmode, this will lead to an exclusive, shared, or no lock condition on the page. INGRES also escalates locks (as with more than "Maxlocks," the whole table will be locked to prevent deadlocks). The default Lockmode in INGRES is shared. This means that several users can share the same page for "selects," but updates or inserts cannot take place until the page is held only by the updating user. If a user performs a "select * from xxx" type of query, then every physical page in the table is marked and the locks are not removed until the transaction is finished. This prevents other users from making updates to the same table. Concurrency will therefore be reduced.

However, concurrency is only an issue when there are write operations performed on the database on-line (as with updates or inserts). If no updates are going to take place in your application, you should use the "nolock" mode.

If you know in advance that your application will not be updating data in a transaction, it can use the "nolock" mode to eliminate the need for INGRES to lock parts of the database accessed by a query. Here is an example of a DAL sequence that uses this technique:

```
  /* Open INGRES for "select" and non-updating operations only: */
  open INGRES dbms;
  open INGRES database "cl1demo";
  execute in INGRES "set lockmode session where readlock = nolock";
  select * from offices;
  [continue with session]
```

If you do not want to turn off locking, you can still improve concurrency in a query-only application by making sure that a COMMIT statement is executed as soon as you have finished processing each set of query results. Do not perform two or more queries in sequence without an intervening COMMIT statement unless your application absolutely depends on there being no changes to the database between the queries.

Finally, if your application must update the database, it should avoid "think" periods during a transaction that locks the database whenever possible. For example, this statement sequence will work correctly when the lockmode is shared or exclusive, but may lock large parts of the database during the "think time:"

```
  select (my_columns) where bool_expr;
  /* think and make changes */
  update (my_columns) where bool_expr;
  commit;
```

An alternative approach that will improve concurrency is:

```
  /* Do the query the first time without locking */
  execute in INGRES "set lockmode session where level = system,
          readlock = nolock";
  select (my_columns) where bool_expr;
  printall;
  /* application puts data in buffer #1 */
  /* think and make changes and store updates in a buffer #3 */

  /* Turn on locking and do the query a second time */
  execute in INGRES "set lockmode session where level = page,
          readlock = exclusive";
  select (my_columns) where unique_id;
  printall;
  /* application puts data in buffer #2 */

  /* If data remains unchanged from first query, do the update */
  if buffer2 == buffer1 {
      update (my_columns)  where unique_id;    /* using contents of buffer
  #3 */
     commit;
  }
  else
  {
      /* warn the user that the data has changed since last select */
  }

  /* Turn locking back off again */
  execute in INGRES "set lockmode session where level = system, readlock =
  nolock";
```

The "unique_id" can be, for example, the employee number or another identifier that uniquely identifies the rows to be updated. The objective in an update process is to "touch" as few pages as possible, since all touched pages will be locked until the transaction commits. The reason for going through this lengthy process is to avoid having a page locked up for a long time.

ABS Tech Note: DAL18 Rdb Locking Issues (6/92)

Revised: 9/2/93
Security: Everyone

ABS Tech Note: DAL18 Rdb Locking Issues (6/92)

==========

Article Created: 30 June 1992

TOPIC ----------

This technical note discusses issues involving DAL performance that are specific to the Rdb database on VAX/VMS.

DISCUSSION ----------

DAL provides a model for specifying the type of "protection" or "locking" desired when using a database or specific table. Both the OPEN DATABASE and OPEN TABLE statements allow for update modes (READONLY/UPDATE) and sharing modes (SHARED/PROTECTED/EXCLUSIVE). The default mode is UPDATE and PROTECTED. Typically this would mean that the user has a "READ/WRITE" lock on the particular table or database. The sharing and update modes are advisory and are passed on to the DBMS only WHEN APPROPRIATE.

Rdb provides a some what different model for specifying protections that does not map well with the DAL model. Rdb uses an extension to SQL transactions — the SET TRANSACTION statement — to signal the type of locking mechanism desired for that transaction. SET TRANSACTION modes are not persistent across subsequent transactions; they must be specified at the beginning of each new transaction or the default mode of "READ WRITE" and "SHARED" will be used.

DAL update and shared modes are not transaction based; that is, in the DAL model, update and shared modes are "global" session modes and are independent of beginning and committing sessions. Consequently, when a DAL user opens a Rdb database or table, specifying a particular update or shared mode, the Rdb transaction modes are not changed. The DAL Server does not alter the Rdb transaction modes because they can not be changed in the middle of a Rdb transaction. One would have to commit the current transaction and begin a new transaction, setting the transaction modes as desired.

There are two possible problems:

Problem: Lock Conflicts caused by inserts and updates while using the Rdb default transaction modes.
Solution: Commit as early and often as possible. Generic DAL applications should commit often to free any locks against tables and indexes accessed. Otherwise, other users might be locked out of one or more tables.

Problem: User wants to specify READ ONLY to prevent locking.
Solution: Applications tailored to Rdb can explicitly begin new transactions with the desired locking and update modes by using the Rdb SET TRANSACTION statement via the DAL EXECUTE IMMEDIATE statement. Below are examples:

```
open rdb dbms;
open rdb database "daldemo";
execute immediate "SET TRANSACTION READ ONLY;" in Rdb;
...queries....
commit;               /* ends this transaction with READ ONLY */
insert into ....
commit;
```

ABS Tech Note: DAL19 CL1Init XCMD (6/92)

Revised: 9/2/93
Security: Everyone

ABS Tech Note: DAL19 CL1Init XCMD (6/92)

==========

Article Created: 30 June 1992

TOPIC ----------

This technical note describes clarifies the "Data Access Language Programmer's Reference" for CL1Init XCMD.

DISCUSSION ----------

The documentation in the "Data Access Language Programmer's Reference" indicates that the CL1Init XCMD "parallels" the CL1Init API. This is true except during error processing. If an error is encountered by the CL1Init XCMD, the XCMD will call CLGetErr and CLEnd before returning to HyperCard. The error information that the XCMD gets from CLGetErr is returned to HyperCard in the CL1 globals as defined in the "Data Access Language Programmer's Reference."

ABS Tech Note: DAL20 DAL, System 7 And The A5 World (6/92)

Revised: 9/2/93
Security: Everyone

ABS Tech Note: DAL20 DAL, System 7 And The A5 World (6/92)

==========

Article Created: 30 June 1992

TOPIC ----------

This technical note describes how the A5 world and the GrafPort have to be set up before calling DAL in the System 7 environment.

DISCUSSION ----------

The A5 world (an applications global data area) and the GrafPort have to be set up before calling DAL in the System 7 environment. In most cases (that is, when writing an application) this is a standard part of the initialization sequence; but there are environments where this is not true. An example of one such environment is an MPW tool. MPW sets up A5 but does not initialize the GrafPort, so the tool itself has to set up the GrafPort by calling InitGraf.

The following is an example of how to initialize the GrafPort under MPW:

```
  ...
  #define grafSize  206
  #include <quickdraw.h>

      char QD[grafSize];
    int sesnum;        /* this app's current session # */
    long sessid;        /* the current DAL session id */
    char hostname [80],
           username [80],
           password [80],
           connectionInfo [80];
    int status;

  Routine ()
  {
```

```
  ...
     InitGraf(QD);       /* Set up the GrafPort. */
  ...
     status = CLInit (&sessid, hostname, username, password,
  connectionInfo);
  ...

  }
```

ABS Tech Note: DAL22 DAL Under VM/XA and VM/ESA (9/92)

Revised: 9/2/93
Security: Everyone

ABS Tech Note: DAL22 DAL Under VM/XA and VM/ESA (9/92)

==========

Article Created: 30 September 1992

TOPIC

This technical note describes special actions necessary when installing the DAL Server in a VM/XA or VM/ESA environment.

DISCUSSION

Certain actions are necessary when installing the V1.3.5 of the DAL Server in a VM/XA or VM/ESA environment. This is because these versions of IBM's VM Operating System do not support the SQL/DS 'attach to database' command. In order to use DAL in these environments, perform the following actions:

- Update the 'ENV DAL' file to specify '@SQL' in the 'SSID=' statement. This will facilitate the use of commercial applications with DAL in a VM/XA or VM/ESA environment.

- If you are entering DAL commands directly (that is, via IDAL) or creating your own application, open the database by issuing the DAL statement 'open database;'. Do not specify a database name.

Note that VM/XA and VM/ESA are not supported by DAL 1.2 or earlier.

ABS Tech Note: DAL23 SELECT FOR EXTRACT Shadow Files (12/92)

Revised: 9/2/93
Security: Everyone

ABS Tech Note: DAL23 SELECT FOR EXTRACT Shadow Files (12/92)

==========

Article Created: 23 December 1992

TOPIC

This technical note describes using the SELECT FOR EXTRACT construction under DAL.

DISCUSSION

When using the SELECT FOR EXTRACT construct under DAL, DAL stores the data for the cursor in a temporary file on the host. If the permissions to the directory where this is stored are incorrect, it's possible for DAL to return an error (for instance, "-10101 can't open object").

The location these files are stored in can be determined using the following information.

- Under A/UX, the shadow filename is constructed as follows:

    DALTEMPDIR/dal%d%d.out

  where the first %d counts up from 1 and the second %d is the process id.

  DALTEMPDIR is set in /etc/dalrc and is usually /tmp, although the user may change it.

- Under VAX/VMS, the filename generated is:

    DALTEMPDIR:mpx%dXXXXXX.out

  where %d counts up from 1 as above, and XXXXXX is replaced by a number generated by the mktemp() vax system call, and the directory is determined by the DALTEMPDIR logical.

- Under MVS, the shadow filename is constructed as follows:

  ```
  userid.HOSTDAL.OUT.DT%d%t.F%n
  ```

  where %d = two digits for the date (01-31 inclusive), %t = four digits for the time (0000-2359 inclusive) and %n = three digits for the file sequence number (beginning with 001 and incrementing one for each additional file produced per job or task). The userid will be one of the following, depending on how the DAL Server was accessed: (a) the TSO USERID when using the DAL TSO product, (b) the USERID that logged on to the DAL VTAM Server when the VTAM Server is run as a started task (STC), or (c) the USERID of the submitter when the VTAM Server is run as a batch job.

- Under VM, the shadow filename is constructed as follows:

  ```
  DAL%n TEMPFILE *
  ```

  where %n = five digits for the file sequence number (beginning with 00001 and incrementing one for each additional file produced per session). TEMPFILE is the CMS filetype and * indicates that the file will be created on the user's 'A' disk.

- On the AS/400, temporary files are created in the user's temporary library "QTEMP" with the filename "DALTPxxx" where xxx is an ascending integer.

ABS Tech Note: DAL24 WRITE Failures After Client Reboot (12/92)

Revised: 9/2/93
Security: Everyone

ABS Tech Note: DAL24 WRITE Failures After Client Reboot (12/92)

==========

Article Created: 23 December 1992

TOPIC ----------

This technical note describes using the DALNET MacTCP network adaptor to talk to an A/UX DAL server, and what happens and workaround if the client system crashes.

DISCUSSION ----------

When using the DALNET MacTCP network adaptor to talk to an A/UX DAL server, if the client system crashes it is possible for the host to not recognize the closing of the session. If this happens, pending transactions are not committed and locks that have been created are not cleared.

This problem will show up with the following symptoms: after reboot, a client can connect to the server and do reads of the database but attempts to write will fail, and attempts to delete records will hang indefinitely.

The only workaround at this time is to manually log onto the A/UX server, locate the processes of the original connection and terminate them. This problem will be resolved permanently in a future release.

ABS Tech Note: DAL25 DB2 and Secondary AUTHIDs (12/92)

Revised: 9/2/93
Security: Everyone

ABS Tech Note: DAL25 DB2 and Secondary AUTHIDs (12/92)

==========

Article Created: 23 December 1992

TOPIC

This Tech Note explains what actions are necessary to implement DAL using secondary AUTHIDs, a facility of DB2. Secondary AUTHIDs are utilized in conjunction with a system resource security package (for example, RACF) to simplify access to tables under DB2.

DISCUSSION

Information on DB2 modifications necessary to support secondary AUTHIDs should be obtained from the relevant IBM publications. Similarly, more information on security procedures and strategies (such as GROUP definitions with RACF) can be found in the related IBM or third-party publications.

Why secondary AUTHIDs might be used

Secondary AUTHIDs are generally implemented in large IS environments where there are many users that require access to multiple tables in DB2. Although a GRANT could be done for each user/table combination, it is easier to assign users to different groups within the security software and then GRANT table access to the groups, as opposed to the users. For example, there might be fifteen users who all work in the accounting department that require identical access to a DB2 table. All fifteen users can be 'connected' to a group named 'ACTG' within RACF and then the necessary access can be GRANTed (using SPUFI or other DB2 utilities) to 'ACTG'. This way, if more people are added to the accounting department, they only have to be 'connected' to the group within RACF; no other GRANT would be necessary.

How DAL implements secondary AUTHIDs

Since DAL is not used for GRANTing access to tables or performing any system security functions, it can only take advantage of those accesses that are already in place. To do so, the database open must be performed with the 'as user <username>' option. This should be done right after opening the DBMS. An example is shown on the next page.

The DBMS and database are opened without usage of secondary AUTHIDs. The USERID that was utilized to logon to the DAL MVS/VTAM Server is 'RJOHNSO'.

```
DAL> open DB2 DBMS;
DAL> open database 'DB2T' ;
```

A selection is performed against a nonexistent table. The error generated indicates that the USERID was prepended to the query.

```
DAL> select * from foo;
••••Remote DAL Error••••
•Error:
undefined table name in database (-10204) table not found in database
"network", line 1 :
DSNT408I SQLCODE = -204, ERROR:  RJOHNSO.FOO IS AN UNDEFINED NAME
DSNT415I SQLERRP = DSNXOCA SQL PROCEDURE DETECTING ERROR
DSNT416I SQLERRD = 500  0  0  1  0  0 SQL DIAGNOSTIC INFORMATION
```

The database is closed and reopened using a secondary AUTHID that either does not exist or of which 'RJOHNSO' is not a member.

```
DAL> close database;
DAL> open database 'DB2T' as user 'DALPROD' ;
••••Remote DAL Error••••
•Error:
database not opened (-923) DB2T
"network", line 1 :
DSNT408I SQLCODE = -553, ERROR:  DALPROD SPECIFIED IS NOT ONE OF THE
VALID AUTHORIZATION IDS
DSNT415I SQLERRP = DSNXRST SQL PROCEDURE DETECTING ERROR
```

The database is now opened using a valid secondary AUTHID, and a selection is again performed against a nonexistent table. This time, however, the error message indicates that the secondary AUTHID is now prepended to all queries.

```
DAL> open database 'DB2T' as user 'DALTEST' ;
DAL> select * from foo;
••••Remote DAL Error••••
•Error: undefined table name in database (-10204) table not found in
database
"network", line 1 :
DSNT408I SQLCODE = -204, ERROR:  DALTEST.FOO IS AN UNDEFINED NAME
DSNT415I SQLERRP = DSNXOCA SQL PROCEDURE DETECTING ERROR
DSNT416I SQLERRD = 500  0  0  1  0  0 SQL DIAGNOSTIC INFORMATION
```

If the table 'DALTEST.FOO' actually existed, a query would have been

performed against it even though the USERID that logged on to the server is 'RJOHNSO'.

Verifying DB2 service levels

If V2.2.0 of DB2 is being used, it is important to verify the application of a PTF from IBM. This PTF, number UN23430, is specifically related to the use of secondary AUTHIDs with DB2. Contact your authorized IBM service representative for more information.

DAL Message H000020IPa (2/93)

Revised: 3/8/93
Security: Everyone

DAL Message H000020IPa (2/93)

==========

Article Created: 24 February 1993

TOPIC ----------

I am using Blythe client Omnis 7 1.1 to connect to a DAL VTAM Server 1.3.5.

I issue DALSVR PKT3270 user pswrd and get the proper response:
H00415dbx 1760

Then, anything else I type: (begin, open dbms) gets message:
H000020IPa

DISCUSSION ----------

The "dalsvr pkt3270 user password" command was documented in the installation guide to allow people to verify the VTAM server installation without having to rely on making a valid DAL Preferences script and connection from a Macintosh.

However, immediately following the detail on how to enter that command (and what you should see as a response) is the statement "Press PF3 to exit the server and return to the VTAM splash screen."

That final statement is there because it is impossible to communicate to the server directly. You can fake it into accepting the session, but you cannot actually "speak" to it as it thinks that it is talking to the DAL client and they converse in ASCII and a "DAL code".

In essence, when you tried to say "open dbms..." to the server it said: "I don't know what you're talking about -- I'm terminating this session!!"

So you can't do anything more than is documented in the install guide. You will have to use an application (Omnis) or the DAL Tester to actually access the DBMS and obtain data.

Centris: Performance Questions (5/93)

Revised: 5/17/93
Security: Everyone

Centris: Performance Questions (5/93)

==========

Article Created: 12 May 1993

TOPIC ----------

Is there any known or measured performance difference in using Excel or other math intensive applications on a Macintosh IIci and on a Centris 610? Is there any compatibility issues with the Centris 610, since it does not have a floating point unit (FPU)?

Can you provide me with some sort of a benchmark or comparison chart that compares the Macintosh IIci, Macintosh Centris 610 & 650, and Quadra 700 & 800? The product introduction materials only show overall system performance.

DISCUSSION ----------

Product Marketing sent me with the following information. The testing for these comparisons was done as "application-level benchmarks":

    Centris 610 is up to 2 times faster than a Macintosh IIvx/IIci
    Centris 650 is up to 3 times faster than a Macintosh IIvx/IIci
    Centris 650 is 30% faster than a Centris 610
    Quadra 800 is 25% faster than a Centris 650

When asked specifically about the possibility of upgrading the 68LC040 (no FPU) to a 68RC040 (includes FPU), they responded that, "This is neither endorsed nor recommended by Apple, and will not be an Apple offering." They speculate that some enterprising third party might offer such an upgrade kit in the future, but they do not know of one now.

Since it has no FPU, the Centris 610 would require applications that are not dependent on the presence of an FPU for compatibility reasons.

While performance could be expected to be slow on the Centris 610 for a

very math intensive application it is expected that the Centris 610 would still be somewhat faster than the Macintosh IIci.

If your customer wants specifics about performance, Speedometer is a public domain tool which provides performance comparisons. On America OnLine is an article that gives a detailed comparison of a number of CPUs including the Centris 610/650 and Quadra 700/800/950. That comparison table is included here in the hope that it will answer your customer's need.

---------- Article from America OnLine ----------

Here are Speedometer 3.11 numbers for some new machines. Also included are performance numbers for the Macintosh IIvx, Quadra 700 & 950 for comparison purposes. The Apple 1 gigabyte hard disk was used for all machines. The LC III had an FPU installed, the Centris 650 had a 68040, not a 68LC040 (that is, it had a hardware FPU), and the Centris 610 used a 68LC040 (in other words, no FPU). An Apple 14-inch color display was used on all machines. The disk cache was set to 256K on all machines.

Security: Everyone

Apple II: Information Sources (2/97)

==========

Article Created: 25 February 1993
Article Reviewed/Updated: 17 February 1997

TOPIC ----------

This article describes some information sources for the Apple II products.

DISCUSSION ----------

GS+

An Apple IIGS magazine published bimonthly by EGO Systems.

EGO Systems
P.O. Box 15366
Chattanooga, TN 37415-0366

A+/InCider

An Apple II and Macintosh magazine published monthly by IDG.

IDG Communications/Peterborough, InCider
P.O. Box 50358
Boulder, CO 80321-0358

A2-Central

Publishes a number of newsletters that are devoted to the Apple II only.
Here's the current list:

A2-Central

Published monthly since January, 1985 and provides technical information on the Apple II.

A2-Central on Disk has been published monthly since February, 1989. Each 800K

3.5-inch disk contains the full text of that month's paper issue, plus text-talking software for blind subscribers. In addition, specific issues contain Apple system software, technical note updates, public domain and shareware software.

Studio-City

Published every other month since February, 1990. Each issue consists of two 800K 3.5-inch disks and includes a HyperStudio stack containing editor Terry Baker's tips, tricks, and letters from readers.

TimeOut-Central

Published every other month since September, 1990. Each issue consists of one 800K 3.5-inch disk and includes a column by the editor, letters from readers, as well as public domain and shareware AppleWorks and TimeOut files.

Script-Central

Published bimonthly and is all about Apple's HyperCard IIGS and HyperTalk, its scripting language.

A2-Central
P.O. Box 11250
Overland Park, KS 66207

The Road Apple

An Apple II "End Users" Underground Newsletter published six times a year.

Al Martin
1121 NE 177th, Suite B
Portland, OR 97230.

Scarlett

A monthly newsletter published by:

Big Red Computer Club
423 Norfolk Avenue
Norfolk, NE 68701.

AppleWorks Forum

A monthly newsletter published by:

The National AppleWorks User Group
Box 87453
Canton, MI 48187

HyperStudio Network

A quarterly newsletter about HyperStudio. They publish an annual 'Best of HyperStudio' disk of stacks, and have discounts on HyperStudio accessories. They also have some teacher-oriented materials.

HyperStudio Network
Box 103,
Blawenburg, NJ 08504

Softdisk and Softdisk GS

Monthly disk magazines containing a variety of software (public domain, shareware, clip art, reviews, etc.). Softdisk is available on 5.25- or 3.5-inch disks. Softdisk GS is available only on 3.5-inch disks.

Softdisk Publishing
P.O. Box 30008
Shreveport, LA 71130-0008
AOL: zak Internet: zak@aol.com

USUS

An international non-profit organization dedicated to promoting and influencing software standards to aid in the development of portable software. They have a large software library including a lot of source code (for almost every language or computer).

USUS Inc.
P.O. Box 1148
La Jolla, CA 92038

PowerBook Duo: Not Retaining Network Selections (1/97)

Revised: 1/29/97
Security: Everyone

PowerBook Duo: Not Retaining Network Selections (1/97)

==========

Article Created: 19 January 1993
Article Reviewed/Updated: 29 January 1997

TOPIC ----------

I find that my PowerBook Duo is not retaining its network connection information when it is ejected from the Duo Dock, used, and reinserted back into the Duo Dock. I have an Ethernet connection to the Duo Dock, but the PowerBook Duo defaults back to LocalTalk connection when reinserted into the Duo Dock.

Shouldn't the Duo remember the network selection when it is reinserted into the Dock?

DISCUSSION ----------

A PowerBook Duo may not retain its network connection information when it is ejected from the Duo Dock, used, and reinserted back into the Duo Dock. The problem is related to the version of the Network control panel currently installed.

When the Network Software Installer (NSI) is used to install network software, the Network control panel is replaced. The NSI 1.2.3 disk installs Network CDEV version 2.3.3, which remembers the network setting. The NSI 1.3 disk installs Network CDEV version 3.0, which does not remember the network selection. The Network CDEV version 3.0.2 (from System 7.5, or NSI 1.4.4 and later) remembers the network connection of the Duo Dock when the Duo is re-inserted.

The problem can be worked around by drag copying the 2.3.3, or the 3.0.2 version of the Network CDEV to the Control Panels folder on the Duo.

You can obtain versions of the Network Control Panel which retain the network settings from the following locations:

Network Control Panel v.2.3.3

- System 7.1

- Network Software Installer 1.2.3
- Online services

Network Control Panel v.3.0.2

- System 7.5
- Network Software Installer 1.4.4
- Online services

This problem has been corrected in System 7.5, and the Network Software Installer v1.4.4 and later.

If you are using System 7.5.2, there are no known workarounds to this problem at this time. If you are using System 7.5.3 (System 7.5 Update 2.0), this problem may behave differently depending on whether you're using Open Transport or Classic AppleTalk:

*If Classic AppleTalk is the selected networking, there is no way around the problem at this time.

*If Open Transport is the selected networking, the problem occurs if the PowerBook is put to sleep while it is outside of the dock. The problem also occurs with saved configuration settings. That is, a configuration setting with the Printer Port selected for AppleTalk will revert to Modem Port when the Duo is re-docked. There may be other instances when network settings change.

Apple is currently investigating this problem and hopes to have it fixed in a future system update.

This article was published in the "Information Alley":
Volume II, Issue 11, Page 10

Article Change History:
29 Jan 1997 - Updated with additional Open Transport information.
16 May 1996 - Updated for Open Transport and System 7.5 Update 2.0.
29 Sep 1995 - Added Info Alley information; updated article.

PowerBook Duo, Duo Dock, Token Ring and NSI 1.3 (8/93)

Revised: 5/31/94
Security: Everyone

PowerBook Duo, Duo Dock, Token Ring and NSI 1.3 (8/93)

==========

Article Created: 26 February 1993
Article Reviewed/Updated: 23 August 1993

TOPIC -----

I am evaluating the PowerBook Duo and Duo Dock to purchase, but I won't make a purchase decision until I'm assured that the Apple Token Ring 4/16 NB card will work in them.

DISCUSSION -----

We can assure you that the Duo and Due Dock work properly with the Token Ring 4/16 NB card. We have run TokenTalk and SNA•ps clients over them without problem, When installing TokenTalk drivers be sure to use Network Software Installer (NSI) 1.3.3 or higher which resolves some problems with earlier versions of NSI.

If you are using an earlier version of NSI, there are some VERY IMPORTANT CAUTIONS to guarantee proper operation. Below is a list:

- Install TokenTalk drivers from the System 7.1 disks included with the Duo.

- Keep the Network Control Panel that comes with System 7.1 disks. With this version of the Network CDEV, the Duo will remember its Token Ring connection in the Dock when it's returned after being started up outside the Dock.

- DO NOT EVER use NSI 1.3 with the Duo and Duo Dock. It's not supported on this machine because it alters the Network Control Panel to version 3.0, which forgets network attachments, and it confuses the Duo AppleTalk version.

- DO NOT EVER use NSI 1.2.1, which comes in the box with the Token Ring 4/16 NB card. We've had issues with the Duo, Dock, and Token Ring 4/16 NB card when using NSI 1.2.1. The root cause was the System file being

corrupted while installing Token Ring drivers from NSI 1.2.1. There was also an issue of having older versions of third-party INITs installed as well.

- Install the Token Ring 4/16 NB card in the Dock slot which is farthest from the metal case, or the slot located more in the center of the Dock (there are two slots). The Token Ring 4/16 NB card is quite high with the IBM Token Ring chip set installed, and if the card is placed in the lower slot, the chip set touches the metal chassis thus potentially grounding out parts of it.

- Do not recommend installing other cards with the Token Ring 4/16 NB card. The slots are very tight and the Token Ring 4/16 NB card is very wide. We had trouble getting an Apple Ethernet NB card in the Dock with the Token Ring 4/16 NB card.

- The Token Ring adapter cable may have to be tightened to the card with a slight amount of plastic from the Dock. Basically, the slot openings are not wide enough to accommodate the larger Token Ring DB-9 connectors, and it may be necessary to tighten the connector over some plastic. It works OK, just be sure to tighten the connector to the card fully.

- Be sure you have a manual on the Dock showing how to get it open. It is not obvious and a bit tricky.

So the bottom line; Token Ring 4/16 NB cards in Duo Docks work fine, use the Token Ring drivers which come with System 7.1 disks, place the card in the most inside of the two slots, and tighten the cable fully.

Article Change History:
23 Aug 1993 - Updated for NSI 1.3.3.

DAL Server For Novell Networks and HP9000 (2/93)

Revised: 3/8/93
Security: Everyone

DAL Server For Novell Networks and HP9000 (2/93)

==========

Article Created: 25 February 1993

TOPIC ----------

Has anyone worked with the Netware SQL Development Kit? I understand this incorporates a DAL Server for Novell's Btrieve DBMS. Where can I get the DAL Command set for embedding into a C program running on my Macintosh, and to then access Btrieve information from the Novell server? (I would think this would be part of the Netware SQL Development Kit but it's not.) What else would I need on the Macintosh to support DAL?

I would also appreciate a confirmation of a DAL server existing for Oracle on an HP9000 UNIX host. Does one exist?

DISCUSSION ----------

Yes, the DAL Server from Novell is supposed to support access to data stored by Btrieve.

The information that you desire about how to code the DAL API commands in a C program is in the "Data Access Language Developer's Toolkit" from APDA. The DAL Developer's Toolkit includes the "Programmer's Guide" and "Application Developer's Guide", which should tell you all you need to know to develop your own DAL applications.

With System 7.0 and 7.0.1, minimal DAL Client software shipped as part of the system software. This client included only AppleTalk, AppleTalk via the Comm Toolbox ADSP Tool and Async connection support. If additional connectivity was desired, then the client (as part of the Developer's Toolkit) would need to be purchased separately.

As of System 7.1, none of the DAL Client is shipped with the system software. Therefore, the Developer's Toolkit, or the new "Data Access Language Client for Macintosh" product, which does not contain the

developer libraries and documentation, would be required via a separate purchase from APDA.

You also have the option of using commercially developed products which support DAL access such as: ClearAccess, GQL, DataPrism, and so on, to access the data on their Novell DAL Server.

Pacer Software has confirmed that they are shipping a DAL Server for the HP9000 with support for Oracle as the DBMS.

FPU (Floating-Point Unit): Benefits

Revised: 3/1/93
Security: Everyone

FPU (Floating-Point Unit): Benefits

==========

Article Created: 1 March 1993

TOPIC ----------

This article describes the benefits of Floating-point Units, also known as FPUs or math coprocessors.

DISCUSSION ----------

What Kind of Applications Benefit Most

Floating-point Units (FPUs or math coprocessors), such as the 68881/68882, offer the greatest benefit in applications that tend to be very floating-point (arithmetic) intensive. The specific types of applications that benefit most from an FPU are those that process large amounts of floating-point instructions for precision, and will utilize an FPU extensively. Examples are CAD/CAM, 3-D modeling, scientific applications, and financial applications.

To realize the full potential of an FPU, applications must access the FPU directly by using MC68881/MC68882 assembly language instructions, or by using the MC68881/MC68882 compiler option when programs are created. Programs thus achieve a speed gain anywhere from 40 to 700 times in processing floating-point instructions.

Applications that do not access the FPU directly can still realize a significant gain in calculation speed if they use SANE (Standard Apple Numerics Environment). SANE automatically calls on an FPU, if one is present, yielding a speed increase from 5 to 50 times.

Applications That Benefit Less

With desktop publishing (DTP) applications, the use of floating-point arithmetic is limited, and the overall gain from an FPU will be minimal.

In applications such as video, QuickTime, or pre-press color, most of the calculations involved are on large amounts of integer data, and speed gain from an FPU will be minimal, if any.

How To Tell the Difference

In most cases, to determine the use of an FPU or SANE by an application, you need contact the software developer. Some applications are more explicit: they check for an FPU and inform the user. For example, Excel states in its "About..." box whether a math coprocessor is present.

Centris 650: No FPU Upgrade from Apple (7/94)

Revised: 7/28/94
Security: Everyone

Centris 650: No FPU Upgrade from Apple (7/94)

==========

Article Created: 1 March 1993
Article Reviewed/Updated: 28 July 1994

TOPIC ----------

Has Apple announced an FPU upgrade for the Centris 650?

The information in this article relative to the Centris 650 is also relevant to the Quadra 650.

DISCUSSION ----------

A Centris 650 can be ordered with an FPU at the time of purchase, but Apple is offering no post-sale upgrade.

All configurations, except for the 4/80 configuration (M1276), ship with the 68RC040, which has the FPU on-board. Customers who purchase the 4/80 configuration (M1276), then decide to upgrade, must rely on other vendors for an FPU upgrade.

Article Change History:
28 Jul 1994 - Added reference to Quadra 650 to aid in searching.
12 Aug 1993 - Clarified which model configuration this applies to.

A/UX: AcuCOBOL-85 Compatibility (2/93)

Revised: 3/9/93
Security: Everyone

A/UX: AcuCOBOL-85 Compatibility (2/93)

==========

Article Created: 25 February 1993

TOPIC ----------

I have recently transferred my information from a Wang system to a Macintosh. The one application that remains is my lawyer's billing system. I found that this system is available on UNIX running under AcuCOBOL. Will AcuCOBOL run under A/UX?

DISCUSSION ----------

According to A/UX Solution Guide on page 182, AcuCOBOL-85 from AcuCOBOL, Inc. is compatible with A/UX.

AcuCOBOL Technical Support indicated the following:

- AcuCOBOL-85 version 1.5.5 or v 2.0.4 is for Macintosh II computers under A/UX 2.0.1

- AcuCOBOL-85 version 2.0.4 For Quadra is for Quadra computers under A/UX 3.0

For more details, contact AcuCOBOL, Inc. directly. To locate a vendor's address and phone number, use the vendor name as a search string.

Apple Internet Router, Serial Ports, and Switched 56 (2/93)

Revised: 3/9/93
Security: Everyone

Apple Internet Router, Serial Ports, and Switched 56 (2/93)

==========

Article Created: 26 February 1993

TOPIC ----------

Can I place a third-party Comm ToolBox compliant NB Serial card into a Macintosh running Apple Internet Router 3.0, and can I use the card to perform async half routing? I want to create a dedicated router which routes one TokenTalk, one LocalTalk, and one or two 56Kb serial links.

I have my own switch 56 lines, DSU/CSU's, all via async capability. The desire is to add a Hurtler card and drive the line at a 57.6 Kb rate from the router. The card has its own processor to maintain router performance.

Questions:

- Does the Internet Router 3.0 use Comm ToolBox compliant ports like ARA does?
- Is this a reasonable configuration, or is there a better AppleTalk only router for Token Ring to SW56? LocalTalk would be nice as well.
- If the Hurtler card can be seen by the router, will it assist performance over a Macintosh built-in serial port?

DISCUSSION ----------

The Apple Internet Router will not support any devices other than the built-in serial ports for dial-up routing. But all is not lost, MultiAccess Computing builds a Switched 56 card for the Macintosh, and provides an ADEV that allows you to use it as a standard interface for routing AppleTalk over the SW56 link.

Contact MultiAccess Computing for more information on their card. To locate a vendor's address and phone number, use the vendor name as a search

string.

DAL Temporary Datasets and ACF2 Violations (2/93)

Revised: 3/8/93
Security: Everyone

DAL Temporary Datasets and ACF2 Violations (2/93)

==========

Article Created: 26 February 1993

TOPIC ----------

My DAL server was recently abnormally terminated by ACF2. I found that ACF2 terminated DAL since there were too many ACF2 violations. Apparently a temporary dataset named "userid.hostdal.out.dt231323.f001" was being created by DAL, but DAL did not have create authorization. I have worked around this problem by creating a ACF2 rule that allows DAL to create and write to this dataset.

I'm wondering what other datasets DAL creates that might need ACF2 authorization. I would like to create a generic, or at least less specific, ACF2 rule that will allow DAL to create the datasets it needs.

DISCUSSION ----------

The temporary dataset being created with the dataset name of:

    userid.hostdal.out.dt999999.f001

occurs whenever:

- There is a large query done whose return dataset will not fit in internal storage.
- A query is done for either extract or scroll.

The more generic ACF2 rule to set up would be:

    userid.hostdal.out

as the next field, date/time (dt999999), will change all the time.

The only other datasets that would be created by DAL, and they would NOT be temporary ones, would be the result of requesting logging in the environment file -- which hopefully they DO NOT do.

- If the Environment file contains the statement:

      DALSESLOG=TRUE

  the dataset name will be created as:

      userid.dalses.log

- If the Environment file contains the statement:

      DALLOGGING=TRUE

  the dataset name will be created as:

      userid.hostdal.log.dt999999.f001

In summary, create the more general ACF2 rule which allows all datasets created with the name beginning as:

    userid.hostdal.out

and not specify the date/time portion.

ABS Tech Note: SNA•ps00 About SNA•ps Tech Notes (5/93)

==========

Article Created: 24 May 1993

TOPIC ----------

This document accompanies each release of Enterprise Technical Notes.

DISCUSSION ----------

We want Technical Notes to be distributed as widely as possible, so they are sent to all Partners and Associates at no charge; they are also posted on AppleLink in the Developer Services Bulletin Board.

We place no restriction on copying Technical Notes, with the exception that you cannot resell them, so read, enjoy and share. We hope Enterprise Technical Notes will provide you with lots of valuable information.

Technical notes are a ‘living’ complement to product documentation, be it Inside Macintosh or other documentation. This means that they are updated on a regular basis, so as to be accurate and up to date. New Notes are added as required.

This technical note is an index of all technical notes related to the SNA•ps and related products. It also documents all changes to the technical notes since the previous release.

Index

SNA•ps 3270 1.1.1 Release Notes (2/93)

Revised: 3/8/93
Security: Everyone

SNA•ps 3270 1.1.1 Release Notes (2/93)

==========

Article Created: 19 February 1993

TOPIC ----------

This article describes the release notes for SNA•ps 3270 1.1.1.

DISCUSSION ----------

Fixed in Previous Release (v1.1)

- A read buffer problem was fixed. This bug caused bad data to be sent to the host when requesting color attributes. If this data was then sent back to SNA•ps 3270 by the host, SNA•ps 3270 would give a negative response.

- ASCII translation tables were being released before text file transfer completed when multiple file transfers were taking place at the same time. This caused garbage data to appear in the file that finished the transfer last.

Fixed in This Release (v1.1.1)

- An alert was added to handle a new gateway error received when too many clients are connected to a gateway.

- A simple security mechanism was added. If the security resource is removed from the application file, then the user cannot change the default connection or select a new connection for a document. An administrator must supply a preferences file with a default connection or a document with the appropriate connection already selected.

- A problem with an improper positive response to a bind was fixed.

- Resources were added for new Norsi keyboard.

- The ability to type-ahead was added. After an AID key is entered, SNA•ps 3270 will still accept keystrokes even if input is inhibited.

- Keystroke handling in numeric fields was changed to accept comma and dup keys.

- A pop-up menu in the connection dialog now allows model type selection for SNA•ps Gateway connections. This feature only works if the dynamic log mode feature of VTAM is turned on (this feature first binds, then queries the terminal for desired screen size, then unbinds and rebinds with the desired screen size). If it is not turned on, selecting a specific model has no effect.

- Printing speed was improved for system 7.0. When printing, SNA•ps 3270 first checks to see if the Noiro font is installed. If it is, that font is used for printed output. An initial bug with this new printing feature caused printed text to be improperly clipped in some font sizes. This has been fixed in this release.

SNA•ps 3287 1.1.1 Release Notes (2/93)

Revised: 3/8/93
Security: Everyone

SNA•ps 3287 1.1.1 Release Notes (2/93)

==========

Article Created: 19 February 1993

TOPIC ----------

This article describes the release notes of SNA•ps 3287 1.1.1.

DISCUSSION ----------

Fixed in This Release (v1.1.1)

- Text file output now properly converts unwanted control codes in the data stream into characters that are handled properly by text editors.

- A problem handling end-of-bracket markers during output to text file was fixed. The original symptom was a failure to append subsequent data to the text file.

- A typo in the OpenSession code that prevented use of translation tables other than US English was fixed.

- The interface to the Macintosh Printing Manager was reworked to look more like a "normal" Macintosh application: the entire print job is now printed modally, with background printer spoolers such as PrintMonitor providing optimal response time. Previously, the connection to the Printing Manager was established as soon as the session had data to print, and not closed until the print job timed out (a potentially long interval); during this interval the user could muck around with the machine except on direct-connect printers: mucking around is OK on the current LaserWriter driver and is deadly on the current ImageWriter driver. The change in 1.1.1 is to wait until the job times out, and then open the Printing Manager connection, print the entire job, and close the connection. This eliminates the ability to muck around (which may not be safe on future or other network-connected printer drivers) and eliminates the long interval during which the Printing Manager connection was kept

open on direct-connect printers even if they supported print spooling.

- Because of the changed interface to the Printing Manager, the default timeout setting was changed to include a 200-page timeout limit. This is because at the default memory size of 512K, we can guarantee having enough memory to accumulate and then print 200 pages without running out of memory, and the changed Printing Manager interface means that we accumulate data until an entire job has arrived (as opposed to printing each page as it arrives). Otherwise, if print jobs arrive without the default timeout gap of 30 seconds, we would eventually run out of memory and stop receiving -— and thus never print the job until the user intervened and customized the timeout settings. The new default setting simply guarantees that SNA•ps 3287 can be installed and used without fine-tuning the timeout settings even if print jobs arrive continuously.

Known Problem Areas

- Printing on the LaserWriter driver with background printing turned off (and therefore under System 6.x with MultiFinder turned off) does not work.

SNA•ps Access/3270 1.1.1 Release Notes (6/96)

Revised: 6/28/96
Security: Everyone

SNA•ps Access/3270 1.1.1 Release Notes (6/96)

==========

Article Created: 19 February 1993
Article Reviewed/Updated: 28 June 1996

TOPIC ----------

This article describes the release notes of SNA•ps Access/3270 1.1.1.

DISCUSSION ----------

Notes

This is a bug fix release of only SNA•ps Access/3270. These files must be placed in the System Folder for System 6.x, or in the Extensions Folder for System 7.x, and the Macintosh must be restarted.

SNA•ps Access/3270 Bugs Fixed Since 1.1

• A new SNA•ps Access/3270 specific error code has been added and may be returned by OpenHostConns: kCapyTooManyUsers (-8527) which indicates that the maximum number of gateway clients has been exceeded.

• Double-byte support for LU1 and LU3 printers has been added, but is not fully tested.

• QR DDM: SNA•ps Access 3270 uses 0x2000 as the value for MAX DDM In and MAX DDM Out. This is a resource item and may be changed in SNA•ps Access/3270. It has currently been reduced to 0x07D0 in the shipped version as a customer has reported problems with host applications at the higher value.

• The default language is now used in OpenSession when EITHER a nil hostLangDef pointer was passed OR when a count of zero languages was passed. In the 1.1 version the default language was used only when a count of zero languages was passed. Starting with 1.1.1B1, the default language was used only when a nil hostLangDef pointer was passed.

• The cursor width returned in GetUpdate, GetCursorPos, and SetCursorPos is now

returned as kDoubleWidth when the cursor is positioned under an SI character, even though the width reported in the DAB for the SI is single width (Elex feature).

• When writing a character on SO/SI or SI/SO pairs (two bugs fixed):

1) SO Ca/Cb Cc/Cd SI SO Ce/Cf Cg/Ch SI: When you position the cursor under SI, select the double byte character set, and enter a DOUBLE BYTE CHARACTER, Ci/Cj, then the buffer now becomes 'SO Ca/Cb Cc/Cd Ci/Cj Ce/Cf Cg/Ch SI', the cursor goes under Ce/Cf, and SI is be deleted.

2) SO Ca/Cb Cc/Cd SI SO Ce/Cf Cg/Ch SI: When you position the cursor under SI, select the single byte character set, and enter a SINGLE BYTE CHARACTER, C1, then the buffer now becomes 'SO Ca/Cb Cc/Cd SI C1 sp SO Cg/Ch SI' and the cursor goes under the space with single width.

• The sysz resource in SNA•ps Access/3270 has been increased by 15K to make loading at boot time more reliable.

• SNA•ps Access/3270 no longer crashes when loading at boot time on a Mac Plus. This was caused by indirectly calling the _HWPriv trap which is not implemented on a Mac Plus.

• DBCS: Double byte characters are now allowed in a numeric field.

• DBCS: If you overwrite an SO while inserting a DB, it now may do an automatic delete.

• DBCS: If on an attribute, then it can't be 1st or second-byte of DBCS.

• DBCS: Several other changes for DBCS handling.

• We now reset the reply mode to Field Reply Mode when the WCC has the WCCRESET bit if the write command is an Erase/Write or an Erase/Write Alternate. If the write command is "Write" the reply mode remains unchanged.

• Opening a "kept" session no longer crashes sometimes.

• File Transfer: when file transfer was initiated with the CRLF set to true, then when a CRLF pair is found, we no longer add another LF.

• Field outlining will now only report the outlining for the current character, not the entire field. Previously, the outlining for the entire field was reported for each character. If the outlining was left, right, over, and under, then the application would have to determine the start and end of the field in order to avoid drawing a box around each character. Now, for middle characters in a field, the left and right sides for outlining are not reported. For the first character of a field, the right side is not reported on. For the last character of a field, the left side is not reported on.

• DBCS: If the operator attempted to enter a single byte at the end of a DBCS

subfield which was also at the end of the current field, an error was reported. SNA•ps Access/3270 thought it needed 4 characters, but in this case, it only needs 3 character positions in order to enter the single byte.

• DBCS: If the operator tries to extend an existing DBCS subfield in a field that has SO/SI creation disabled, SNA•ps Access/3270 was reporting an error. The operator may now extend a subfield created by the host application.

• Numeric Lock: The comma is now an allowed character in a numeric field, when numeric lock is enabled.

• Query Reply Summary: SNA•ps Access/3270 was incorrectly calculating the length of the QR Summary. It now no longer sends one extra byte with the value 0.

• QR DDM: SNA•ps Access 3270 uses 0x3000 as the value for MAX DDM In and MAX DDM Out. These values were gotten from an OS/2 machine. It speeds up file transfer to use this larger block size. This is a resource item and may be changed in SNA•ps Access/3270. It has currently been reduced to 0x2000 in the shipped version as a customer has reported problems with back-level host applications at the higher value.

• When specifying a default background color of zero in OpenSession or SetSessionParams, the Background Color self defining parameter is no longer sent in addition to the main part of the Color Query Reply. In the past, a zero value was taken to be the default and the background color was changed to 0xF0 and the self defining parameter was always sent. Now, the self defining parameter is sent only if the background color passed in OpenSession or SetSessionParams is non-zero.

• When DBCS is active, if a field attribute specifies DBCS, but the previous character was not a double-byte character, then the DBCS field is now correctly reported as being single-byte.

• INSERT now leaves the cursor under the SPACE, if a single byte character is inserted into a DBCS field. It previously left it under the SO.

• The error kAPIKeyCodeErr was incorrectly returned when copying nulls to the presentation space. The CopyToPS, CopyToField, and TranslateNative requests have been modified so that if a null byte is passed by the application, and it is translated into a null, then an error is no longer returned. If any character other than a null byte is translated into a null, then the request still returns kAPIKeyCodeErr.

• If more than one language was specified in OpenSession or SetSessionParams, then when those language tables were freed, the Macintosh would crash. The code was modified so that more than one table can safely be specified in these requests.

• The SA order no longer occasionally sends invalid values inbound.

• When performing CUT mode file transfer (through the PS) with a binary file, the correct translation table is now used.

• The StartSend and StartReceive requests no longer ignore the CRLF parameter with binary files.

• The StartSend request no longer sets the RECFM parameter when the recordType is kUndefined and the hostEnviron is kVMHost.

• Show3270API now allows repeated output of the list of host languages without quitting and restarting program.

3270 Prep Bugs Fixed Since 2.0

• '3270 Prep' now also allows searches files of type APPL for access methods (in the Control Panels, Extensions, and System Folder folders as before).

• The '3270 Prep' function which loads and frees translation tables now accepts a keyboard ID of zero. In this case, only the language ID is used to select the appropriate table. If more than one keyboard ID is used for a given language ID, the first table in the list is returned (or freed). It is assumed that all tables with the same keyboard ID are equal. This is the case for non CUT implementations.

• 3270 Prep no longer crashes when loading at boot time on a Mac Plus. This was caused by indirectly calling the _HWPriv trap which is not implemented on a Mac Plus.

SNA•ps Gateway 1.1.1 Release Notes (2/93)

Revised: 3/8/93
Security: Everyone

SNA•ps Gateway 1.1.1 Release Notes (2/93)

==========

Article Created: 19 February 1993

TOPIC ----------

This article describes the release notes of the SNA•ps Gateway 1.1.1.

DISCUSSION ----------

This release of SNA•ps Gateway contains changes since version 1.1:

- Problem Starting Token Ring 4/16 NB Cards.
  Restarting the Token Ring 4/16 NB Card from SNA•ps Admin or 3270 Manager sometimes failed because the IBM Chip-set sub-assembly had not been properly reset.

- SNA•ps Admin/Gateway Message Log problem.
  An error in the length field of some Log Messages caused SNA•ps Admin to fail to display the Message Log correctly.

- BIND rejection problem.
  The SNA•ps Gateway will now accept a BIND requests with LFSID 0200 (ODAI 0 or 1) for an Independent LU.

- Coax SNA/DFT problem.
  This SNA•ps Gateway release fixes a problem with the Coax RESET command (CUT & NLCA is not affected). The problem only occurred when using the SNA•ps Gateway to connect to a NIU-78 controller (Ungermann Bass).

- Line Trace problem.
  The decoding of Coax (SNA/DFT) specific trace data has been improved. Line trace performance has also been improved in SNA•ps 1.1.1.

- Missing UNBIND response.
  The SNA•ps Gateway will no longer withhold UNBIND responses to UNBIND

Type 0xA (SSCP Gone).

- A/Rose Forwarder usage.
  SNA•ps no longer makes use of the A/Rose Forwarder (FWD) extension. The SNA•ps 1.1.1 Installer will not remove old copies of the FWD extension when installed on a system where FWD is installed. If FWD is not being used by other applications on the system, removing it will reduce memory usage.

ABS Tech Note: SNA•ps01 Version Compatibility (5/92)

Revised: 9/2/93
Security: Everyone

ABS Tech Note: SNA•ps01 Version Compatibility (5/92)

==========

Article Created: 31 May 1992

TOPIC

This technical note describes the compatibility between the 1.0 and 1.1 releases of SNA•ps.

DISCUSSION

Introduction

Improvements in SNA•ps 1.1 have forced some incompatibilities with SNA•ps 1.0. The result is that when the client machine and the gateway machine are running different versions of SNA•ps (1.0 vs. 1.1), the client machine will not be able to access certain resources on the gateway machine.

Which Versions of Which Files?

In order for SNA•ps clients to access gateway services (that is, connecting, displaying, starting/stopping gateways, and so on), the SNA•ps Access extension on the client machine and the SNA•ps Gateway extension on the gateway machine must be the same version. If the SNA•ps Access extension on the client machine and the SNA•ps Gateway extension on the gateway machine have different versions, these gateway services are not accessible.

There have been three versions of SNA•ps 3270 to date: 1.0.1 (first release), 1.0.2 (maintenance release), and 1.1 (released with SNA•ps 1.1). However, from a compatibility viewpoint, what is important is not the version of SNA•ps 3270, but rather the version of the SNA•ps Access extension (which is installed with the SNA•ps 3270 application). The version of SNA•ps Access must match the version of the SNA•ps Gateway for the connection to be successful.

Similarly, SNA•ps Admin will not be able to start, stop, or display a gateway if the SNA•ps Access on the client machine is a different version from the gateway.

The following paragraphs and figures detail what happens from the client application's perspective under different version scenarios.

SNA•ps Admin Details

There are basically four scenarios:

- 1.0 client and 1.0 gateway
- 1.0 client and 1.1 gateway
- 1.1 client and 1.0 gateway
- 1.1 client and 1.1 gateway.

In the two scenarios where the versions match, everything works correctly.

In the scenario where the client machine is SNA•ps Admin 1.0 and SNA•ps Access 1.0 but the gateway machine is a SNA•ps Gateway 1.1, the following occurs. The 1.1 gateway is visible in the Network Gateway Status window, and can even be started and stopped. However, if you attempt to display a 1.1 gateway's resources, an alert is displayed informing you that the version of the SNA•ps Access extension is lower than that of the gateway.

In the scenario where the client machine is SNA•ps Admin 1.1 and SNA•ps Access 1.1 but the gateway machine is a SNA•ps Gateway 1.0, the 1.0 gateway is grayed out in the Network Gateway Status window, thereby preventing you from starting, stopping, or displaying resources on the back-level gateway.

Figure 1 shows the compatibility matrix for SNA•ps Admin and the SNA•ps Gateway.

		SNA•ps Gateway Version	
		1.0	1.1
SNA•ps Admin and SNA•ps Access Version	1.0	OK to start, stop, and display 1.0 gateways	OK to start and stop 1.1 gateways.Alert if attempt to display 1.1 gateways
	1.1	1.0 gateways grayed out in status window	OK to start, stop, and display 1.1 gateways

Figure 1. Compatibility Matrix for SNA•ps Admin and SNA•ps Gateway

SNA•ps 3270 Details

Again, there are basically four scenarios:

- 1.0 client and 1.0 gateway
- 1.0 client and 1.1 gateway
- 1.1 client and 1.0 gateway
- 1.1 client and 1.1 gateway

As mentioned in the introduction, it is the version of SNA•ps Access on the client machine, not SNA•ps 3270, that mainly determines the behavior here.

In the two scenarios where the version match, everything works correctly.

In the scenario where the client machine is SNA•ps 3270 1.0.x and SNA•ps Access 1.0 but the gateway machine is a SNA•ps Gateway 1.1, the gateway is visible in SNA•ps 3270's connection dialog, but the Pools and Sessions associated with the gateway will not be visible. SNA•ps 3270 will be able to start the gateway if it is stopped, but the Pools and Sessions will still not be visible. In SNA•ps 3270 1.0.1 the list of Pools or Session is simply empty; in 1.0.2 and later an alert is first displayed informing you that the versions are different.

In the scenario where the client machine is SNA•ps 3270 1.1 and SNA•ps Access 1.1 but the gateway machine is a SNA•ps Gateway 1.0, when you select the gateway in the connection dialog an alert is displayed informing you that the gateway is of a back-level version.

Figure 2 shows the compatibility matrix for SNA•ps 3270 and the SNA•ps Gateway.

SNA•ps 3270 and SNA•ps Access Version	SNA•ps Gateway Version 1.0	SNA•ps Gateway Version 1.1
1.0	OK to connect to and start 1.0 gateways	OK to start a 1.1 gateway, but Pools and Sessions not shown
1.1	Alert displayed if attempt to select a 1.0 gateway	OK to connect to and start a 1.1 gateway

Figure 2. Compatibility Matrix for SNA•ps 3270 and SNA•ps Gateway

Third-party APPC Clients

For the case of third-party APPC client software it is required that the version of SNA•ps Access running on the client machine and the version of the SNA•ps Gateway running on the server machine MUST be the same (that is, both 1.0 or both 1.1). Any applications that worked with SNA•ps 1.0 will continue to work with SNA•ps 1.1 as long as the client machine and the gateway machine are both running the same version of SNA•ps.

ABS Tech Note: SNA•ps02 Gateway Memory Issues (5/92)

Revised: 9/2/93
Security: Everyone

ABS Tech Note: SNA•ps02 Gateway Memory Issues (5/92)

==========

Article Created: 31 May 1992

TOPIC

This technical note describes the memory usage of the SNA•ps Gateway 1.1 on NuBus communications boards. It will help users configuring and running the SNA•ps Gateway product to accurately predict workable memory configurations for a particular NuBus card.

DISCUSSION

Introduction

SNA•ps 1.1 includes support for the new Apple Token Ring 4/16 card. When running a SNA•ps Gateway on the Apple Token Ring 4/16 card it is recommended that the card contain a minimum of 1Mb of memory. A minimum of 2.5Mb of memory is recommended on the Apple 4/16 Token Ring NB card to run the 64 LU gateway package.

The Apple Serial NB ("SDLC") card can now run both MacX25 Version 1.1 and the SNA•ps Gateway simultaneously; the only requirement is that the SNA•ps Gateway must be running before MacX25 is loaded.

Token Ring Card Details

For the two Apple Token Ring cards (the original Apple TokenTalk NB and the new Apple Token Ring 4/16), the number of sessions that can be supported depends on whether TokenTalk is concurrently running on the card, and how much memory is installed on the card.

TokenTalk 2.2 uses 12,000 bytes on the card. Running TokenTalk 2.2 on a TokenTalk NB card leaves 43,000 bytes available for use by the SNA•ps Gateway. This is enough memory to run the 8 LU SNA•ps Gateway package.

TokenTalk 2.4, which is required for the Token Ring 4/16 card, uses 54,000 bytes on the card. Therefore, in order to run a SNA•ps Gateway on the Apple Token Ring 4/16 card it is recommended that the card contain a minimum of 1Mb of memory. To run the 64 LU SNA•ps Gateway package, a minimum of 2.5MB of memory on the card is recommended.

Apple Serial NB Card Details

When a SNA•ps Gateway is loaded onto a 1/2 megabyte SDLC card with no other applications running on it, 54,000 bytes are available for the gateway.

SDLC cards can run MacX25 in addition to the SNA•ps Gateway. However, the SNA•ps Gateway must be loaded and started before MacX25 is loaded. The SNA•ps Gateway limits the amount of memory it reserves to twice the minimum amount, as calculated below. The remainder is available for use by MacX25 or other applications.

Coax/Twinax NB Card Details

Since the SNA•ps Gateway doesn't allow you to change the configuration of a coax gateway to more than 5 LUs, memory usage is not an issue. Configurations will always fit on an Apple Coax/Twinax NB card.

Minimum Memory Usage Computation

To run a gateway, you must first configure objects on that gateway. The description given below is of the procedure that is used by SNA•ps to compute the amount of memory required for a given gateway configuration.

The total amount of memory that is used by the various configurable objects is given in the table below. Use this table to calculate the amount of memory used by your configuration.

Bytes Used	Resource
7490	Gateway Overhead (always required)
250	Line
1160	Host Partner
690	Peer Partner
270	6.2 LU (Local LU)
1930	3270 LU
270	Local LU User or Profile
190	Transaction Program
190	Transaction Program User
1100	Remote LU with parallel sessions enabled
120	Remote LU without parallel session enabled
200	Mode
1600	Each 6.2 Peer Session
2100	Each 6.2 Host Session

In addition to the memory amounts listed above, there is a factor for the allocation of data buffers which must be made based on the largest BTU (I-frame) that has been configured. The following table indicates the

multiplier. Multiply the number obtained by adding up all the individual requirements above by the multiplier given below.

Max BTU Size	Multiplier
0 - 265	1.43
266 - 521	2.00
522 - 1033	2.50
1034 - 2057	3.33
2058 or larger	5.00

After this computation is complete, the memory required for the link buffers must be added. If there are any Local LUs (6.2 LUs) in the configuration, add 8 times the size of the largest BTU that has been configured to the total. Additionally, if this is a Token Ring configuration, add 160 to the total, and also add 8 times the size of the largest BTU to the total. The result is the final amount of memory required.

Security: Everyone

ABS Tech Note: SNA•ps03 MCP Memory Installation (12/94)

==========

Article Created: 31 May 1992
Article Reviewed/Updated: 14 December 1994

TOPIC

This technical note discusses installation of memory onto Apple Serial and Apple Token Ring 4/16 MCP NuBus cards.

DISCUSSION

Introduction

The Apple MCP (Macintosh Coprocessor Platform) cards are smart busmaster cards that contain an on-board 68000 processor and 512 KB of RAM (minimum configuration) soldered onto the card, with 4 sockets available for expansion memory. This document details adding memory, using those expansion sockets, to the Apple Serial NB and Apple Token Ring 4/16 NB cards; there is no reason to add memory to an Apple Coax/Twinax NB card, since the DFT terminal it emulates only allows 5 sessions; the original Apple TokenTalk NB card (4 megabit speed only) has 512 KB soldered RAM and no expansion slots.

The Memory Expansion Kit

The Apple Macintosh Coprocessor Platform Memory Expansion Kit (M0145LL/A) provides 4 memory chips for those 4 sockets that allows you to add another 512 KB RAM to the board, for a total of 1 MB. This is large enough for most uses of the SNA•ps Gateway. It is possible to purchase a higher density memory chip from third party memory vendors that will create a total of 2.5 MB; this amount of memory is desirable for 64-session gateways with large I-frame sizes. All four chips must be of the same density, so the possible memory configurations are 0.5 MB (no expansion), 1 MB (using Apple's expansion kit), and 2.5 MB (using higher density third party chips).

The memory chips themselves are quite fragile and should be handled carefully. Use a grounding strap, and check that the pins are straight. Try to get the orientation correct on the first try so that they won't have to be handled more

than necessary. Insert by pushing down with a straight, steady motion. If a pin bends on insertion, try using a small screwdriver to push it into the socket, rather than pull the chip out and try again. To remove the chip, use a gentle rocking motion with a steady upward pull. Tools designed for inserting or pulling these chips have not been found.

Some chips are missing a pin. This is normal.

Orientation

Pin one is marked with a recessed dot on the lower part of the chip (lower left corner of the side with writing); this is also the end with the beveled corner. On the Apple Serial NB card, there is a corresponding dot on the circuit board. By holding the card with the NuBus connector facing you, the side of the memory chip with writing will be facing you. On the Apple Token Ring 4/16 NB card, there is a marking on the circuit board that represents the beveled edge; the resulting orientation will cause the blank side of the memory chip to be facing you.

The Apple Token Ring 4/16 NB card has 2 diagnostic lights. After power-up diagnostics, the green light should be on and the red LED should be off. If the red light stays on, there is a problem, and it is possible that the memory was not installed correctly.

Memory Specifications

When buying memory chips, the following specifications must be met:

- Type: Dynamic RAM
- Size: 256K x 4, or 1MB x 4 (depending on amount of memory desired)
- Configuration: 4 bits wide
- Package: ZIP
- Speed: 120 nS or faster (for example, 100 nS or 80 nS)

To expand memory to 1 MB:

- (4) 256K x 4 bit DRAM chips, 120 nS or faster, ZIP package
- Mitsubishi part number M5M44C256L-12
- Hitachi part number HM514256ZP-12
- Apple part number M0145LL/A, "Macintosh Coprocessor Platform Memory Expansion Kit"

To expand memory to 2.5 MB:

- (4) 1M x 4 bit DRAM chips, 120 nS or faster, ZIP package
- Toshiba part number TC514400Z-10
- Motorola part number MCM54400AZ80
- TI part TMS44400-12SD

NOTE: The Toshiba TC514400AZ-80 is 1M x 4 bit (4Mbit) ZIP module. You need 4 of these 4Mbit ZIP modules to get 2MB or RAM added to the Token Ring 4/16 NB Card to get a total 2.5MB of RAM. The TC514400AZ-60 and TC514400AZ-70 will work as well. The "-80", "-70", and "-60" indicate the speed in nanoseconds of the ZIP

module. As long as the TC514400AZ module is 120ns or faster it will work correctly.

ABS Tech Note: SNA•ps04 Bullets in Admin (5/92)

==========

Article Created: 29 May 1992

TOPIC

This technical note explains the meaning of the bullets that show up in the SNA•ps Admin status display.

DISCUSSION

Introduction

The small black circles that appear in the gateway status display in SNA•ps Admin are intended to give a general indication of the state of the particular resource in the gateway. Detailed state information can be found by opening the resource. The exact meaning of the status indicators is given here.

For all resources except for 3270 LUs:

- A bullet (" • ") displayed indicates that the resource is in the active state.
- A small open circle (" ° ") displayed indicates that the resource is always activated.
- No symbol displayed indicates that the resource is not in the active state.

For 3270 LUs:

- A bullet displayed indicates that the LU is in use by an application program such as the SNA•ps 3270 terminal emulator.
- A question mark ("?") displayed indicates that this is an LU with an ID

of zero. This will occur when a coax gateway is not in contact with the IBM 3174 controller, or if the 3174 controller has not been configured properly.

- No symbol displayed indicates that the LU is not in use by any client application. If it is a coax line, then the gateway is in contact with the 3174 controller, and the LU has been configured at the controller.

For APPC Modes:

- A bullet displayed indicates that the session limits for the mode have been initialized and are greater than 0.

- No symbol displayed indicates that the mode has not yet had its limits initialized.

ABS Tech Note: SNA•ps05 3287 Performance Tips (4/93)

Revised: 9/7/93
Security: Everyone

ABS Tech Note: SNA•ps05 3287 Performance Tips (4/93)

==========

Article Created: 26 April 1993

TOPIC ----------

This technical note discusses several tips to optimize the performance of SNA•ps 3287.

DISCUSSION ----------

Introduction

The SNA•ps 3287 printer emulator can be configured and used in a variety of ways, depending on the behavior of your host system and applications, and your Macintosh setup This tech note discusses several methods to help you use it as desired.

Preview Window

SNA•ps 3287 has a feature called the Preview Window that shows what the printed page will look like before it prints. However, drawing the preview window requires CPU cycles. If you don’t need to preview the printer data, close the preview window and your print job will print faster.

Timeouts

Each session can have its own timeout settings, which are set via the Timeouts command on the Session menu. The default timeout setting is 30 seconds. If the host application sends an End Of Bracket signal at the end of each print job, turn on the End Of Bracket timeout, and SNA•ps 3287 won’t have to wait 30 seconds to print. Some host applications are known to send an End Of Bracket after each line of data, however, which causes SNA•ps 3287 to put each line on a separate page if End Of Bracket timeout is turned on. In this case, lower the default timeout value to 10 or 15 seconds.

Memory Usage

There is a memory overhead for accumulated unprinted data becuase the session document keeps a small amount of information in memory for each page of data that is accumulated on disk. When available memory becomes exhausted, SNA•ps 3287 simply stops receiving data until some memory is freed by pages being printed. In order to prevent running out of memory, increase SNA•ps 3287's memory partition size by using the Finder's Get Info command on the SNA•ps 3287 icon.

Each unprinted page takes up 512 bytes in memory (i.e. 100 pages takes approximately 50 KBtyes of memory). Each connected session uses about 50 KBytes. The application itself uses 400KBytes.

Here is a formula for the amount of memory SNA•ps 3287 uses:

```
Available memory = 400K + (50 KByte * number of sessions)
                        + (1 KByte * number of accumulated pages)
```

SNA•ps 3287 Font Usage

The SNA•ps 3287 application disk includes a font suitcase containing the Noiro font (pronounced nwah-ro). It contains a TrueType version and several bitmap sizes. Drag it to the System Folder under System 7, or use the Font/DA Mover under System 6. Noiro, the font that SNA•ps 3287 uses by default, is monospaced, i.e. characters will line up correctly from row to row. However, unlike other monospaced fonts such as Courier and Monaco, its boldface characters are the same width as its plain characters, so that characters will still line up even if some of them are boldface.

Another benefit of Noiro is that all of its characters have correct character widths, unlike some fonts that have uneven widths for some characters, and can give overlapping characters. Noiro contains all of the characters defined in the Apple 3270 API Character Set, so any IBM CECP EBCDIC character sent from the host will be drawn correctly.

Viewing the Entire Page

To avoid experimenting with Page Setup in an attempt to fit everything on a LaserWriter page, here are some settings that have been found to work well. When using the Noiro 9-point font, a Landscape (sideways) 76% reduction will fit all 132 columns and all 66 lines on a page.

To see the entire page at once on a 640x480 monitor such as the AppleColor 13" RGB monitor, try a Landscape 150% reduction, but set the font to 6-point Noiro (150% means that the on-screen page will be blown up by 150% when printed, so it is important to use a font size that when blown up 150%, will print as 9-point). The whole page will be visible.

Viewing Text File Output

When outputting to a text file, make sure not to open the text file (from another application) while SNA•ps 3287 is still using it. Otherwise the other application may give an error message about the file being locked or

in use, or may not display the data correctly. To open the text file from another application, make sure SNA•ps 3287 doesn't have the file open. Do this by either closing the SNA•ps 3287 session that was using the text file, or changing the session so that it outputs to a different text file, to the printer, or to the preview window only.

Background Printing and Direct-Connect Printers

Because SNA•ps 3287 is a printer emulator, it doesn't print the same way as a typical Macintosh application. As mentioned in the "Timeouts" section above, it opens a connection to the printer for the duration of a print job. To prevent the user from doing anything while printing to a "foreground" printer like the ImageWriter, SNA•ps 3287 puts up a "Press command-period to cancel printing" dialog for the duration of a print job. This prevents using the Chooser or other applications that might cause problems during printing.

There is no way for SNA•ps 3287 to determine whether the chosen printer is performing foreground printing like the ImageWriter. What can legitimately be determined is whether the chosen printer's driver is for a networked printer or a direct-connect printer. Therefore, SNA•ps 3287 looks at the printer driver's file type. Unfortunately, with the LaserWriter LS, which is a direct-connect printer but supports background printing, the dialog appears even though it's not necessary.

SNA•ps v1.1.1 Changes

The interface to the Macintosh Printing Manager was modified so that the entire print job is now printed modally, with background printer spoolers such as PrintMonitor providing optimal response time. Previously, the connection to the Printing Manager was established as soon as the session had data to print, and not closed until the print job timed out (a potentially long interval); The change in 1.1.1 is to wait until the job times out, and then open the Printing Manager connection, print the entire job, and close the connection. This eliminates the long interval during which the Printing Manager connection was kept open on direct-connect printers even if they supported print spooling.

The default timeout setting was changed to include a 200 page timeout limit. At the default memory size of 512K, SNA•ps 3287 can guarantee having enough memory to accumulate and then print 200 pages without running out of memory. The changed Printing Manager interface means that SNA•ps 3287 can accumulate data until an entire job has arrived (as opposed to printing each page as it arrives). The new default setting simply guarantees that SNA•ps 3287 can be installed and used without fine-tuning the timeout settings even if print jobs arrive continuously.

ABS Tech Note: SNA•ps06 Modem Configurations (10/92)

Revised: 9/7/93
Security: Everyone

ABS Tech Note: SNA•ps06 Modem Configurations (10/92)

==========

Article Created: 30 October 1992

TOPIC ----------

This technical note discusses configuring modems for use with SNA•ps Gateways.

DISCUSSION ----------

Introduction

SNA•ps works with synchronous modems that support either the V25bis or SADL autodial protocols. The Codex 2264, which is a 9600 baud synchronous modem, supports V25bis autodial protocols and has been tested and found to work fine. Other modems, primarily used for asynchronous applications, can be used synchronously if configured correctly. This technical note describes setting up the Hayes SmartModem 9600, Digicom DSI 9624L, and Codex 2264 for use with SNA•ps Gateways.

Configuring Modems for use with SNA•ps Gateways

The Hayes SmartModem 9600 and Digicom DSI 9624L modems can be configured for synchronous serial connections. The procedure is to set the modem to work synchronously and automatically dial a pre-entered phone number when SNA•ps line and partner are both activated.

The following describes how to set up these modems for use with SNA•ps:

- Attach a serial cable to the Modem and connect it to the serial port on the Macintosh.
- Install any terminal emulation program on the Macintosh. (ex. MacTerminal)
- Start the terminal emulation program on the Macintosh. Connect to a terminal session.
- Power on the Hayes Modem.
- While connecting asynchronously (9600 baud, 8 bits, no parity), type the

following commands:

(The information below is for the DSI 9624LE, with notes on where the Hayes differs.)

```
AT&F        -  reset to factory settings
AT*O (DSI)  -  show current settings
AT&S  (DSI) -  show dialing directory  (Hayes: AT&V shows both current
               settings and dialing directory)
AT&Zphone#  -  store phone number in first location (Hayes: AT&Z0=phone
               number)
AT&M2       -  on DTR high, auto dial phone number stored in first
               location  and enter synchronous mode
AT&R1       -  CTS goes on when the modem is ready to receive
AT&B1       -  modem turns on DSR when DTR from attached DCE goes on.
AT&W        -  save configuration
```

- Remove the Serial cable from the Hayes Modem
- Connect the modem to the Apple Serial NB hydra cable.

The line description in the SNA•ps configuration must specify the port the cable is attached to. The SNA•ps Config line settings should be half duplex, NRZ, manual dial, and switched. The phone number in the partner description is ignored, as the phone number stored in the modem is dialed.

When the SNA•ps Gateway is started and the line and partner are activated (either manually or automatically), the modem will dial the stored number.

Using the SNA•ps Gateway Auto-dial Feature

To configure the Codex 2264 modem for auto-dial usage with SNA•ps Gateways, set up the modem as follows:

For answer:

- Choose option set 2
- Change Modify Terminal: DTR: to high

For dialout:

- Make sure that all dip switches in the back of the modem are up
- Choose option set 3
- Modify V.25 BIS:
  - Char set = ASCII -> EBCDIC
  - ACU idle = Char -> Mark
- AUXILIARY, AUX DIALING:
  - tone (vs. pulse)

The line description in your SNA•ps configuration should be half duplex, NRZ, V25bis dialer, and switched. The phone number in the SNA•ps Config partner description will be dialed when the gateway is started and the SNA•ps line and partner are activated.

Configuring the Apple Serial NB Card for use with SNA•ps

The Serial NB card is shipped with ports 1A and 1B configured for V35/RS422 signals. If you plan to use these ports in RS232 mode, remove the two resistor packs in the upper right-hand corner of the board. This is described in the Apple Serial NB Card Installation Guide. SNA•ps can run these ports at 56 K BPS line speeds since the data link control (DLC) task implements DMA on these ports. Channels 2A and 2B, are limited to a maximum of 9600 Baud. All four SDLC ports can be in use simultaneously.

ABS Tech Note: SNA•ps07 Finding Gateways (5/92)

Revised: 9/7/93
Security: Everyone

ABS Tech Note: SNA•ps07 Finding Gateways (5/92)

==========

Article Created: 29 May 1992

TOPIC ----------

This technical note discusses two methods that application programs can use to find SNA•ps gateways.

DISCUSSION ----------

Introduction

The routine GetGatewayList() is used in both the sample programs filecreq.c and filecsrv.c, to find the available gateways in an AppleTalk Zone. The type field specified for the NBPLookup is "SNAGatewayAgent", it should be "SNAGateway" to return the names and addresses for only those SNA•ps Gateways which have previously been started.

Finding Running Gateways

PLookupName() is used to do an NBPLookup for gateways that are available on the network. The entityPtr parameter to PLookupName() specifies what type of network entity is to be looked up.

The type for a running SNA•ps Gateway is "SNAGateway". The type "SNAGatewayAgent" will return the names and addresses for the running SNA•ps Gateways also, but in addition will return the names and addresses of gateways that are configured, but are not currently running. Attempting to establish a connection to one of these gateways will result in an error.

ABS Tech Note: SNA•ps08 3270 API (9/94)

Revised: 9/27/94
Security: Everyone

ABS Tech Note: SNA•ps08 3270 API (9/94)

==========

Article Created: 26 April 1993
Article Reviewed/Updated: 27 September 1994

TOPIC ----------

This technical note discusses Host-based File Transfer support as implemented in the Apple 3270 API 2.0.

DISCUSSION ----------

Introduction

The Apple 3270 API 2.0 supports file-transfers that allow Macintosh applications to store and retrieve data from files located on an IBM host computer. This support allows an application to perform file transfer without regard to the underlying host connection or subsytem.

This Technical Note describes the use of these file transfer requests for SNA•ps Access/3270, Apple's implementation of the Apple 3270 API 2.0. The transfer of files takes place via the 3270 Data Stream and a family of host-based File Transfer programs collectively known as IND$FILE.

SNA•ps Access/3270

The Apple 3270 API 2.0 is a defined programming language interface between the 3270 data stream and Macintosh client applications. SNA•ps Access/3270 is Apple's implementation of the 3270 API, allowing connectivity to IBM hosts via the SNA•ps line of gateway products.

Host-Based File Transfer

The File Transfer between an IBM host and a Macintosh using SNA•ps Access/3270 is controlled by the host application. This application (IND$FILE) is initiated by SNA•ps Access/3270 sending a command to the host to start the file transfer. SNA•ps Access/3270 sends this command in response to a StartSend/StartReceive request from the Macintosh

application. After the file transfer begins, IND$FILE issues requests to SNA•ps Access/3270, and waits for the response. SNA•ps Access/3270 may issue a message to cancel a file transfer operation, but it is up to IND$FILE as to whether/when the cancel takes effect.

Host Environments and Transport mechanisms

IND$FILE operates in three (3) major Host environments—TSO, CICS/VS, and VM/CMS. Each of these environments has a specific implementation of IND$FILE installed to support Host-based file transfer.

There are two mechanisms used to implement the transfer of file information using the 3270 Data Stream.

- PS-based File Transfer (CUT): The Presentation Space (PS) is used to transfer the file data to/from the Host. The PS has several specific formats which differ depending upon the direction of the file transfer. These are:
  - UPLOAD format - used when sending a file to the Host
  - DOWNLOAD format - used when retrieving a file from the Host
  - CONTROL format - used to pass control information to the Macintosh from the Host.

These formats are defined in the section "PS Screen Formats" as 'C' language structures.

- SF File Transfer (DFT): This mechanism uses Structured Fields (SF) to transfer the file to/from the host. The SFs used are part of the Distributed Data Management (DDM) architecture, and are known colloquially as D0(D-ZERO) SFs. Only a small set of the D0 SFs are used; this subset is defined in the section "D0 Structured Fields Subset".

Since there are three (3) possible host environments, and two (2) possible transport mechanisms for each host environment, there are a total of six (6) possible ways to do file transfer.

SNA•ps Access/3270 Requests for File Transfer

SNA•ps Access/3270 simplifies Host-based file transfer by providing a single set of file transfer requests which are independent of the transport protocol used. These requests are:

- StartSend () - allows an application to initiate file transfer to the Host.

- StartReceive () - allows an application to initiate file transfer from the Host.

- DoSend () - allows an application to send data to the Host, signal the end of data to be transferred (i.e., End of File), and abort the file transfer.

- DoReceive () - allows an application to receive data from the Host,

receive messages from the Host (i.e. End of File), and indicate that the application wishes to abort the file transfer.

SNA•ps Access/3270 File Transfer Requests Validation

SNA•ps Access/3270 will validate the parameters to the File Transfer requests and return an error code without performing the operation, if there is an error. If parameter validation fails, the following error codes may be returned:

StartSend

Return Code	Reason
kAPIFTTypeParm	TransferType not equal to kINDFILE.
kAPIFTFileNameParm	hostFileName not specified.
kAPIFTHostEnvirParm	verifyName is true and hostEnviron is not specified
kAPIFTFileTypeParm	fileType is not kTestFile or kBinaryFile
kAPIFTBadFEParam	fileExists is not kNewHostFile, kAppendHostFile, or kReplaceHostFile
kAPIFTRTParam	recordType is not kFixed, kVariable, or kUndefined
kAPIFTNotAvailable	There is not a session with the host.
kAPINotDisplaySession	The session is not a display session.
kAPIFTRecLenParm	The recordLength specified is zero(VM/CMS).
kAPIFTInProgress	There is already a File Transfer in progress.
kCapyResErr	An error occured trying to load a required resource.
kAPIInputInhibit	The 3270 keyboard is locked.
kAPIKeyCodeErr	There is an invalid character in the command line built by SNA•ps Access/3270. (If there is not a translation value for a character in the current character set, this error would be returned.)

StartReceive

Return Code	Reason
kAPIFTTypeParm	fileTransferType not equal kINDFILE.
kAPIFTFileNameParm	hostFileName not specified.
kAPIFTHostEnvirParm	verifyName is true and hostEnviron is not specified. (Check the list below for errors that may be returned when the access method verifies the host file name.)
kAPIFTFileTypeParm	fileType is not kTestFile or kBinaryFile.
kAPIFTNotAvailable	There is not a session with the host.
kAPINotDisplaySession	The session is not a display session.
kAPIFTInProgress	There is already a File Transfer in progress.
kCapyResErr	An error occurred trying to load a required resource.
kAPIInputInhibit	The 3270 keyboard is locked.
kAPIKeyCodeErr	There is an invalid character in the command line built by SNA•ps Access/3270. (If there is not a translation value for a character in the current character set, this error would be returned.)

DoSend

Return Code	Reason
kAPIFTNotAvailable	There is not a session with the host.
kAPINotDisplaySession	The session is not a display session.
kAPIFTNotInProgress	There is not a File Transfer in progress.
kAPIFTRespParm	The appResponse field is not set to kContinueFT or kCancelFT.
kAPISendBufParm	The sendBufPtr is zero, and the sendBufLen is not zero.
kAPIFTNoSendInRcv	The File Transfer in progress is a receive.
kAPIFTCancelBad	The appResponse was kCancelFT, and an error occurred while trying to issue the cancel.
kAPIFTNotRdyToSend	There wasn't a kDoSendEvent generated. If the File Transfer is being made via the PS, then errors associated with CopyToPS may also be encountered. (kAPIScrnSizeChng, kAPIInputInhibit, kAPIByteCountParm, kAPISrcBufParm, kAPIKeyCodeErr, kAPIEndOfPS, kAPIWriteProtFldErr, or kAPIWriteAttrErr.)

DoReceive

Return Code	Reason
kAPIFTNotAvailable	There is not a session with the host.
kAPINotDisplaySession	The session is not a display session.
kAPIFTRespParm	The appResponse field is not set to kContinueFT or kCancelFT.
kAPIReceiveBufParm	The receiveBufPtr is zero, and the numBytesToReceive is not equal to zero, and the appResponse is kContinueFT.
kAPIFTNotInProgress	There is not a File Transfer in progress.
kAPIFTNoDataToRecv	There is no data to be received.

For both StartSend and StartReceive requests you can specify that the Access Method should verify that the host name being passed is a valid name for the specified system. To do this, in the StartSendBlk set verifyName to True and set hostEnviron to the value matching the host environment being used. Name validation may return the following errors:

TSO

Return Code	Reason
kAPIFTBadFirst	Error with resource file or bad first character of hostFileName.
kAPIFTTSOLong	Data Set Name is too long.
kAPIFTQualLon	Qualifier too long.
kAPIFTNoQuoteMemb	Quote around member, but no parenthesis.
kAPIFTBadChar	Invalid character found in the name.
kAPIFTMemberChar	A period or quote was found in a member name.
kAPIFTMisParen	Matching parenthesis is missing.
kAPIFTTSOSpace	A space character was found in the hostFileName.

kAPIFTMemberLong	Member name is too long.
kAPIFTMemberBad	Missing quote or parenthesis.
kAPIFTMisplacedQte	Missing/misplaced quote.
kAPIFTMismatchedQte	Quotes not placed correctly.

VM/CMS

Return Code	Reason
kAPIFTBadFirst	Error with resource file or bad first character of hostFileName.
kAPIFTCMSDot	A period appeared in the hostFileName.
kAPIFTBadChar	An invalid character appeared in hostFileName.
kAPIFTNoType	No "Type" appeared in the hostFileName.
kAPIFTCMSLong	The "Name" field is too long.
kAPIFTCMSTLong	The "type" field is too long.
kAPIFTCMSMLong	The "mode(format)" field is too long.
kAPIFTCMSExtra	An extra field appeared in hostFileName.

CICS/VS

Return Code	Reason
kAPIFTBadFirst	Error with resource file or bad first character of hostFileName.
kAPIFTCICSTLong	hostFileName is too long.
kAPIFTCICSDot	A period appeared in the hostFileName.
kAPIFTCICSSpace	A Space appeared in the hostFileName.
kAPIFTBadChar	An invalid character appeard in hostFileName.

SNA•ps Access/3270 File Transfer Requests Usage

The SNA•ps Access/3270 File Transfer Requests may be used to send/receive a file to/from the Host. It is assumed in the following paragraphs that the Macintosh application/User has logged onto one of the supported host environments (TSO, CICS, VM/CMS).

To Send a file to the Host:

- Issue the StartSend request. If an error occurs, correct the error, and resubmit the request.
- Issue PollSessions.
- If the event returned was a kDoSendEvent, send one block of data to the host using DoSend. Note that SNA•ps Access/3270 will automatically segment this block if it exceeds the transport mechanism's maximum size.
- If the event returned was a kDoReceiveEvent, the file transfer is not successful, and the DoReceive request will likely return an error message that was received from the Host. Issue a DoReceive request.
- If the event returned was a kPSUpdateEvent, the host application has written a message into the PS, which may be displayed to the user. For example, this will occur in TSO if you exceed the disk space allocated for the file. Issue GetUpdate() to allow the file transfer to continue. OIA updates, which also occur in this manner, will be a fairly constant event during the course of the file transfer.
- Repeat the above sequence (starting at PollSessions) until the end of the file, then issue the DoSend request with a zero-length for the data and a

null send buffer pointer.
- Note that at any time the host application may cancel the file transfer. Be prepared to receive kDoReceiveEvents from the PollSessions call.
- Note that if a "Cancel" is issued, the host application may or may not return a message (as a kDoReceiveEvent) indicating the file transfer was canceled. You must receive these events or subsequent StartSend and StartReceive requests will fail with the error kAPIFTInProgress.

To receive a file from the Host:
- Issue the StartReceive. If an error occurs, correct the error and resubmit the request.
- Issue PollSessions.
- If the event returned was a kDoReceiveEvent, issue a DoReceive request. This request may contain an error message from the host (file not found, for example) or the first block of data.
- If the event returned was a kPSUpdateEvent, the host application has written a message into the PS, which may be displayed to the user. For example, this will occur in TSO if you exceed the disk space allocated for the file. Issue GetUpdate() to allow the file transfer to continue. OIA updates, which also occur in this manner, will be a fairly constant event during the course of the file transfer.
- Repeat the above sequence (starting at PollSessions) processing the kDoReceiveEvents until the host application sends a block with the host Reply field set to kMsgContent. The host normally sends only one (1) message after the end of the file. If an error occurs during the file transfer, the host application may send an error message.
- If a DoReceive request is issued specifying Cancel, SNA•ps Access/3270 will return kAPINoErr after sending the appropriate cancel command to the host application. The host application may then send a kClose event and a message, or it may simply send an error message. You must receive these events or subsequent StartSend and StartReceive requests will fail with the error kAPIFTInProgress.

See the section "Sample File Transfer Flowchart for an Apple 3270 API 2.0 User Program" for a more complete description.

File Transfer Request Formats

The next two sections detail the format of the requests/responses which flow between SNA•ps Access/3270 and the host application. These sections are provided for your use while attempting to decode a line trace of a file transfer request which may be failing.

PS Screen Formats

CUT-based file transfer uses three types of screens to communicate data from the host to the Mac. Each screen may be distinguished by the first character.

```
// character          Meaning
//   'A'  -    This is a Download format screen
//   'B'  -    This is an Upload format Screen
//   'C'  -    This is a Control format screen
```

```
     #define kMAX_PSFT_DOWN   1909   // Max Data from Host
     #define kMAX_PSFT_UP     1912   // Max Data to Host

     unsigned char  psftd_sequence;         // Block Sequence
     unsigned char  psftd_chksum;           // Checksum of screen
     unsigned char  psftd_len1;             // Length of data MSB
     unsigned char  psftd_len2;             // Length of screen LSB
     unsigned char  psftd_data[kMAX_PSFT_DOWN];   // Data being downloaded
     unsigned char  psftd_attr1;            // Unprotected Attr.
     unsigned char  psftd_resp[4];          // Area for PC to respond in
     unsigned char  psftd_attr2;            // Protected attr.
} PSFT_DWNSCRN;
```

D0 Structured Fields Subset

```
---------------------------
DFT-based File Transfer uses a subset of the D0 structured fields defined
as part of DDM.  These D0 structured fields flow as a Write Structured
```

Field (WSF) from the host (and with inbound AID of 0x88 to the host). A structured field has the following format:

```
struct SF {
   unsigned short length;        /* Length of SF */
   unsigned char   sf_id1;       /* First/only ID byte */
   unsigned char   sf_id2;       /* Second byte of ID or */
                                 /* first  byte of SF info */
   unsigned char   sf_data[1]    /* Contents determined by SF type */
};
```

The following D0 structured fields are used by the DFT-based File Transfer mechanism:

- 0xD000 - Open
  The Open function is used to make a logical connection between the file transfer and a specific file. The following is the format of the Open SF:

```
   00 23                          // Length of this field
   D0 00                          // SF Type (Open)
   12 01 06 01 01 04 03 0a 0a 00  // Fixed Information
   00 00 00 11 01 01 00 50 05 52  // Fixed Information
   03                             // Fixed Information
   F0                             // No Compression
   03 09                          // Fixed Information
   C'FT:DATA' or C'FT:MSG'        // Dummy file name
```

  Only two (2) file names are used in the Open request. 'FT:DATA' is used to generically represent the file to be up/down-loaded. The actual name of the file was communicated on the command line. 'FT:MSG' is used by the host application as the name of the file that messages from the host application are to be stored into. These messages come your application as 'kMsgContent' DoReceive events with SNA•ps Access/3270.

- 0xD041 - Close
  This request terminates the logical connection established between the local file and the remote (host) file. It is not always sent by all implementations of IND$FILE. The format of the Close request is:

```
   00 05     // Length
   D0 41     // SF ID (Close)
   12        // Fixed Information
```

- 0xD045 - Set Cursor
  This request is used by the host application to place the 'cursor' to the beginning of the next block to be sent. It is used for file uploads only. The format of the Set Cursor request is as follows:

```
   00 0F                          // Length
   D0 45                          // SF ID
   11 01 05 00 06 00 09 05 01 03  // Fixed Information
   00                             // Fixed Information
```

  The Set Cursor request is followed immediately by the Get request.

- 0xD046 - Get
  The Get request flows in both directions for file uploads. In the Outbound (from the host) direction, it flows immediately after the Set Cursor request. SNA•ps Access/3270 will send the next block of data from the 'file' using a Get request (which is really a response at this point). SNA•ps Access/3270 will check an internal queue for data to be sent. If no data is presently queued, a kDoSendEvent will be returned to the next PollSessions request issued which requests kDoSendEvents. The format of Get request is as follows:

```
From host application:
----------------------
00 09           // Length
D0 46           // SF ID (Get)
11 01 04 00 80  // Fixed Information

From SNA•ps Access/3270:
------------------------
XX XX     // Length (Depends on amount of data sent and segment size)
D0 46     // SF ID
NN NN NN NN    // Sequence number of this block
C0        // Fixed Information
80        // Data not compressed
DD DD     // Length of data that follows
DATA      // Data from DoSend command, possibly segmented
```

- 0xD047 - Insert
  This command is used by the host during file transfer to the Macintosh. It inserts the next block of data into the file. The block is always inserted at end of file. This always flows as two (2) Insert requests. The first is of fixed size and information. It informs SNA•ps Access/3270 that the insert is to be a sequential insert. The format of the Insert request is:

```
Fixed Insert:
-------------
00 0A           // Length
D0 47           // SF ID
01 05 00 80 00  // Fixed Information

Variable Insert:
----------------
XX XX     // Length
D0 47     // SF ID
C0        // Fixed Information
80        // Data not compressed
61        // Fixed Information
YY YY     // Length of data
DATA      // Data to be stored as next block of file
```

ABS Tech Note: SNA•ps09 Gateway Performance Tuning (5/92)

==========

Article Created: 29 May 1992

TOPIC ----------

This Technical Note details which parameters to modify when connecting a SNA•ps gateway to either an IBM mainframe or an AS/400 computer or to another personal computer running OS/2 Communications Manager. Dramatic improvements in SNA•ps throughput can be made by following these simple steps.

DISCUSSION ----------

Introduction

The application "SNA•ps Config", included with the SNA•ps Gateway package, allows changes to be made to SNA•ps gateway configuration files. Changes related to performance are those most commonly made using SNA•ps Config. Corresponding changes must also be made to the IBM partner for the modifications to be effective. The following suggestions allow for the optimum possible performance using SNA•ps. Note that SNA•ps "3270 Manager" can not be used to make performance related changes.

Large I-frame Sizes

The SNA•ps Token Ring default I-frame setting, located in the Line Description, is 265 (256 +9) bytes. Increasing this value can dramatically improve performance. The Apple Token Ring 4/16 NB card is required for this since a minimum of 1 Mb of memory is required on the card. Table 1 lists Token Ring line parameters that need to be modified for SNA•ps, PS/2, AS/400, or host configurations.

SNA•ps: Max I-field: length (Token Ring line definition)
PS/2: Receive: Buffer Size – IEEE 802.2 TR Profile
AS/400: MAXFRAME: Maximum Frame size (Token Ring line description)
(Controller desc: Maxframe size = *LINKTYPE)
Host: MAXDATA: Maximum number of bytes physical unit can receive (PU

definition)

Table 1: Token Ring Line Description Performance Tuning Parameters

The value of 2057 (2048 +9) bytes is recommended; however any value greater than 265 will improve performance.

The nine byte overhead, included with both the Apple Serial NB and Token Ring values, is used by SNA•ps for the transmission header (TH) and request header (RH) in the request unit (RU) segments.

The SNA•ps SDLC default I-frame setting, located in the Line Description, is 265 bytes. Increasing this to 521 (512 +9) bytes will provide similar improvements for SDLC communication. A minimum of 1 Mb of memory is required on the Apple Serial NB card. Table 2 lists the SDLC line parameters that need to be modified for SNA•ps, PS/2, AS/400, or host configurations.

SNA•ps: Maximum BTU (SDLC line definition)
PS/2: Maximum RU Size SDLC (DLC) adapter profile
AS/400: MAXFRAME (SDLC line description)
Host: MAXDATA: Maximum number of bytes physical unit can receive (PU definition)

Table 2: SDLC Line Description Performance Tuning Parameters

Force Segmenting (APPC only)

In order to achieve optimal performance, the RU size should be larger than the I-frame size. This forces the RU messages to be broken into multiple frames (that is segmented) boosting throughput. More specifically, the RU should be an even multiple of the I-frame size (that is 2x, 4x, and so on) minus the 9 byte overhead included in the SNA•ps I-frame value. Therefore, to improve APPC performance, increase the Maximum RU Upper value in the APPC Mode definition to 4096. Table 3 lists the parameters that need to be modified for the APPC Mode definitions for SNA•ps, PS/2, AS/400, or host configurations. Note that the OS/2 Communications Manager's "Verify" command will not allow the Maximum RU size on the "Transmission Service Mode Profile" to exceed the Maximum RU size on the "Data Link Control (DLC) profile."

APPC Programming Considerations

The largest possible amount of data should be sent in each "MC Send Data" and received in each "MC Receive and Wait" to ensure the best data transfer rates. The maximum record length supported by SNA•ps APPC is 32763 bytes. Therefore, 32763 should be used as the send length in each "MC Send Data", the receive length in each "MC Receive and Wait" and the map buffer length in "MC Allocate". "MC Receive Immediate" should not be used, since "MC Receive and Wait" has been optimized for performance. A buffer size equal to (or larger than) 18 K bytes should be used in the "Open Gateway Connection" connection request. See "Appendix K" in the SNA•ps APPC Programmers Reference for more details regarding gateway buffer sizes.

SNA•ps: Maximum RU Upper APPC Mode definition
PS/2: Maximum RU size Transmission Service Mode profile (should equal Max RU size in the DLC profile)
AS/400: MAXLENRU: Maximum length request unit (Mode description)
Host: RUSIZE S: Maximum RU Size (MODEENG definition)

ABS Tech Note: SNA•ps10 Access/3270 Internals (4/93)

==========

Article Created: 26 April 1993

TOPIC --

This technical note discusses the SNA•ps implementation of the Apple 3270 API. This includes general architectural issues, values returned by requests and localization issues. Also included are error codes returned by SNA•ps Access/3270 which are not listed in the Apple 3270 API Programmer's Manual.

DISCUSSION --

Introduction

SNA•ps Access/3270 is a full featured implementation of the Apple 3270 API over the SNA•ps gateway. All of the defined API requests are implemented providing LU1, LU2, and LU3 communication with the host.

Apple 3270 API clients should not generally need to know the details of the particular implementation of the API. This is because all implementations should fully adhere to the API specifications. This is true of the SNA•ps implementation, which was developed by the same team that designed the Apple 3270 API.

The API definition, however, does allow considerable variance in the form of returned values from API requests. The purpose of this technical note is to detail those returned values for the SNA•ps Access/3270 implementation of the Apple 3270 API. This knowledge is of value to 3270 API developers writing code to specifically handle the SNA•ps implementation of the API.

Overview

The SNA•ps Access/3270 file contains the access method code, the host connection code, the INIT code, (which loads the host connection) and a number of miscellaneous resources including icons and strings. The file is

located in the Extensions folder under System 7 and in the System Folder under System 6. Whereas the access method code is a code resource managed by 3270 Prep, the host connection code is implemented as a Macintosh device driver. The access method communicates with the host connection using the device manager's Control routine.

Access Method

The access method contains the following resources:

- 3270 - Contains information about the access method returned in the FindAccessMethods request:

```
methodName    - SNA•ps Gateway    // Access method name
hcPrompt      - Gateways:         // Prompt for host connection dialog
appMem        - 8000              // Amount of application heap required
version       - 0x200             // Encoded API version number
connType      - kAppleTalkEntity  // Connection type (zone name
                                  // required)
hostLangHndl  - 0                 // Place holder for handle to list of
                                  // host languages.
theICNLID     - 150               // ICN# Resource ID
theicl4ID     - 150               // icl4 Resource ID
theicl8ID     - 150               // icl8 Resource ID
theicsLID     - 150               // ics# Resource ID
theics4ID     - 150               // ics4 Resource ID
theics8ID     - 150               // ics8 Resource ID
lcrsID        - 128               // LCRS Resource ID
trtpID        - 128               // TRTP Resource ID
hlidID        - 128               // HLID Resource ID
```

- HLID - the CGCSGID and keyboard ID for the language always supported by the host connection. While the host language and keyboard ID below refer to the base English language, note that these are subject to localization:

```
hostLangID    - 0x00650025      // The CGCSGID for the host language
keyboardID    - 1               // The keyboard ID for the host language
```

- Icons - ICN#, icl4, icl8, ics#, ics4, and ics8 all with ID 150 are the icons used to represent
the SNA•ps Gateway and are returned by FindAccessMethods.

- LCRS - the access method code resource.

- STR# - three strings lists are defined:

```
ID 2000 - contains error strings for the SNA•ps specific error codes in
          the -8500 to -8999 range.
ID 2001 - is a place holder for error strings for the general error codes
          in the -8000 to -8499 range.
ID 2002 - contains string(s) used by the access method.  Currently this
          includes only the driver name.   If you change this string, you
```

must change the driver name in the DRVR resource to match it.

- TRTP - a resource which describes which translation resources are required for a language to be considered valid. For this implementation, a given language is considered valid if its resources are from files with any creator ('????') and there are resources of type AtoE, EtoA, PtoE, and EtoP for a given language. AtoE and EtoA stand for ASCII to EBCDIC and EBCDIC to ASCII respectively. These API defined tables translate between Apple 3270 API ASCII and the EBCDIC code page for the given language. PtoE and EtoP stand for PC ASCII to EBCDIC and EBCDIC to PC ASCII respectively. These two table implementation defined resource types are used by the file transfer requests.

Each of these request does the following:

- OpenAccessMethod - Opens the driver in the SNA•ps Access/3270 file and allocates a small block of memory for access method storage. It then passes the request to the driver for processing.

- CloseAccessMethod - reverses the action of OpenAccessMethod. The request is given to the driver for processing, and then memory is freed.

- PollSessions - this request is not passed to the driver for processing. Instead, the driver and the access method have a locked shared PollSessions request block. The driver issues PollSessions requests on behalf of every API user during its periodic processing. Any events that have occurred are indicated in this shared request block. When an application issues PollSessions, the access method code looks at the shared PollSessions request block and copies any events returned into the passed PollSessions request block. This saves the overhead of the device manager calls for this time critical and frequently called request .

- GetErrorString - Returns error strings for all errors if they are included. Currently only SNA•ps specific errors are returned.

Host Connection

The SNA•ps Access/3270 implements the host connection as a device driver loaded by an INIT at boot time. This host connection code is a linked Macintosh application (called DrvrApp) with a device driver shell. The device driver code interfaces to the device manager with DrvrApp. The INIT loads all of DrvrApp's code resources into the system heap and builds the application jump table and global area. When a request is issued by an API client, the access method issues a call to the device driver's Control procedure. This routine sets up the application environment before passing the request to DrvrApp for processing. The combination of code and memory used by the driver is approximately 180K. DrvrApp handles all of the requests not handled by the access method.

The following lists information about the SNA•ps implementation of selected requests:

- FindHostConns - The passed parameter, zoneStr, is required by this (SNA•ps Gateway) implementation. If set to nil or *, the local zone name

is used. The following describes interesting parameters returned in the HostConnInfo structure:

```
hcName           - the AppleTalk entity object field for a SNA•ps
                   Gateway.
strangerName     - not used in this implementation.  Always set to zero
                   length string.
defaultLang      - set to the base English code page.  This is the same
                   value that is contained in the HLID resource.
hcStatus         - kStranger is never returned.
sessTypes        - is always set to the bitwise OR of kLU1Mask, kLU3Mask,
                   and DisplayMask.  This reflects the fact that a SNA•ps
                   gateway always supports LU1, LU2, and LU3 session
                   types regardless of how it's configured.
structuredFields - always set to true indicating that the host connection
                   has code to support structured fields even if a
                   particular session may not carry structured fields.
ftSupported      - always set to true indicating file transfer support.
                   IND$FILE is the one file transfer type supported.
dbcsSupported    - always set to true indicating that the host connection
                   has code to support DBCS data even  if a particular
                   session may not carry DBCS data.
```

- OpenHostConn - The passed parameter, zoneStr, is required by this (SNA•ps Gateway) implementation. If set to nil or *, the local zone name is used. If you try to activate an already active gateway, an error will be returned. When trying to activate or get the status (in FindHostConns or OpenHostConn) of a gateway, the following errors can be returned:

```
kCapyPermission      -8520   // Not authorized to download gateway
kCapyBadConfigVers   -8521   // Not a proper configuration
kCapyMSizeError      -8522   // Configuration too big
kCapyTooManyLUs      -8523   // Too many LUs for your gateway package
kCapyNotEnoughSysMem -8524   // Ran out of system heap in DynamicDownload
kCapyMCPLoadNoFWD    -8525   // Couldn't find the Forwarder
kCapyMCPLoadNoMem    -8526   // Gateway failed to get memory
kCapyToManyUsers     -8527   // Maximum of number of gateway clients
                             // exceeded
```

- FindSessions - The following describes interesting parameters returned in the HostConnInfo structure:

```
keyPrompt     - is returned as "Enter password:" but should not be used
                since a session key is not required.
sessTypes     - if the particular session type is known (i.e. the session
                is bound) then a specific value will be returned here:
                kLU1Mask for an LU1 session, kDisplayMask for am LU2
                session, and kLU3Mask for an LU3 session. If the
                particular session type is not known, then the configured
                device type is used: if the device type is printer then
                kLU1Mask ORed with kLU3Mask is returned.  If the device
                type is display, then kDisplayMask is returned.
modelRequired - is always set to false.  The screenEmul field in
```

```
                OpenSession is not  required to specify a specific model
                type.
  keyRequired   - is always set to false.  The sessionKey field in
                OpenSession is not used.
```

- OpenSession - you can define a DAB containing the kFieldValidation attribute, but those DAB values will always be returned as zeros. The sessionKey field is not used. On rare occasions, OpenSession will incorrectly return a kAPISessNotFound error. This happens when more than 30 seconds have passed without a response from the gateway since the gateway was sent the verb to allocated the indicated LU. This is an unusual situation which only happens if there is extreme network load or if the gateway machine is unresponsive.The default language is used in OpenSession when either a nil hostLangDef pointer is passed or when a count of zero langauges is passed (SNA•ps v1.1.1).

- PollSessions - when an API client issues this request, the access method only returns an event that had been previously posted for that client. The actual scanning of sessions and posting of events happens in the driver during periodic time. For display sessions, events are returned in this order of priority: kSessionStatusEvent, kPSUpdateEvent, kDoSendEvent or kDoReceiveEvent, and kPassThruDataEvent. For LU1 sessions, events are returned in this order of priority: kSessionStatusEvent, kLU1DataEvent, and kPassThruDataEvent. For LU3 sessions, events are returned in this order of priority: kSessionStatusEvent, kLU3DataEvent, and kPassThruDataEvent.

- SendKeys - the following control keys are not supported and will result in an error being returned from the SendKeys request: kCKTrigger, kCKExtSelect, kCKTest, kCKTextOnOff, kCKFISymSet, kCKCursPos, kCKCursBlink, kCKAltCurs, kCKMultLogicalTerm, kCKEADocOn, kCKEADocOff, kCKEAChangeFormat, kCKEAWordDelete, kCKEAWrap.

- CopyOIA - of the defined group indicator bits, the following are NOT returned: kSetupMode, kTestMode, kSubsystemReady, kExtendedSelect, kAPL, kKana, kAlpha, kText, kUpperShift, kPSSOperSelect, kPSSFieldInherit, kNonResetMachineChk, kSecurityKey, kMachineCheck, kRetry, kDevNotWorking, kDevVeryBusy, kDeviceBusy, kMinusSymbol, kNotEnoughEntered, kWrongNumber, kNumericField, kOperUnauth, kInvalidDeadKey, kMessagePending, kPartitionWait, kHardwareMismatch, kLogTermNotConfAtCU, kAutoKeyInhibit, kAppProgHasOpInpInh, kPSSSelected, kRspTimeMonitor, kPrintCodeNotCust, kPrinterMalfunction, kPrinterPrinting, kAssignPrinter, kWhatPrinter, kPrinterAssignment, kPlay, kRecord, kRecordingOverflow, kPause, and kWindowIsEnlarged.

- StartSend - the only file transfer type supported is IFIL. All other types will result in an error. kOtherHost is an unsupported value for the hostEviron field.

- StartReceive - the only file transfer type supported is IFIL. All other types will result in an error. kOtherHost is an unsupported value for the hostEviron field.

- QuerySession - returns Structured Field and Query Reply information as listed below. Returns IFIL as the only supported file transfer type. The transportType field is always returned as kDFTSNATransport. The LU type is returned as kUnknownLU before a session is bound. The replyMode field is set to kUnknownReplyMode if a session is not bound or if it's a bound LU1 session. The sfSupport support field remains at kSFSupportUnknown until a BIND has arrived at which time it is either kSFSupported or kSFNotSupported.

Structured fields processed:
  Read Partition
  Erase/Reset
  Set Reply Mode
  Destination/Origin
  Outbound 3270DS
  D0 Structured Fields (if file transfer active)
  SCS Data (for LU1 sessions)

Query Replys issued:
  Null
  Usable Area
  Character Sets
  Implicit Partition
  Color
  Highlighting
  Reply Modes
  DDM
  Field Outlining
  Paper Feed Techniques
  Settable Printer Characteristics
  3270 IPDS
  DBCS(Asia) - if DBCS supported.

Error codes

The following error codes are specific to the SNA•ps Access/3270 API implementation:

kCapy2ndOpenAM	- Second OpenAccessMethod call in access method. Impossible condition.
kCapyADSPErr	- ADSP error while communicating with the gateway or gateway agent
kCapyAMPError	- AMP protocol error while communicating with the gateway agent.
kCapyAbortReqLogic	- Internal logic error in AbortRequest
kCapyAddUserErr	- Internal error opening access method (aka adding a user).
kCapyBadSessName	- Illegal LU name (session name).
kCapyCAMLogic1	- Internal logic error #1. Invalid reserved field.
kCapyCAMLogic2	- Internal logic error #2. Invalid reqID field.
kCapyCallDrvrErr	- Internal logic error. Nil DrvrApp entry point.
kCapyCantFindAM	- Internal logic error. Returned in debug version only.

```
  kCapyFHCLogicErr1    - Internal logic error.  PLookupName call failed.
  kCapyFHCLogicErr2    - Internal logic error.  NBPExtract call failed.
  kCapyFTIntrnlErr     - Internal file transfer logic error.
  kCapyGWayCommyErr    - Error communicating with the gateway.
  kCapyGWayConnErr     - Can't establish a gateway connection.
  kCapyGWayErr         - Error communicating with the gateway.
  kCapyInvGlobs        - Internal logic error.  Access method reserved
                         field invalid.
  kCapyNoIPCQueue      - Internal logic error.  Returned in debug version
                         only.
  kCapyOpenDriverErr   - Error opening the SNA•ps Access/3270 driver.
  kCapyResErr          - Error loading resources.
  kCapyPermission      - Not authorized to download gateway
  kCapyBadConfigVers   - Configuration isn't correct
  kCapyMSizeError      - Configuration too big
  kCapyTooManyLUs      - Too many LUs for your gateway package (invalid
                         configuration)
  kCapyNotEnoughSysMem - Ran out of system heap in DynamicDownload
  kCapyMCPLoadNoFWD    - Couldn't Find The Forwarder
  kCapyMCPLoadNoMem    - Gateway failed to get memory
  kCapyToManyUsers     - Maximum of number of gateway clients exceeded
```

Localization

There are two aspects to localization of the SNA•ps implementation of Apple's 3270 API. The first, user visible strings, are contained in STR, STR#, and 3270 resources. The second is the default host language provided if the Host Translation Tables folder either doesn't exist or doesn't contain the default language resources. To change the default language from base English, you must change the HLID resource to contain the new CGCSGID and keyboard ID values, and then replace the AtoE and EtoA tables in SNA•ps Access/3270 to contain the new language tables.

Security: Everyone

ABS Tech Note: SNA•ps11 SNA•ps Q&A (4/93)

==========

Article Created: 26 April 1993
Article Reviewed/Updated: 26 July 1993

TOPIC

This technical note lists the most frequently asked questions regarding SNA•ps. The questions are sorted among three categories: SNA•ps 3270, 3287 and 3270 API, Installation and Gateway.

DISCUSSION

SNA•ps 3270, 3287, and 3270 API

SNA•ps 3287 Foreground/Background Printing Modes

Q: Why does SNA•ps 3287 print in the foreground on the LaserWriter LS (and other direct-connect printers that have background capabilities, such as the StyleWriter, HP PaintJet, and HP Deskwriter/C)?

A: This limitation arises because there isn't a way to determine whether background printing is supported by a given printer driver. Also, SNA•ps 3287 needs to prevent the user from doing anything while printing to a direct-connect ImageWriter. The combination of these two factors forces SNA•ps 3287 to handle the situation as you describe. See Technical Note: "SNA•ps05 3287 Tips," for detailed information and a possible workaround.

SNA•ps 3287 Memory Requirements

Q: I get warnings about low memory while running SNA•ps 3287.

A: Increase SNA•ps 3287's memory size using the Finder's Get Info command. SNA•ps 3287 has a default partition of 450K. Each additional page of unprinted accumulated data requires one half K of RAM, therefore, to hold 200 pages of unprinted accumulated data, you need 550K. If you run out of memory by accumulating too many unprinted pages, SNA•ps 3287 will warn you and stop receiving data from the host until some memory is freed by pages being printed and deleted. See Technical Note: "SNA•ps05 3287 Tips," for detailed information about SNA•ps 3287 memory usage.

Note: SNA•ps 3287 v1.1.1 changed the default timeout setting to include a 200 page timeout limit. At the default memory size of 512K, SNA•ps 3287 can guarantee having enough memory to accumulate and then print 200 pages without running out of memory. The new default setting simply guarantees that SNA•ps 3287 can be installed and used without fine-tuning the timeout settings even if print jobs arrive continuously.

Does SNA•ps 3270 use the Apple 3270 API?
Q: Does Apple's 3270 API support both SNA•ps 3270 GC and SNA•ps 3270 direct?
A: Apple's 3270 API is a programming interface which is used to give host access via a variety of connection methods (both Apple and third party). SNA•ps 3270 GC and SNA•ps 3270 are separate products which currently are not written to the 3270 API interface.

Apple 3270 API - What files are necessary?
Q: Which files are necessary to run applications written to the Apple 3270 API?
A: The following files must be located on the 3270 API client machine in order to allow the client to access SNA•ps Gateways:
ADSP 1.5.1 (only required with system 6.0.x)
3270 Prep 2.0.1
SNA•ps Access 1.1.1
Apple's 3270 API implementation is written specifically to support the SNA•ps Gateway. The necessary file for 3270 API connectivity via SNA•ps is SNA•ps Access/3270. This file contains Apple's implementation of the API. As long as these files are on a client machine, applications written to the API will work properly via a SNA•ps Gateway.

SNA•ps Installation

SNA•ps v1.1.1 and v1.0 Compatibility
Q: Can I freely mix v1.0 and v1.1 clients and gateways?
A: The SNA•ps 1.1.1 and 1.0 Gateway packages are not compatible - always use a SNA•ps Access and a SNA•ps Gateway of the same version. Applications such as SNA•ps 3270 will run over either version of SNA•ps Access (SNA•ps 3287 requires SNA•ps Access v1.1.1 and a v1.1.1 Gateway). See tech note "SNA•ps01 Version Compatibility" for more details.
Note: SNA•ps versions 1.1 and 1.1.1 are completely compatible.

SNA•ps - System Software requirements
Q: What version of the system software is required for a SNA•ps Gateway?
A: SNA•ps 1.1.1 uses A/Rose 1.1.8, which will not run on system 6.0.5. You MUST upgrade to system 6.0.7, 6.0.8, or 7.0.x in order to run the 1.1.1 Gateway.

SNA•ps Gateway won't initialize because machine isn't named
Q: I loaded a SNA•ps Gateway on a machine on which System 7.0 was recently installed, and the SNA•ps Gateway won't initialize because I haven't named my machine.
A: If you are using System 7.0, SNA•ps requires that the owner and name of the machine in the sharing setup control panel must be provided. It is

advisable to set this before installing the SNA•ps Gateway.

System Files required for SNA•ps Client Access

Q: We're upgrading our SNA•ps servers and clients from version 1.0 to 1.1.1. We use the Installer application to upgrade the Gateways, and we'd like to use our own automated upgrade utility to upgrade the client machines. Can we distribute only the SNA•ps Access without the other system files and without using the Installer? If we need to distribute the other system files, which versions do we need for System 6.0.5? Are the system files distributed with the SNA•ps software compatible with 6.0.5?

A: The Installer isn't required for upgrading your client machines. The only system files required on client machines are ADSP and SNA•ps Access. You'll need ADSP 1.5.1 for System 6.0.x machines (ADSP hasn't changed since SNA•ps 1.0.1 was released). However, Apple doesn't support System 6.0.5 when using SNA•ps 1.1.1. System 6.0.7 is the earliest system software version tested for compatibility with SNA•ps 1.1.1.

What does the SNA•ps install do?

Q: When running the Installer to install a SNA•ps 1.1.1 workstation, does the SNA•ps software only copy files, or does it install resources in the system?

A: The SNA•ps installer software only copies files.

SNA•ps - System 7.0 memory requirements

Q: I'm having memory problems when running SNA•ps client software on an Macintosh LC with 2 Meg of memory and System 7.0

A: Please see the release notes for information regarding running in this configuration. Generally, 2.5 Meg of RAM is recommended when running SNA•ps with System 7.0.

SNA•ps Gateway

SNA•ps Independent/Dependent LU Support

Q: The SNA•ps Gateway will not let us define a mix of dependent and independent LUs. We need to support parallel conversations over LU 6.2 and also provide 3270 sessions. Is there any way to do this?

A: The limitation is that the gateway does not support dependent and independent LUs on the same line/partner (PU). There are several workarounds for this. If you are using SDLC, you can define a multi-drop configuration, (see the sample multi-drop config). This will allow you to run both Dep and Indep on the same SDLC line. If you are using Token Ring, then you will need to define two lines and two partners in a single configuration, the partners should have different SAP addresses to the same TIC. Then you define Dep and Indep LUs separately on the two line/partner combinations (one partner is type 2.1 the other is type 5). Alternatively, you can have two partners with different XIDs to the same TIC (one PU Dep the other Indep). Either approach will provide the functionality you need.

SNA•ps - Token Ring 4/16 Support

Q: Version 1.0.1 of the SNA•ps Gateway will not run on an Apple 4/16 TokenTalk NB Card. (We can make it work on Apple's previous Token Ring

card but not on the current product). Does version 1.1.1 fix this? If so, how fast can we get version 1.1.1?

A: Yes, version 1.1.1 is needed. This is currently shipping. You should send in for a free upgrade. All customers who purchased MacDFT or SNA•ps version 1.0 products are eligible for a free upgrade to the respective SNA•ps version 1.1.1. product. To receive a free SNA•ps 3270 version 1.1.1, SNA•ps 3270 GC, SNA•ps Gateway/8, SNA•ps Gateway/32 or SNA•ps Gateway/64 upgrade kit, send (1) proof-of-purchase such as an original SNA•ps 1.0 disk, MacDFT disk, or invoice and (2) your name, company name, address (no P.O. boxes, please), and telephone number to

Apple Computer, Inc.
Promotional Support
Attention SNA•ps 1.1.1 Upgrade
P.O. Box 4055
Cupertino, CA 95015

Please allow 3 to 5 weeks for processing and delivery. For non-U.S. customers allow an additional 3 to 5 weeks.

Defining Transaction Program Names

Q: We can't find a way to use dynamically defined Transaction Program Names (TPNs). They must be pre-configured in the Gateway. What's the trick?

A: Yes, TP names are defined statically. However, you can use the wildcard "*" to match any TP name.

Defining LU Names - AS/400 Connection

Q: We have a problem with LU 6.2 sessions, using our Apple 4/16 Token Ring adapter card with OS/400 2.1.1 on the AS/400. The Token ring line, Controller, and Device all show status of ACTIVE. The virtual controller QPACTL01 has been created and is showing status of ACTIVE. The virtual devices for this controller are showing status of VARY ON PENDING. We're getting an SNA negative response with sense code of 0806, which indicates a request reject, resource unknown. Why we are having problems with this mode?

A: In the SNA•ps configuration under Remote LU 6.2's Characteristics you want the "Network LU Name" to be set to DVIAS400. In the trace you sent us the AS/400 is sending that as its local name and the SNA•ps Gateway is rejecting it because it doesn't know about the name DVIAS400. The name field in the Remote LUs 6.2 is for local use by SNA•ps transaction programs, and is not the network name field used to BIND with the AS/400. The Network LU Name is the name you should be using.

How Do Modes Get Activated?

Q: We're experiencing difficulties with SNA•ps modes getting disabled when we restart it from SNA•Admin. Our configuration file has the "Automatically activate" checkbox set for every mode. Most modes are activated when our gateway starts up, but some are not. When we try to use connections with disabled modes, we get communications errors. Should the modes be enabled automatically when the gateway restarts? Can some other event cause them to be disabled? If external events can cause a mode to be disabled, is there any way for us to tell when this happens?

A: There are a number of reasons for sessions not coming active. Please check that you have selected the "minimum prebound" setting if you wish

sessions to automatically come active. If this is selected, then you'll need to check the line trace to determine why the binds are being rejected. There are numerous reasons for this, such as configuration mismatch or resource shortages. The sense code information associated with the bind rejects will give a clue to the cause. These types of messages will be logged in the SNA•ps log facility. All binds and session establishment problems are routinely logged. But again, a line trace may be necessary for more exact information regarding the reasons for the failure. See Tech Note "SNA•ps04 Bullets" for more information.

Support for Third-Party Token Ring Cards

Q: I have a question about a configuration for using the SNA•ps Gateway over a token ring connection. If I have several Macintosh systems with DCA (formerly Avatar) 4/16 token ring cards in them (and that's their only connection to each other; no LocalTalk connections), can I put one Apple TokenRing card in one of the Macintosh systems and put the SNA•ps Gateway software on that Mac and use that one as the gateway for all the other Macs? In other words, can the Macs that contain only Avatar token ring cards somehow communicate through the one Macintosh that has the Apple token ring card and the SNA•ps Gateway?

A: This will work fine. If you don't have an DCA (formerly Avatar) card in the machine running the SNA•ps gateway, you'll still need to run TokenTalk on that machine. For the Apple Token Ring 4/16 card use TokenTalk 2.4; for the TokenTalk 512K board use TokenTalk 2.2

Problems Starting Gateways

Q: When we try to start our SNA•ps Gateway, we get a message similar to the following: "Couldn't open gateway connection to server. Please make sure gateway machine is running." Since this is the gateway machine, I'm pretty sure it is running. Any suggestions or ideas?

A: This message indicates some problem with ADSP or A/ROSE. Make sure the card is secure in the slot, or try moving the card to another slot or replacing the card. You can use nprm to diagnose the problem. Nprm is a utility which allows status messages from the gateway, running on the NuBus card to be displayed on the Macintosh screen. You can obtain Nprm through the normal Apple Support Channels.

SNA•ps Connection to an AS/400 - Autoconfigure Option

Q: Is there some setting that would hinder the AS/400 from autoconfiguring devices and modes? Even though the autoconfig parameter is set to *YES, it doesn't always create devices and modes, particularly when the SNA•ps Gateway is set to host mode.

A: You need to two autoconfig parameters: With WRKSYSVAL, there's a parameter QAUTOCFG that says whether to autoconfigure devices (default=yes). In the line description, there's a parameter that says whether to autoconfigure controllers (default=no).

SNASVCMG Mode - What is it?

Q: What is mode SNASVCMG?

A: SNASVCMG stands for SNA Service Manager, and is used by SNA•ps for managing parallel sessions.

Revised: 9/7/93
Security: Everyone

ABS Tech Note: SNA•ps12 APPC Samples (10/92)

==========

Article Created: 28 October 1992

TOPIC ----------

This tech note contains information regarding the SNA•ps APPC Developers Kit sample applications. Information on the following subjects is presented (examples are specific to the AS/400):

- Security issues
- Improvements to APDA samples
- General performance tips

DISCUSSION ----------

Security issues - AS/400 Example

The APDA APPC sample applications can easily be modified to pass userID/password security. Change the MC Allocate request setting security = kProgSec and fill in the userID and password parameters. This may be necessary if you are having problems passing userID/password security on the Allocate conversation request. Prior to OS/400 v1r3, the default user for programs invoked via APPC was QUSER (a low privilege user) and the APPC sample application programs worked successfully. Starting with OS/400 v1r3, the security was tightened so that AS/400 APPC transaction programs cannot be started without a valid userID/password combination. A symptom of the problem is a "Program Start Request rejected" message on the QSYSOPR message queue of the AS/400.

Improvements to The Sample Applications

The APPC sample applications as they are currently distributed contain a slight mismatch. The AS/400 thinks it is dealing with a record size of 4096 bytes, but the Macintosh is really sending 4092 bytes. This is due to the way mapped conversations work. The Mac does a MC Send Data with length set to 4096 bytes, but the first 4 bytes are reserved, so the AS/400 receives only 4092 bytes of data. This can be corrected by changing the AS/400

source code and ICF file to do reads/writes of 4092 bytes and changing the record length of the AS/400 physical file to 4092. Alternatively, changing the Macintosh TP to perform a MC Send Data with the length parameter set to 4100 will correct the mismatch.

Performance

Substantially improved performance (reduces the time by 50%) can be obtained by specifying "binary" in the AS/400 open statement:

```
fopen(as400name, "rb type=record")
```

Further improvements can be obtained in the case where multiple file transfers occur. If the AS/400 application is re-written to remain active (that is handling multiple file transfer requests) until the Mac application deallocates, the overhead of allocating a conversation for each file transfer is eliminated.

Prestart Jobs - AS/400

Performance improvements can be obtained by prestarting the job on the AS/400. This increases performance since there is no startup time when the program is invoked. Creating a new subsystem or modifying the job's priority can also yield increased performance. Use the following commands to set-up the prestart option:

End Subsystem: ENDSBS QCMN
Create a class for QCMN (QSYS/QCMN)
Work With Class: WRKCLS - change the job run priority from 50 to 30
Add Prestart Job Entry: ADDPJE - add Prestart job entry for example MYLIB/FILECSVR (it is possible to designate a class to give your application a different priority than other prestart jobs in the same subsystem).
Start Subsytem: STRSBS QCMN

SNA•ps Tuning

Modify the I-frame size in the SNA•ps line description, the maximum RU size in the SNA•ps mode, and the buffer size used by the APPC sample application TP. A combination of I-frame size=4105, max RU=4096, and application record size=4092 has been found to work fine.

ABS Tech Note: SNA•ps13 Admin Trace v1.1.1 (4/93)

Revised: 9/3/93
Security: Everyone

ABS Tech Note: SNA•ps13 Admin Trace v1.1.1 (4/93)

==========

Article Created: 26 April 1993

TOPIC

This technical note discusses the fixes and outstanding feature limitations of SNA•ps Admin v1.1.1 Trace facility. It also provides some hints on how to get the most out of the tracing facility.

DISCUSSION

Introduction

The SNA•ps Admin v1.1.1 Trace facility addresses two of the problems in the previous version: BIND type Decoding and the Coax Trace Decoding. In addition, the Trace facility is now faster.

Problems fixed

- BIND type Decoding: The BIND responses were sometimes displayed with the wrong LU type. This problem has been fixed and the BIND response now displays the correct LU type.

- Coax Trace Decoding: On a coax gateway, the DVINFO message was improperly decoded as if it had a TH and RH SNA header on the data. The DVINFO message is now decoded correctly.

Outstanding problems

- Truncated Data: The Trace data is truncated at 256 bytes. This is a problem when you are running in an environment that has larger BTU sizes and you are interested in the data near the end of the frame.

- Lost Frames: Because of the limit on buffer space available on the gateway machine, trace data can be lost. This occurs when data is arriving at the gateway faster than SNA•ps Admin can display it on the screen or store it in a file. The gateway can only buffer 32K bytes of

trace data before losing data.

- V25bis Info: Some V25bis autodial commands will not appear in the line trace.

How to make the trace work better for you: "Helpful Hints from Steve"

The trace loses frames because SNA•ps Admin can't copy the trace data from the gateway as fast as it arrives on the line. The gateway has a limited capacity to buffer the data. The faster SNA•ps Admin can copy the data from the gateway, the less data will be lost.

There are several things that you can do to speed up SNA•ps Admin:

- Run SNA•ps Admin on the Gateway machine: Running SNA•ps Admin on the same machine as the gateway improves performance because the data does not need to traverse the AppleTalk network.

- Close Windows: When running the trace, you should close the SNA•ps Admin Network Gateway Status window, and the Gateway Status window. Keeping these windows open and up to date reduces the amount of time SNA•ps Admin can devote to copying the trace data.

- Shut down other Applications on the machine: Having any other application open on the machine will slow down SNA•ps Admin.

DAL: DB2 Host Date/Time For Time Stamp (3/93)

Revised: 3/8/93
Security: Everyone

DAL: DB2 Host Date/Time For Time Stamp (3/93)

==========

Article Created: 1 March 1993

TOPIC ----------

I want to use the date and time as data in a DB2 database in a client/server environment. I can not use the date and time of the Macintosh, because it is not necessarily the same among Macintosh client stations.

Is it possible to obtain and use the date and time of the DAL server as data for our DB2 database? (The data will be use as an historical events registry and the date and time is essential). How can I do this?

I currently use DAL-VTAM to communicate with DB2. The client is a 4D application using 4D-DAL.

DISCUSSION ----------

DB2 supports access to two system-level data items called:
• Current date
• Current time

DAL does not support the use of these "reserved words", or special data items, at this time.

In the meantime, we can think of only one "work-around" if you are willing to do the following:

1) Create a table with two fields:
Create table datetime (datefield date, timefield time);

2) Grant all access to this table to public.

3) In your application do the following set of DAL statements. (What we're doing here is having you request the system date & time, update

the one-record table with that information, and use that information for a timestamp in whatever way you need.) This may not be the best solution, but it is the best we can offer at this time:

3.1 Execute in DB2:
"delete * from date_table";

3.2 Execute in DB2:
"insert into date_table values (current date, current time)";

3.3 In your application:
select datefield, timefield from datetime;

3.4 Use these values as you need.

We haven't been able to test this solution completely - our DB2 won't allow any new tables because the disk (VTOC) is full - but we feel pretty sure that this is close to the correct SQL, and you should be able to work it out yourself if there are any minor errors.

LaserWriter Pro: Test Print Shows All Drives as External (3/93)

Revised: 3/16/93
Security: Everyone

LaserWriter Pro: Test Print Shows All Drives as External (3/93)

==========

Article Created: 9 March 1993

TOPIC ----------

The LaserWriter Pro 630 user test print doesn't indicate that an internal SCSI hard drive is installed. Instead, the test print denotes the internal hard drive as an external SCSI device. Is this normal?

DISCUSSION ----------

The LaserWriter Pro 630 does not differentiate between an internally or externally connected SCSI device. Therefore, whether the hard drive is internally or externally connected, the user test print will always indicate that the hard drive is an external device.

Multiple Drives: Long Periods of Disk Activity During Startup

Revised: 3/2/93
Security: Everyone

Multiple Drives: Long Periods of Disk Activity During Startup

==========

Article Created: 2 March 1993

TOPIC ----------

I have a Macintosh running System 7, and four disk drives attached. The disks are accessed at startup for long periods of time. Is something writing to all the drives, like a virus? I can't restart or shut down while the disk activity is going on.

DISCUSSION ----------

When starting up the Macintosh with four disk drives under System 7, disk access is constant and moves from drive to drive during the first few minutes after seeing the desktop. If you choose Shut Down or Restart from the Special menu, nothing happens until the disk activity stops.

The Macintosh is configured with File Sharing ON. At startup, File Sharing reactivates, and this may take some time depending on the number of drives. While File Sharing is starting up, you can select Restart and Shut Down but they won't take effect until File Sharing is ON.

You can monitor the state of File Sharing via the Sharing Setup control panel (it will say either OFF, starting up, or ON). Restart and Shut Down commands can't complete while File Sharing is starting up. The Finder doesn't notify the user of this and will perform the shutdown or restart after File Sharing is ON.

PowerBook Duo: Video Setting Default (3/93)

Revised: 5/31/94
Security: Everyone

PowerBook Duo: Video Setting Default (3/93)

==========

Article Created: 3 March 1993

TOPIC ----------

My PowerBook Duo 230 is connected to the Macintosh Duo Dock, with an E-Machines ColorLink Video card and Apple monitor. If the Duo is removed from the Dock, and then returned to the Dock, it doesn't "remember" the previous setting and starts up in monochrome. Why is this?

DISCUSSION ----------

The System software's Start Manager expects to see the specified card installed, and when the Duo is not docked it defaults to the first available video resource, which is the Duo's built-in monochrome display.

DAL: Canceled Query Hangs (3/93)

Revised: 3/8/93
Security: Everyone

DAL: Canceled Query Hangs (3/93)

==========

Article Created: 2 March 1993

TOPIC ----------

I'm having a problem whenever a user cancels a query from GQL. I get an error message "Can't access the host". Here is the information about my DAL environment.

DAL Environment

DB2 maint level : 9206 release 2.3
MVS maint level : 9006
VTAM main level : 9006
Using Jes2
System ESA but VTAM is XA version 3.3
Network connection: SNA•ps APPC
SNA•ps APPC version: 1.1b3.
DAL VTAM Server : 1.3.5
DAL Client : 1.3.7
Using GQL. This is where the cancel problems are occurring.
Also using Dataprism.

DISCUSSION ----------

You should purchase the 1.1.1 release of SNA•ps.

We've checked with two engineers, one for the SNA•ps APPC network adapter and one for the Client driver.

There is no way for an APPC connection to issue the break command to the server. This is a limitation of the protocol. Therefore, attempting to use the break function on an APPC session can cause confusion and some messiness.

You might think the server is in a loop, but it's not; it's just continuing to process the DBMS command which was given to it previously. It will not see the client as gone, and the network connection will remain open. This means that the LU will be tied up in an active session in the gateway, and the userid will be "in use" to the server.

In the testing we did (with GQL 3.0) we were able to determine two methods of dealing with the problem. One way is probably what a Macintosh user would do and the other is what he should do.

What a Macintosh User Probably Will Do
---

1) Issue the break command.

2) May not wait until GQL finishes processing the break, or the break may "hang".

3) Force quit the GQL application.

4) MUST restart the Macintosh to clear the DAL Client driver -- if not the Macintosh can get really hung when DAL is next accessed.

5) Attempt to re-use GQL/DAL.

6) Notice that the connection attempt just "hangs", never seems to return.

7) Check gateway, see session number.

8) Get frustrated!

What You Should Do
---

1) When the break command is issued to GQL, wait patiently for it to complete its processing and re-activate the mouse. This means more than just being able to move the mouse, it means being able to click on the GQL query window and close it.

2) Quit GQL and request "Close" of connection.

3) When GQL quits completely, the APPC session will still be active in the gateway. Any attempts to reconnect with that LU, or with that userid and a different LU will not succeed and may "hang" the application.

4) Request the console operator to answer the outstanding "request for reply" for the server with the following command:

   nn, cancel,userid (where nn is the request number)

   This will cancel the APPC session and free the LU in the gateway.

5) To actually complete the cancel of the userid in the server, you must use the DAL Monitor to cancel the userid. This is done by logging onto the Monitor by a command such as:

   logon applid(dalserve) data(tpn=dalmon)

6) Hit 'enter' twice and you will see a listing of the active users in the server. Type a 'C' on the line for the userid to be cancelled. This will complete the cancellation of the userid in the server.

7) Steps 5 and 6 can be done in the reverse order, but both methods are required for a complete cancellation and clean-up. The first cancel will terminate the APPC session and the second cancel (which MUST be done by the OTHER method!!) will cancel the userid from the server and DB2.

Until the session is terminated and the userid canceled, the server believes that the userid is still connected and will not allow the userid to make another connection.

DAL doesn't support the "break" feature for APPC connections. It is possible to cancel queries made with any of the 3270 protocol network adapters (SNA•ps 3270, MacMainFrame, Netway, etc.) to the VTAM server.

LaserWriter Pro: HP Emulation and Font Support (3/93)

==========

Article Created: 10 March 1993

TOPIC ----------

Do the LaserWriter Pro 600 and 630 support HP LaserJet emulation? If so, which HP LaserJet printers do they emulate? Which fonts do the LaserWriter Pro 600 and 630 support in HP mode?

DISCUSSION ----------

The LaserWriter Pro 600 and 630 do support HP LaserJet emulation. They emulate the HP LaserJet IIP printer, which supports HP PCL4+.

As with the HP LaserJet IIP printer, the only fonts accessible with the LaserWriter Pro in HP emulation mode are Courier and LinePrinter. Since there is no LinePrinter font built into the LaserWriter Pro, Courier is the only font available. No other fonts in the ROM of the LaserWriter Pro are available for use in HP emulation mode. (Note: This also holds true for the LaserWriter IIf and IIg and Personal LaserWriter NTR, since they also emulate the HP LaserJet IIP).

By the way, there is actually a bug in the HP emulator that inadvertently allows access to the Helvetica and Times-Roman fonts if the HP IIP assigned font values are used in the escape code to change typefaces.

For example, the escape code to change typefaces is:

ESC(s#T

where # is the font value

3, 4, 5 are the assigned font values for Courier, Helvetica, and Times-Roman respectively.

So, if "ESC(s4T" is sent to the printer in HP emulation mode, then the printer will use the Helvetica font. Again, this is a bug, but it seems to work if you want Helvetica or Times-Roman output.

Since Helvetica and Times-Roman are proportional fonts, remember to use these escape codes to switch to proportional spacing:

"ESC(s1P"

to turn ON proportional spacing,

"ESC(s0P"

to turn OFF proportional spacing (when using monospace fonts).

Hard Drive: If It Slows When Going from 68030 to 68040 (3/93)

==========

Article Created: 4 March 1993
Article Updated: 31 August 1994

TOPIC ----------

My external hard drive was originally initialized by a Macintosh IIcx. Now that it's attached to a Quadra 950, the hard drive appears to be slower. What might cause this?

DISCUSSION ----------

If you install System software on a hard disk drive using a 68030-based system and later use that same drive with a 68040-based system, you may notice that the hard drive's burst rate is limited to roughly 1.3MB/second instead of the approximately 3MB/second it should be.

This happens because the Cache Switch control panel is not installed and the default in that case seems to be off. You don't need to reinstall System software on the 68040 system. Just drop the Cache Switch control panel into the System Folder to restore the full performance of the hard drive data transfers.

Personal LaserWriter NT: SuperATM Message and ROM Upgrade

Revised: 4/5/93
Security: Everyone

Personal LaserWriter NT: SuperATM Message and ROM Upgrade (3/93)

==========

Article Created: 9 March 1993

TOPIC ----------

A README file from Adobe's SuperATM application reads: "If you are using an Apple Personal LW NT printer which does not have upgraded ROMS from Apple, your application may not be able to print substitute fonts. Please call customer support for assistance."

Is there a ROM upgrade for the Personal LaserWriter NT?

DISCUSSION ----------

Adobe Systems, Inc. told us that this message concerns the ability to use the Substitute Font functionality (part of the Multiple Master Font technology) of SuperATM. SuperATM uses new technology not present in the version of ROM that is in the Personal LaserWriter NT. Thus, customers must upgrade to a Personal LaserWriter NTR if they want to use this specific function.

Adobe has included an addendum sheet in their SuperATM package which also states this.

There are no plans to provide a ROM upgrade for the Personal LaserWriter NT.

Macintosh Performa: Monitors Control Panel Settings (3/93)

Revised: 3/9/93
Security: Everyone

Macintosh Performa: Monitors Control Panel Settings (3/93)

==========

Article Created: 8 March 1993

TOPIC ----------

I have a Macintosh Performa 600 and 1MB VRAM. After I set the colors to Thousands in the Monitor control panel, the computer works fine with Thousands colors. But when rebooting, the system sets the color to 256 colors.

DISCUSSION ----------

Performa system software (7.0.1P, 7.1P, 7.1P1) was initially configured to always set the Monitors control panel to 256 colors (if capable) upon restart. This was done so that a novice user couldn't turn on their Macintosh for the first time and have the system come up in black and white. (Potentially this could make the customer think something was wrong with their "color" system.)

The problem, as you have discovered, is that you may want to intentionally set the Monitors control panel to black and white or take advantage of additional VRAM and leave the Monitors control panel set to Thousands.

This has been corrected in Performa system software 7.1P2.

A/UX: Duplicate Characters Within mail ~ Command (4/95)

Revised: 4/26/95
Security: Everyone

A/UX: Duplicate Characters Within mail ~ Command (4/95)

==========

Article Created: 5 March 1993
Article Reviewed/Updated: 26 April 1995

TOPIC ----------

I am using mail by rlogin to a Sun from the command shell application on A/UX 3.0. Whenever I type a ~ (tilde) command, it is duplicated on the screen. For example, when I type ~v, the command shell echoes ~v~v. This happens only with ~ commands and not other characters. I looked at the terminal characteristics under the command shell, and they were set to the defaults. The terminal type is set to VT100.

When I connect to the Sun from Mac OS via VersaTerm, I don't get this problem. In addition, other Suns rlogging do not have this problem.

DISCUSSION ----------

We have experienced the same symptom. Although the mail command shell echoed (~v~v for example) on the screen, it still performed its task.

We think the problem is a conflict in using the SAME escape character '~' between the 'rlogin' and the 'mailx' program. The 'mailx' program uses the '~' character as an executing command within mail. While the 'rlogin' program uses the DEFAULT '~' character for escaping the rlogin session.

You could avoid the symptom by changing the rlogin escape character to another\ character via the -e option of the rlogin command line. For instance:

rlogin grumpy -e@ -l dchen

This uses the '@' character instead of the default '~' character.

ABS Tech Note: DAL21 AS/400 Install Doc Update (2/93)

Revised: 9/7/93
Security: Everyone

ABS Tech Note: DAL21 AS/400 Install Doc Update (2/93)

==========

Article Created: 26 February 1993

TOPIC ----------

This Tech Note contains additional information about the Data Access Language for AS/400 Server installation. These items should be noted as changes, additions, or clarifications to the "Data Access Language Server for AS/400 Installation Guide, Version 1.3.7".

More information on IBM's AS/400 system can be obtained directly from the relevant IBM publications.

DISCUSSION ----------

Informational

The following informational items are true of the server at release 1.3.7, as loaded from the distribution tape/cartridge with a volume serial number of "DAL137":

- Page 9, "Restore the DAL distribution library from tape" (Step 3 of "Installing the server"): this action will result in 57 objects being restored and 114 security or data format changes occurring.

- Page 10, "Restore the demonstration database tables" (Step 5 of "Installing the server"): this action will result in 11 objects being restored and 22 security or data format changes occurring.

These object and format counts may change with future releases of the server. For that reason this information is not included in the published documentation; since it is informative, it is included in this Technical Note for clarification.

Change required

- Page 12, "Prepare to run the DALINST command" (Step 7 of "Installing the

server"): the 'Display System Value' command is not accurate. It should be: 'DSPSYSVAL SYSVAL(QSYSLIBL) <enter>'

- Page 27, "Create an SQL view with a statement similar to" (Step 3 of "Creating an SQL view" in Appendix B, "Displaying Table Lists"): the "• Note" is not accurate. It should be: "library/DALDBV01".

Clarification

Appendix B, "Displaying Table Lists" describes the two methods that can be used to create the list of tables that an individual user (or the entire site) will see when the DAL Client command 'Describe Tables' is executed. When issued, this command creates a list of available tables that are visible to the Client. Please note that DAL uses the SQL standard format of "Creator.Tablename" instead of the AS/400 standard of "Library/File" when displaying this table list.

In the AS/400 environment the table list can actually be a list of:

- Libraries and Files: displayed in the "Creator.Tablename" format as "LibraryName.FileName"

- SQL collections and tables: displayed in the "Creator.Tablename" format as "Collection.Tablename"

- A combination of both libraries and SQL collections

When using DAL in the AS/400 environment, it is important to note that the entire file system is available for display in the table list if no View has been created, or if it has been created improperly. This is because DAL is reading a system-wide directory in the AS/400 environment, not just a DBMS system catalog (as with other DAL Server environments). This search can be quite lengthy and may cause confusion for the user, as it will probably not reflect what that user should actually be able to see and access using DAL.

It is also important to note that the AS/400's object authorization is the final authority of what a user can access. For example, when issuing a 'Describe Tables', a user may be able to see many files and/or library names in the table list. If, however, that user does not have object authority granted for a specific item, they will not be able to see column/field names, nor the actual data for all items listed as a result of a 'Describe Tables'.

As installed, there is a site-level view created which will display only the demonstration tables shipped with the DAL for AS/400 Server. A new site-level view, or set of user-specific views, must be created to display a table list which is pertinent to the desired information for the site or user(s). For more information, see "Review/modify the environment file" (Step 9 of "Installing the server").

Creating an SQL view

Page 27, "Create an SQL view with a statement similar to" (Step 3 of "Creating an SQL view" in Appendix B, "Displaying Table Lists") explains how to create an SQL view that will result in the desired list of libraries and file names. To create this view requires that you have the SQL/400 licensed product, not just the SQL/400 runtime libraries.

The entry that is listed on page 27 requires clarification: if you are creating a view for a specific user, you must first create a library with the userid as the library name and then create the view substituting the library name (which is the same as the userid) in place of "library" in the 'CREATE VIEW' statement. Use the 'STRSQL' (Start SQL) function of the AS/400 while you are signed on as QSECOFR to create this view.

If you wish to define a view with the exclusions stated in the Install guide on page 27, which are:

- entries with null file or library names
- source files (DBXTYP would be an 'S')
- all libraries or collections starting with 'Q'
- all files starting with 'QDICT',

the following is the correct SQL/400 'CREATE VIEW' statement:

```
CREATE VIEW library/DALDBV01
     AS SELECT DBXFIL, DBXLIB, DBXOWN, DBXATR, DBXNFL, DBXTYP
          FROM QADBXREF
          WHERE NOT DBXLIB = ''     (there is no space between the quotes)
               AND NOT DBXFIL = ''
               AND NOT DBXTYP = 'S'
               AND NOT SUBSTR(DBXLIB,1,1) = 'Q'
               AND NOT SUBSTR(DBXFIL,1,5) = 'QDICT'
```

If you wish to allow the user to see a list of ALL the libraries (limited as specified above) EXCEPT for a specific one, use the following:

```
CREATE VIEW library/DALDBV01
     AS SELECT DBXFIL, DBXLIB, DBXOWN, DBXATR, DBXNFL, DBXTYP
          FROM QADBXREF
          WHERE NOT DBXLIB = 'LibraryName'
               AND NOT DBXLIB = '' (again, no space between the quotes)
               AND NOT DBXFIL = ''
               AND NOT DBXTYP = 'S'
               AND NOT SUBSTR(DBXLIB,1,1) = 'Q'
               AND NOT SUBSTR(DBXFIL,1,5) = 'QDICT'
```

To limit the user to see ONLY a specific library, the command should be:

```
CREATE VIEW library/DALDBV01
     AS SELECT DBXFIL, DBXLIB, DBXOWN, DBXATR, DBXNFL, DBXTYP
          FROM QADBXREF
          WHERE DBXLIB = 'LibraryName'
               AND NOT DBXFIL = '' (again, no space between the quotes)
               AND NOT DBXTYP = 'S'
```

```
                AND NOT SUBSTR(DBXFIL,1,5) = 'QDICT'

          Multiple libraries can be chosen with the addition of:

                OR DBXLIB = 'LibraryName'

          for each additional library.
```

Similar syntax can be used to limit the display of files within a library. Please refer to the "AS/400 Structured Query Language/400 Reference and Programmer's Guide" for additional information on creating a valid 'SELECT' statement for the 'CREATE VIEW' statement.

Creating a view from a logical file

If you do not have the SQL/400 licensed product, you must create a logical file rather than creating the SQL view as documented above. Page 27, "Create a logical file" (in Appendix B, "Displaying Table Lists"), tells you how to create a logical file that will result in the desired table list. Page 28 shows the source that must be changed and then used as the basis for creating the individual logical file for each user.

The following examples explain the results that will be displayed after creating the logical file using the source file given as an example in Appendix B, as well as changes you can make if you wish to restrict the libraries/SQL collections that will be displayed. Note that this source code is column sensitive. You can refer to the AS/400 "Data Description Specifications Reference" manual for complete instructions on modifying these source control statements.

To present the user with a list of all libraries and files in the AS/400, you need only create the logical file without changing the source file (as loaded from the tape and documented on page 28). The source file is 'QDDSSRC' in the 'DALLIB' library and the 'Create Logical File' command is documented on page 28 in the last paragraph.

If you wish to allow the user to see a list of all the libraries except for a specific one, change the source to have the DBXLIB statement as:

```
     O DBXLIB       COMP (EQ 'LibraryName')
```

instead of:

```
     O DBXLIB       COMP (EQ '           ')
```

To limit the user to see only a specific library, change the source to have the DBXLIB statement as:

```
     O DBXLIB       COMP (NE 'LibraryName')
```

instead of:

```
     O DBXLIB       COMP (EQ '           ')
```

Note that both examples use negative compare logic; the 'O' preceding DBXLIB in the statement means "omit all that pass the following COMPare". Attempts to change this logic to a positive COMPare with the use of 'Select' instead of 'Omit' were not successful when tested at Apple. Thus, the statements documented here are the recommended logic. Just be careful with those compares.

ABS Tech Note: DAL26 VAX/VMS Long Passwords (4/93)

Revised: 9/7/93
Security: Everyone

ABS Tech Note: DAL26 VAX/VMS Long Passwords (4/93)

==========

Article Created: 26 April 1993

TOPIC ----------

This Technical Note describes that with DAL on VAX/VMS the passwords must be 20 characters or less.

DISCUSSION ----------

Even though VAX/VMS account passwords may be 0 to 32 characters long, to use DAL the passwords must be 20 characters or less in length. If an account password that is longer than 20 characters is used, an Error #-10632 will result. When trying to connect to a VAX/VMS host via the DAL Tester, the following messages will be displayed:

```
1: Message: Host error - Invalid userid or password
1: Disconnected.
```

In order to work around this problem, shorten your account password to 20 characters or less in length.

ABS Tech Note: SNA•ps14 APPC Security (2/93)

Revised: 9/7/93
Security: Everyone

ABS Tech Note: SNA•ps14 APPC Security (2/93)

==========

Article Created: 26 February 1993

TOPIC --

LU 6.2 provides a powerful transaction processing facility . Along with this power comes the responsibility for verifying access to network resources (that is LUs, TPs). This technical note describes two functions SNA•ps provides to assist the administrator in providing APPC security, namely: LU-LU verification and end user verification.

DISCUSSION --

Introduction

SNA•ps provides several levels of security for APPC users. LU-LU verification is a session-level security protocol, invoked at the time the session is activated. End-user verification is a conversation-level security protocol, taking place at the time a conversation between two TPs is started. This technical note describes the procedure for configuring and using these security features.

Note: it is only necessary to configure for end user verification when LU 6.2 applications are being remotely started at the Macintosh (that is the SNA•ps gateway is receiving attaches, that is FMH–5's).

LU-LU Verification

Partner-LU verification is accomplished during session establishment, with each LU using an LU-LU password and the Data Encryption Standard (DES) algorithm. LU-LU passwords are defined on a partner -LU basis: one LU-LU password is established between each LU pair and used for all sessions involving the pair.

To configure SNA•ps to use LU-LU verification, use SNA•ps Config to edit the remote LU resource. Enter the session password parameter matching the partner LU's password. If the passwords match exactly, the session is

established; if not, then no session is enabled.

Note: LU-LU passwords are established by installation and implementation-defined methods outside of SNA. Example: for the AS/400 set the LOCPWD parameter associated with the AS/400 device description.

End User Verification

Partner end user (for example, transaction program) verification is a conversation-level security protocol used to control access to remote TP applications. When a TP wishes to access another TP, it must supply adequate security information in the allocate conversation request to satisfy the requirements at the remote LU, or the request will be rejected. A user ID, password, and profile may be specified in the allocate request that will cause the receiving LU to check an authorization list before a specific TP is started. Each LU indicates at session activation time whether it will accept LU security parameters on allocation requests the partner LU sends.

It is only necessary to configure SNA•ps for end user verification when LU 6.2 applications are being started at the Macintosh (that is the Macintosh TP is receiving attaches (that is FMH-5's).

To configure SNA•ps for end user verification, use SNA•ps Config to set up user IDs and profiles for a local LU. Next assign user IDs and profiles from the associated local LU to the specified transaction programs. This is done after selecting the TP security level you wish to use. Specifying conversation level security indicates that the userid, password and profile in the allocate request will be checked, but that no TP access verification is to be performed. If one of the Access level security selections are made, this specifies that resource-level security will be validated using the authorization list specified for the TP. Next, use SNA•ps Config to edit the remote LU resource so that conversation security is selected. The pre-verified selection indicates that the local LU will accept conversation-level security without requiring a password Therefore, pre-verified should only be used if the sender is trusted by the receiver to have performed the proper verification of the user ID.

Note: the APPC protocol does not encrypt end-user passwords.

..TIL11739-ABS_Tech_Note-SNA-ps15_APPC_Return_Codes_2-93.pdf

Tech Info Library

ABS Tech Note: SNA•ps15 APPC Return Codes (2/93)

Revised: 9/7/93
Security: Everyone

ABS Tech Note: SNA•ps15 APPC Return Codes (2/93)

==========

Article Created: 26 February 1993

TOPIC ----------

This technical note discusses return codes obtained by SNA•ps APPC applications.

DISCUSSION ----------

Introduction

The purpose of this technical note is to detail those return codes for the SNA•ps APPC implementation which have changed or were omitted from the SNA•ps APPC Programmer's Reference.

Overview

SNA•ps Access is located in the Extensions folder under System 7 and in the System Folder under System 6. Programmers wishing to access APPC services on the Macintosh make calls to the SNA•ps Gateway via the SNA•ps Access file. SNA•ps Access is loaded at system startup time and provides all the necessary resources to access APPC calls.

SNA•ps Gateway 2.0 Changes

The SNA•ps Gateway 2.0 implements a new packaging scheme based on the number of connected SNA•ps Client machines, rather than the number of configured Logical Units as in previous releases.

Applications written to the SNA•ps Access API will need to handle a new error condition that can be returned from the Open Gateway Connection verb. The error occurs when the gateway rejects the request because the number of client machines limit has been reached.

If SNA•ps Access 1.1.1 or greater is on the client machine, an ioResult value of -4105 (kTooManyUsers) will be returned to the application.

If SNA•ps Access 1.1 is on the client machine, an ioResult value of -4099 (kConnFailureErr) will be returned to the application.

The SNA•ps APPC Developer's Kit will not be revised in conjunction with the SNA•ps Gateway 2.0 release. The new ioResult value will be incorporated into a subsequent release of the SNA•ps APPC Developer's Kit.

Undocumented SNA•ps Return Codes

The APPC API return values majorCode = 5, minorCode =12, obtained from the Allocate verb call, indicates that the SNA•ps gateway doesn't have enough memory to start an additional conversation. This is normally a temporary "low memory" condition and the application may retry the allocation. If the problem persists, more memory should be added to the NuBus card running the gateway (Apple Serial NB and TokenRing 4/16 NB cards are expandable to 1 or 2.5 Mb). SNA•ps Config can also be used to reduce the memory required for the SNA•ps gateway by decreasing the number of sessions and LUs, or by reducing the I-frame size.

A common programming error is that application developers do not issue Deallocate (deallocType ==kLocalDealloc) when a previous verb has completed leaving the conversation state as DEALLOCATED. The conversation resources are not freed until the TP application issues a Deallocate (deallocType ==kLocalDealloc) , Close Local LU or Close Gateway Connection. Over time, this can use up the available memory for the Gateway and cause the above mentioned error code to be returned.

The APPC return code majorCode = 1, minorCode =123, resulting from the Receive Allocate call, indicates that Open Local LU was issued with receiveAlloc = kFalse. This is corrected by specifying receiveAlloc = kTrue in the Open Local LU call.

These missing error codes will be incorporated into the header file SNAErrors.h the next time the APPC Developers Kit is updated.

ABS Tech Note: SNA•ps16 Independent LU Config (2/93)

Revised: 9/7/93
Security: Everyone

ABS Tech Note: SNA•ps16 Independent LU Config (2/93)

==========

Article Created: 26 February 1993

TOPIC ----------

This technical note describes the configuration of SNA•ps independent 6.2 LUs.

DISCUSSION ----------

Introduction

SNA•ps supports both independent (ILU) and dependent (DLU) 6.2 LUs. Significant differences exist in their abilities to handle sessions. Primary among these differences is the capability of independent LUs to support parallel sessions. The use of parallel sessions has a number of advantages and they are simple to define and easy to manage using SNA•ps Config and SNA•ps Admin.

Overview

The term dependent/independent LU is based on whether or not an LU is dependent on an SSCP for session establishment (and has an SCCP-LU session).

An independent (of an SSCP) 6.2 LU can act either as a primary LU (can send a BIND) or as a secondary LU. Hence, a SNA•ps ILU can establish a session (send a BIND) with another ILU. On the other hand, a dependent 6.2 LU is always a secondary LU (must wait to receive a BIND). A further distinction is that an ILU has the ability to have parallel and multiple sessions while a DLU is always restricted to a single session with a partner LU.

Independent LUs and Network Qualified Names

Unlike DLUs, ILUs do not have LU-IDs associated with them. IBM uses LU-IDs equal to zero to specify that an LU is SSCP-independent in some of its implementations.

Note: To determine if an LU is dependent or independent - examine a line trace showing the BINDs.

Since independent LUs are identified by name rather than ID, it is important that the names associated with these LUs be unique throughout the network. Qualified names help ensure that when communicating across networks (that is multiple domain systems), all LU names will be unique. For this reason it is highly recommended that network qualifiers be used for both DLUs and ILUs whenever communication across SNI (SNA Interconnect) networks. In general, the use of network-id qualified names when communicating using ILUs is recommended.

Specifying Independent LUs using SNA•ps Config

Using SNA•ps Config, select the peer option for the partner resource. If the gateway (that is PU) network name and network qualifier are known, enter these as well.

Next, edit the Local LU name in the APPC resource, entering the network LU name and qualifier. The network LU name and qualifier, defined as characteristics of the local LU, together constitute the name that will be issued in the BIND. Generally this will match the name of the locally defined LU, but this is not necessary.

Edit the remote LU resource. Select the parallel session option for the remote LU and enter the network LU name and network qualifier for the LU defined locally at the remote system. You will notice that the LU ID field for the remote LU is grayed out. The SNA•ps gateway will automatically set the LUID=0. You do not need to enter LUID=0 using SNA•ps Config.

Edit the Mode resource, making sure that the maximum sessions defined at both systems are equal. The contention winners parameters defined at both systems should total the maximum sessions. This parameter determines which of the two LUs has the right to control use of the session. If the two LUs attempt to initiate a conversation on the same session simultaneously, the LU that is contention winner for that session will succeed and the other, the contention loser, will fail.

Note: When using a SNA•ps gateway for terminal emulation to an AS/400, configure the SNA•ps contention winner parameter equal to the number of simultaneous users who will be performing terminal emulation at any given time (that is configure SNA•ps contention winners equal or nearly equal to the maximum sessions). This will minimize the session establishment overhead and provide optimal performance.

Independent LU Administration

Parallel sessions are managed through the use of an IBM architected Change Number of Session (CNOS) transaction program. SNA•ps simplifies use of Independent LUs and parallel sessions by shielding the users from having to deal directly with CNOS. The SNASVCMG mode, visible using SNA•ps Admin, is automatically created for use by the CNOS TP and always has two sessions

defined. One of these session is contention winner the other contention loser. The SNASVCMG mode must always be activated prior to activating any user defined modes. Once the SNASVCMG sessions are active, the user mode can be activated and sessions will be displayed.

ABS Tech Note: SNA•ps17 Dowstream Configuration (2/93)

Revised: 9/7/93
Security: Everyone

ABS Tech Note: SNA•ps17 Dowstream Configuration (2/93)

==========

Article Created: 26 February 1993

TOPIC ----------

A method for connecting SNA•ps to a host system "downstream" of an OS/2 gateway is presented.

DISCUSSION ----------

Introduction

OS/2 Extended Edition v1.2 and later has an SNA gateway feature that allows PC's to connect to a host through an OS/2 gateway machine. The host is only aware of the gateway machine, which appears to be a single PU2 with (potentially) many LU's. To the client (workstation) PC's, the gateway machine appears to be a host connection (PU4)

It is a simple procedure to configure a SNA•ps gateway to connect "downstream" of an OS/2 gateway.

For the purposes of this technical note we will limit discussion to the scenario with token ring for both links: host (3720 front end processor) to OS/2 gateway and OS/2 gateway to SNA•ps gateway.

Procedures - OS/2

To configure the OS/2 gateway machine:

- Re-install Communications Manager with an already created configuration file that uses SNA Gateway so that CM has the necessary pieces.

- In the CM configuration file, under SNA Features, choose SNA gateway profiles.

  There are two parts:

  - Host Connection: enter token ring address of the front end processor (3720 or 3174) with gateway feature.

  - Workstation LU: make an entry for each LU to be redistributed to downstream workstations. Enter the local address (LU ID) as it is known at the host and as it is known at the workstation (they need not be the same). Also enter the token ring address of the workstation (in this case, the Mac acting as a SNA•ps gateway). This method pre-allocates LU's to a particular workstation; it is also possible to create pools.

- The OS/2 machine ignores some of the negotiations in the XID and may send I-frame packets larger than those configured for SNA•ps . In the case where SNA•ps I-frame size is limited to 265 (for example low memory situation on the TR card), lower the RU size from 1920 to 256 under SNA Profiles/DLC profile/Token Ring in the CM configuration.

Procedures - SNA•ps

On the SNA•ps gateway, enter the following information in the configuration:

- Create a token ring line.

- Create a partner line. Choose Host type connection, enter the token ring address of the OS/2 machine for link address, and enter the Gateway XID as it is known by the host (in the NCP). If the host connection is through a 3174 gateway, this may not be necessary (but the 3174 configuration will need to know the token ring address of the OS/2 machine).

- Create LUs - the LU ID should match one of those configured in the Workstation LU configuration on the OS/2 machine. Warning: OS/2 displays the LU ID in hex, while SNA•ps uses decimal.

- To obtain optimal performance and where memory is available on the SNA•ps TR card, change the Max I-frame in SNA•ps Config's Line dialog to be the value in SNA Profiles/DLC profile/Token Ring in the CM configuration + 9.

Macintosh Serial Port: Maximum Speed (1/96)

Revised: 1/30/96
Security: Everyone

Macintosh Serial Port: Maximum Speed (1/96)

==========

Article Created: 8 March 1993
Article Reviewed/Updated: 30 January 1996

TOPIC ----------

It appears that the maximum speed that I can drive the Macintosh serial port is 9600 bps when also communicating to a printer or other AppleTalk device.

I need to drive the modem port at 19.2 kbps while communicating to a AppleShare file server. The Macintosh cannot keep up with the DEC terminal server under the above circumstance. Is there any test data that would confirm or debunk my observation?

DISCUSSION ----------

This article addresses Macintosh computers slower than the Macintosh IIfx. For those systems, the information from the following "d e v e l o p" magazine article presented is accurate.

For 68040 and PowerPC based desktop Macintosh computers, the limit is higher. While no official testing has been done to identify the exact limit of each platform, customers have reported error-free 14.4kbps, 19.2kbps, and 28.8kbps connections with simultaneous LocalTalk connectivity.

All 68030 based Macintosh PowerBook computers are impacted by the 9600bps limit. The 68040-based PowerBook computers have a higher limit (56.6kbps) and customers have reported successful 28.8kbps connections with simultaneous LocalTalk connectivity.

Maximum communication speeds of the Macintosh Serial Ports are limited when both ports are used simultaneously. What follows is an article from issue 9, Winter 1992 (pages 86-88), of "d e v e l o p - The Apple Technical Journal."

Question: When my hardware device sends data to a Macintosh at 57.6 kbps,

characters can get lost if LocalTalk is on and a file server is mounted. Does Apple know about the problem? Is there a solution?

Answer: The specification for the top speed of the serial port on a Macintosh is an absolute maximum given that no other processing or use of the SCC are present. Although the speed of the Macintosh IIfx has now allowed this ceiling to be reached in the presence of other processing, it is just not attainable on other models of the Macintosh except when the machine is dedicated to this purpose. While AppleTalk remains active there is no guarantee on serial port data transmissions over 2400 bps. The same processor must handle the OS, the Serial driver and the AppleTalk driver (with no advantage of DMA), so the overhead is considerable. Because of the AppleTalk driver's considerations for incoming serial data, users can usually work at up to 9600 bps without any problems. All models in the current product line, except the Macintosh IIfx, are unable to sustain throughput with baud rates beyond 19.2 kbps except when exclusively dedicated to that task.

There is essentially no way to guarantee 100% serial data acquisition when using AppleTalk. This is due to the fact that while the Macintosh is receiving an AppleTalk packet, interrupts are disabled for the duration of packet transmission. What this means in a "worst case" situation is that a 603-byte packet (the largest possible AppleTalk packet) sent to the serial port would take approximately 26 milliseconds to receive. Compare this with asynchronous serial data transmitted at 9600 bps which would only take 1 millisecond to receive. A very realistic situation arises in which 26 bits could be lost during a concurrent AppleTalk/Serial Device transmission. The possibility is further strengthened when there are routers on the network, which send out large RTMPs (Routing Table Maintenance Packets).

To alleviate possible data loss, the AppleTalk driver interrogates the serial port at key times that won't interfere with packet reception. However, the checks are not at regular intervals; they are encoded in the driver as stated above. This means that these random checks may not coincide with the demands of the serial driver, and an occasional character is lost.

This same loss of characters may also occur in conjunction with the Sony driver. If a disk is inserted and it requires special attention (like formatting) then the odds of losing characters is increased. The Sony driver has built-in considerations like the AppleTalk driver (although not as frequent). So you can still lose data at high transfer rates if a disk is inserted during the transfer.

The character dropout also occurs on systems which are not currently running AppleTalk but are receiving serial transmissions from high-speed devices (57.6 kbps) and are performing CPU tasks which require a high amount of memory access (such as a CPU like the Macintosh IIsi or IIci running on-board video in 8-bit mode, or a CPU using VM).

There is, however, a way to ensure reception of high-speed serial data without character loss—through the use of a Serial NuBus card or other third-party NuBus cards with a dedicated processor necessary to provide higher speeds. The cards in essence operate as dedicated port-handling
circuitry. They are able to perform necessary buffering while the processor is

servicing other interrupts. This is the reason that network cards such as EtherTalk and TokenTalk can accomplish lossless transactions; they do at least some of their own buffering until being serviced to avoid interference with other operations like receiving serial data.

Alternatively, you may want to develop a custom card yourself that exactly fits the needs of your product. In this case you should look into the Macintosh Coprocessing Platform (MCP) and Apple / Real-time Operating System Environment (A/ROSE) as a basis of this line of development. Development packages for both these products are available from APDA.

Duo Dock: How Far It Ejects the PowerBook Duo

Revised: 5/31/94
Security: Everyone

Duo Dock: How Far It Ejects the PowerBook Duo

==========

Article Created: 10 March 1993

TOPIC -----

When the Macintosh Duo Dock ejects a PowerBook Duo, how far should the PowerBook Duo be ejected?

DISCUSSION -----

As a general rule, the PowerBook Duo is ejected from the dock approximately 2.5 inches (6.3 cm). This is a typical measurement, not a minimum or maximum.

It's similar to a VCR ejecting a video tape: if you can easily grab the Duo and pull it out of the machine, then the Duo Dock is operating correctly.

Express Modem: Hayes AT Command Set (3/93)

Revised: 3/30/93
Security: Everyone

Express Modem: Hayes AT Command Set (3/93)

==========

Article Created: 29 March 1993

TOPIC ----------

This article lists the AT command set for the PowerBook Express Modem.

DISCUSSION ----------

STANDARD AT COMMANDS

AT Attention code
-- --------------
All commands must begin with the attention code AT or at; the remainder of the command line contains commands for the modem. If AT is sent alone (that is, it is followed by <CR>), no command is executed but an OK result code is returned.

, Pause
- -----
This modifier introduces a delay time before dialing the next dial character or executing the next modifier in the dial string. The pause time is the value of the S8 register. Default = 2 seconds.

A Enter answer mode
- -----------------
The A command forces the modem to go off-hook in answer mode. The modem then starts sending the answer tone (CCITT answer tone independent from the B setting) unless the modem is set for leased line mode (&L command). If no carrier signal is received from the telephone line within the number of seconds specified by register S7, the modem goes on-hook, sends the NO CARRIER result code to the host, and returns to command state. If a dial tone is found, NO CARRIER is sent as a result code. Otherwise, the modem attempts to set up the carrier and, if successful, sends the appropriate CONNECT XXX

result code.

This command must be the last on a command line. Sending any character to the modem during call establishment cancels the command and generates a NO CARRIER result code. This command is not valid while the Express Modem is connected to a remote modem and in command state (after the escape sequence).

Bn Modulation protocol preference
-- ------------------------------
This command determines which protocol standard will be used for the next connection. Settings B0 and B1 apply only when ATN0 is selected and register S37 ≠ 0. Setting B2 overrides all settings of ATN and register S37.

B0	Default - When negotiating between a Bell or CCITT mode, selects CCITT V.21 or V.22 modes.
B1	When negotiating between a Bell or CCITT mode, selects Bell 103 or Bell 212A modes.
B2	Uses CCITT V.23 modulation only.

Cn Carrier control option
-- ----------------------
This command always returns OK. It is ignored and not saved in any profile.

Ds Dialing
-- -------
The dialing command first makes a connection on the telephone network with the telephone number specified in the character string s (call setup). If the remote modem answers, it continues with the carrier handshake procedure. After connection or failure to connect, the modem returns a result code with a status of the connection. (The precision of the result code depends on the last Xn command issued.) Sending any character to the modem during call establishment cancels the command and generates a NO CARRIER result code. In the simplest form, s consists of actual dial digits. This set of dial digits consists of the following characters: 0 to 9 (in pulse mode these are the only valid digits), A or a, B or b, C or c, D or d, *, and #.

Before sending the first digit, the modem waits for the dial tone, unless a comma begins the string or “blind dialing” is enabled. (See the X command.) Several dial modify subcommands, which can be part of the dial string, allow the modem to perform special dialing functions. These additional subcommands (also called dial modifiers) can precede, be embedded in, or follow the actual number to be dialed. Other characters not included in this set of modifiers are ignored while dialing and do not interrupt the dial process.

P Pulse dial
- ----------
The P modifier determines the use of Pulse dialing. Dialing speed is determined by the value of S11; the Make/Break ratio is determined by the &Pn command. These parameters can be changed only in certain countries. Any dial characters following the P modifier are dialed using pulse dialing until the T modifier is encountered. This modifier can appear anywhere in the dial string.

T Touch-tone dial (DTMF)

The T modifier determines the use of Touch-tone dialing. Any dial characters following the T modifier are dialed using DTMF dialing until the P modifier is encountered. This modifier can appear anywhere in the dial string. Default in U.S.

R Reverse mode

The R modifier changes the modem from originate mode to answer mode after the dialing process is complete. This modifier, used for compatibility with old originate-only modems, must be put at the end of the dial string.

S=n Dial phone number stored at location n

This subcommand dials the telephone number stored in location n, where n is 0, 1, or 2. This number has been previously saved using the AT&Z command.

W Dial tone detect

The W modifier makes the modem detect a dial tone before sending the next digit. If the tone has been detected by the modem before the S7 register time delay, the modem continues dialing the rest of the dial characters in the dial string. If no tone is received, the modem goes on-hook, returns the NO DIAL TONE result code to the host, and enters the local command state. This modifier can be embedded anywhere in the dial string, for example: ATDT9W5551234

: Calling card tone detect

Same as W. The colon modifier can detect most calling card tones and can be used to detect a wider range of frequencies.

@ Wait for quiet answer before dialing

For the time specified in the S7 register (default = 50 seconds), the modem attempts to detect 5 seconds of silence. This period of silence confirms that the call has been answered. If the 5 seconds of silence is detected, the modem dials the remaining numbers in the command line. The remaining numbers might be a security code, another telephone number, or an extension.

This modifier can be embedded anywhere in the dial string and can be used to access a system that requires entering additional dial characters after answering the initial call (for example, an answering machine).

Note that rings are detected reliably only when calling locally (that is, within the same country). If the ringing tone does not stop, the modem returns the NO ANSWER result code.

! Flash

This modifier causes the modem to go on-hook for a very short time and then back off-hook, as if the switch-hook button on the telephone set had been

pressed. This modifier can be placed anywhere in the dial string.

; Return to local command state after dialing
- ----------

This modifier forces the modem back to the local command state after dialing a number, allowing the modem to be used as a dialer (and the user must pick up the telephone handset at the end of the dial command) or to dial numbers in two or more steps. The semicolon (;) modifier must be put at the end of the dialing command.

En Echo off / on
-- -------------

This command controls the echoing of characters sent to the modem from the host back to the host when the modem is in command state.

E0 Disables the echo of characters sent by the host.
E1 Echoes characters sent by the host. Default

Fn Data echo to terminal
-- ----------

This command has no effect and remains for compatibility. F1 returns OK; all other values return ERROR.

Hn Off / on hook
-- -------------

When the modem is in on-line state, this command must be preceded by the +++ escape sequence.

H0 Forces the modem on-hook. If the modem is connected to the telephone line, the connection is dropped. Default.
H1 Forces the modem off-hook.

In Checksum, product information
-- ----------

I0 Requests the modem to return its product ID code. Default.
I1 Reserved for Apple Computer, Inc.
I2 Returns OK.
I3 Requests the country code of the DAA. In verbose mode, the name of the country is returned; in terse mode, only the code is returned. The following is a list of the country codes thus far defined:

E1	Sweden
E2	Switzerland
E3	United Kingdom
E4	United States
E5	Finland
F1	Australia
F2	Austria
F3	Belgium
F4	Canada
F5	Denmark
F6	France

F7 Germany
F8 Holland
F9 Ireland
FA Italy
FB Japan
FC Luxembourg
FD Norway
FE Spain

NO DAA DAA code does not correspond to a known country
Last country code / NO DAA: If no DAA is presently attached to the modem, it returns also the last country code ever attached (if any).

I4 Lists features of the modem.
I9 Returns the Apple Computer, Inc. product code and version information, as stored in the Express Modem file 'VERS' resource.

Ln Speaker volume
--

This command has no effect in the Express Modem, as the speaker is a component of the Macintosh computer and controlled by the user in the Sound control panel. The command remains for compatibility. L0-3 return OK; all other values return ERROR.

Mn Speaker on / off / auto
--

M0 Disables the speaker.
M1 Turns on the speaker until the carrier is established or until disconnection. Default
M2 Leaves the speaker on throughout the entire connection.
M3 Turns on the speaker until the carrier is established, except during dialing.

Nn Communication protocol preference
--

This command setting takes precedence over the ATB0 or ATB1 commands and over register S37. If either ATN1 or (ATN0 and S37 = 0) have been selected, the modem automatically determines Bell or CCITT mode or V.23 modulation.

Note ATB2 takes precedence over any settings of ATN or register S37. If ATB2 is selected, the modem attempts to connect at V.23 modulation, disregarding settings of ATN and S37.

N0 Uses register S37 for speed selection. If S37 = 0, uses automode, connecting at the highest possible speed and falling back as necessary, automatically determining Bell or CCITT mode, ignoring ATB0 or ATB1 settings. If S37 ≠ 0, uses only the speed specified in S37, regarding ATB0 or ATB1 setting to determine between CCITT and Bell modes. Default.
N1 Automode. Connects at the highest possible speed, falling back as necessary, automatically determining Bell or CCITT mode. Ignores ATB0 or ATB1 settings. If ATN = 1 and S37 ≠ 0, the value of S37

determines the maximum connection speed. This command is identical to setting N0 and S37 = 0.

N2 Identical to N1.

On Return to on-line state

This command brings the modem to on-line state from command state and returns ERROR if the modem is not connected to the telephone line.

O0 Returns to the on-line state after having entered command state from the escape sequence.

O1 As above but triggers retrain before reentering on-line state.

P Enable pulse dialing

Sets the default dialing mode to pulse mode. This command can also be used as a subcommand of the D command.

Qn Quiet / verbose mode

Q0 Sends result codes to the host. Default.

Q1 Disables sending result codes to the host.

Q2 Returns result codes in originate mode and not in answer mode.

Sn Select an S register

This command selects the default S register to be used in subsequent commands when no S register number is given.

Sn? Read an S register

The Sn? command is used to read the contents of a register (n = register number). The response is always expressed as a three-digit decimal number, where the leading digits or all digits may be zero. OK is returned after the display of the register contents.

Sn=m Write to an S register

This command places the value m into the register n. See the section “S Registers” for specifics of the registers and their values.

T Enable tone (DTMF) dialing

Sets the default dialing mode to Touch-Tone mode. Can be used in the dial string. Default.

Vn Numeric / verbose result codes

V0 The modem sends the result code in numeric form without line feed characters.

V1 The modem sends the result code in verbal (English) form with line

feed characters. Default.

Supported result codes are as follows:

Verbose	Terse	Meaning
OK	0	Command completed
CONNECT	1	Connection established
RING	2	Incoming ring detected
NO CARRIER	3	No connection or lost the carrier
ERROR	4	Bad command
CONNECT 1200	5	Connection established at 1200 bps
NO DIALTONE	6	Dial tone not detected in S7 seconds
BUSY	7	Busy tone detected
NO ANSWER	8	See ATD with the @ dial modifier
CONNECT 2400	10	Connection established at 2400 bps
CONNECT 4800	11	Connection established at 4800 bps
CONNECT 9600	12	Connection established at 9600 bps
CONNECT 14400	13	Connection established at 14400 bps
CONNECT 7200	15	Connection established at 7200 bps
CONNECT 12000	16	Connection established at 12000 bps
CONNECT 1200/75	22	Connection V.23 transmitting 1200 bps
CONNECT 75/1200	23	Connection V.23 transmitting 75 bps
CONNECT 300/REL	24	Connection with MNP 300 bps
CONNECT 1200/REL	25	Connection with MNP 1200 bps
CONNECT 2400/REL	26	Connection with MNP 2400 bps
CONNECT 4800/REL	27	Connection with MNP 4800 bps
CONNECT 9600/REL	28	Connection with MNP 9600 bps
CONNECT 7200/REL	29	Connection with MNP 7200 bps
CONNECT 12000/REL	30	Connection with MNP 12000 bps
CONNECT 14400/REL	31	Connection with MNP 14400 bps
CARRIER 300	40	Carrier detected at 300 bps
CARRIER 1200/75	44	Carrier detected at 1200 bps sending; 75 bps receiving
CARRIER 75/1200	45	Carrier detected at 75 bps sending; 1200 bps receiving
CARRIER 1200	46	Carrier detected at 1200 bps
CARRIER 2400	47	Carrier detected at 2400 bps
CARRIER 4800	48	Carrier detected at 4800 bps
CARRIER 7200	49	Carrier detected at 7200 bps
CARRIER 9600	50	Carrier detected at 9600 bps
CARRIER 12000	51	Carrier detected at 12000 bps
CARRIER 14400	52	Carrier detected at 14400 bps
COMPRESSION: CLASS 5	66	MNP class 5
COMPRESSION: V.42BIS	67	V.42 bis compression
COMPRESSION: NONE	69	No compression
PROTOCOL: NONE	70	Asynchronous mode
PROTOCOL: LAP-M	77	Error control mode with LAP-M protocol
PROTOCOL: LAP-M/HDX	78	LAP-M protocol Half duplex
PROTOCOL: ALT	80	Error control mode with MNP protocol
MODEM IN USE	128	Modem already in use for this or another association

DIALING DISABLED	129	Blacklisting table is full
BLACKLISTED NUMBER	130	Modem momentarily refuses to dial this number
LINE CURRENT DETECTED	131	
NO LINE CURRENT	132	
UNKNOWN COUNTRY CODE	133	Unknown DAA Country Code
FORBIDDEN NUMBER	134	Number dialed is forbidden

Codes 129 and 130 appear only in those countries where the “blacklisting” of unsuccessful telephone numbers is mandatory. The number of telephone numbers in the list will be set according to regulations in each country.

Wn Progress result codes

The ATW setting determines whether progress result codes will be displayed in addition to the ATX codes. Register S95 determines which progress result codes will be displayed.

- W0 Disables progress codes 40 through 80.
- W1 Enables progress codes 40 through 80. Default.
- W2 Disables progress codes 40 through 80; identical to W0.

When writing a CCL script, pay attention to result codes for scripts that require a specific response. If progress codes are enabled, the following strings appear on the screen during a connection (in this example, a V.22 bis connection with no error control):

```
CARRIER 2400
PROTOCOL:NONE
CONNECT 2400
```

As the modem is a bus modem and the modem-to-DTE interface is software based, only modem-to-modem speeds are returned.

Xn Activate result codes

The result codes listed in Vn are divided into subsets that can be selected by the X command.

- X0 Activates result codes [0..4, 8, 128..134].
- X1 Activates result codes [0..5, 8..134].
- X2 Activates result codes [0..6, 8..134].
- X3 Activates result codes [0..5, 7..134].
- X4 Activates result codes [0..134]. Default

Dial tone detection is enabled and disabled by X2 and X4. Busy tone detection is enabled and disabled by X3 and X4.

X0, X1, and X3 set the autodialer in “blind dialing” mode (that is, no dial tone is expected after going off-hook) in those countries where blind dialing is allowed. If X0 is set, the CONNECT result code means that a connection was established whatever the speed is. However, if X1 to X4 are set, CONNECT means that a connection was established at either 110 or 300 bps only. See

the MNP-specific modifier applicable to codes 24-28.

Yn Break handling
-- --------------
This command controls the behavior of the modem on reception of a long-space (break) signal from the remote modem of longer than 1.6 seconds for an asynchronous connection or an attention frame for MNP or V.42 connections.

- Y0 Disables long-space handling. The long-space is ignored. Default.
- Y1 Enables long-space handling. If the modem receives a long-space, it replies with a break of 4 seconds, disconnects (goes on-hook), and returns to command state.
- Y2 Enables long-space handling. If the modem receives a break when it is in data mode, it replies with a break of 4 seconds and returns to command state, remaining connected to the remote modem.

Zn Reset
-- -----
The Z command tells the modem to perform a software reset. After reset, the optional parameter profile specified in the command argument is restored.
- Z0 Loads saved profile 0 into the active profile. Default
- Z1 Loads saved profile 1 into the active profile.

&Cn DCD options
--- -----------
This command has no effect and remains for compatibility. Values 0, 1, and 2 return OK; all other values return ERROR.

&Dn DTR options
--- -----------
Since internal, or bus, modems do not have a DTR line, this command should determine modem response when the user closes the connection or the application currently using the modem (that is, when the modem is off-hook). In this situation, the Express Modem drops the connection and hangs up. Therefore, AT&D has no effect and remains for compatibility. Values 0 through 3 return OK; all other values return ERROR. Default = 3

&F Recall factory profile
-- ----------------------
This command restores the factory configuration as the active profile.

&Gn Guard tones
--- -----------
This command specifies whether guard tones should be transmitted and, if so, at what frequency. Some telephone systems use guard tones to allow proper data transfer over the network. Guard tones are not used in the United States. The modem does not recognize the value of 1 (550Hz guard tone) and returns ERROR.

- &G0 Disables guard tone (default in the United States).
- &G1 Sends 1800 Hz guard tone (default outside of the United States).
- &G2 Same as &G1.

&Kn Local flow control

--- ---

This command specifies which kind of local flow control is used between the communications application and the Express Modem software. Since flow control mechanisms are built in, this command has no effect and remains for scripting compatibility. Flow control characters generated by the communications application are always passed to the line. See the section “Flow Control” in this chapter. The &K command setting will not be stored or displayed in the profile. &K0–&K5 respond OK, and no action is taken. Other values generate ERROR.

&Ln Switched / leased line

--- ---

This command affects the modem’s behavior during the call-setup and the carrier-handshake phases at the beginning of a connection.

&L0	Selects switched (dial-up) line. All timeouts are active according to the definition of the handshake protocols. Default.
&L1	Selects leased line. All timeouts are ignored during the handshake process. Calling and answer tones are not exchanged while executing D and A command (that is, the carrier handshake is started immediately).

&Mn Asynchronous / synchronous operation

--- ---

This command has no effect and remains for compatibility. &M0 returns OK; all other values return ERROR. See also &Q.

&Pn Pulse mode make / break ratio

--- ---

&P0	Make = 39%, break = 61% Default
&P1	Make = 33%, break = 67%

Note: Pulse mode specifications vary from country to country, as set by national regulatory bodies, and are not available for change. Correct settings for each country are made automatically by the Express Modem firmware.

&Qn Connection mode

--- ---

The &Q command setting has precedence over the \N command setting and registers S36 and S48.

&Q0	Asynchronous mode (no error control, disables V.42 and MNP). Returns OK.
&Q1–4	Synchronous mode (data transparent synchronous mode). Returns ERROR.
&Q5	Error-control mode (enables V.42 and MNP); coupled with the register values set in S36 and S48. Returns OK. Default.
&Q6	Same as Q0. Returns OK.

&Rn CTS / RTS

--- ---

This command has no effect and remains for compatibility. &R0 and &R1 return OK; all other values return ERROR.

&Sn DSR

This command has no effect and remains for compatibility. Values0, 1, and 2 return OK; all other values return ERROR.

&Tn Self-Tests

The following diagnostic tests are available only when no error protocol is engaged. The duration of each test is controlled by register S18.

- &T0 Terminate the self-test; terminates (escapes) a test in progress and returns the modem to command state, if S18 = 0.
- &T1 Local analog loopback; initiates a local analog loopback test. The escape sequence must be entered to terminate this test. This mode tests the Express Modem and the host Macintosh computer. The modem responds with the CONNECT message when the loopback connection has been established.
- &T3 Local digital loopback; initiates a local digital loopback test. The Express Modem echoes characters back to the remote modem exactly as received.
- &T4 Enable remote digital loopback; enables the Express Modem to respond to a remote modem that is attempting to place it in a digital loopback test. If the remote modem places the Express Modem in remote digital loopback mode, the Express Modem echoes characters back to the remote modem exactly as received.
- &T5 Disable remote digital loopback; disables the Express Modem from responding to a remote modem that is attempting to place it in the digital loopback mode.
- &T6 Initiates remote digital loopback; tests both the Express Modem and the remote modem as well as the telephone circuits. Characters sent to the remote modem are echoed back to the Express Modem exactly as they were received.
- &T7 Remote digital loopback with self-test; initiates a remote digital loopback (like &T6) with self-test data pattern generation and error checking.
- &T8 Local analog loopback with self-test; initiates a local analog loopback (like &T1) with self-test data pattern generation and error checking. The modem responds with the CONNECT message when the loopback connection has been established. The tests terminate when the host issues an AT&T0 command or the register S18 time delay expires. The self-test data pattern is an internally generated $511 sequence. In the self-test modes, an error counter counts the number of errors and sends the final result to the host at the end of the test. The maximum number of errors that can be counted is 255.

Note: &T1 takes an optional, single-character parameter to indicate whether the analog loopback must be done in originate mode (O or o, the default) or answer mode (A or a).

&Un Trellis coding

This command enables and disables Trellis code modulation in V.32.

  &U0   Enable Trellis coding. Default.
  &U1   Disables Trellis coding.

&V   Display profiles
--   ----------------
This command displays the active profile, stored profile 0, stored profile 1, and stored telephone numbers (see AT&Z). The MNP settings are not displayed by this command.

&Wn   Profile saving
---   --------------
This command saves the current active profile.

  &W0   Saves the active profile into profile 0.
  &W1   Saves the active profile into profile 1.

&Xn   Synchronous clock source
---   ------------------------
This command, included for compatibility, is ignored and not saved in any profile. It always returns OK.

&Yn   Start-up profile
---   ----------------
This command sets the profile to be used at start up.

  &Y0   Specifies profile 0 as the start-up configuration. Default.
  &Y1   Specifies profile 1 as the start-up configuration.

&Zn=s   Store telephone number
-----   ----------------------
This command stores the dial string s (a maximum of 64 characters) in location n (equal to 0, 1, or 2). Note that the dial string s is constructed in the same fashion as for the ATD command: it must be the last command on the command line and have no other characters following the dial string. The dial string is not validated before being saved.

System 7.x: Can't Start with Install 1 Floppy Disk Copy (7/93)

Revised: 7/12/93
Security: Everyone

System 7.x: Can't Start with Install 1 Floppy Disk Copy (7/93)

==========

Article Created: 25 March 1993

Article Change History

07/09/93 - REVISED
- To add more history and technical explanation.

TOPIC ----------

I'm trying to make working copies of System 7.1 disks via the disk-to-disk copy method. After copying the Install 1 disk, I attempted to start up from the disk. The "Welcome to Macintosh" message appeared, a vibrating blank dialog box appeared, and then my system froze. Why did this happen using the traditional disk copy method? (When I used Disk Copy to make a backup copy, there was no problem.)

DISCUSSION ----------

This anomaly has been around since System 7.0 was introduced. It isn't a bug. There isn't enough room on a floppy disk to fit the Installer, a Finder, and a System file. A decision was made to put a System and Installer on the Install 1 disk and have the disk start up directly into the Installer application. To do this, the boot blocks on the floppy disk were written to have the Installer (not The Finder) as the startup application.

Prior to System 7, the Macintosh was capable of starting up to any application by using the Set Startup feature of the Finder (not Multi-Finder). The Set Startup feature actually wrote the application's name to the startup volume's boot blocks. Since System 7 is a multitasking operating system and no longer supports a single tasking environment, it always assumes that the Finder is the startup application. The Set Startup feature was removed from the System 7 Finder.

The problem of not being able to boot from a copy of Install 1 or

InstallMeFirst occurs because of what happens when you copy these disks to another disk using the Finder. When you copy a System file to another disk, the standard boot blocks are written with the Finder as the Startup application. This means that when a Macintosh tries to boot from the new disk, it will be trying to launch a file called Finder. Of course, there's no Finder on the Install 1 or InstallMeFirst disk, and the Macintosh will hang up.

Since the boot blocks contain the name of the Finder as the startup application, you can rename the Installer to Finder. When a Macintosh boots up from the copy of Install 1 or InstallMeFirst disks, the Macintosh will launch the renamed Installer application and the install will proceed as normal. However, Apple doesn't recommend or support this solution. The supported and recommended solution is to use a sector copy program such as Disk Copy.

A/UX 3.0: setfile Command Problem (3/93)

Revised: 3/11/93
Security: Everyone

A/UX 3.0: setfile Command Problem (3/93)

==========

Article Created: 9 March 1993

TOPIC ----------

I am running A/UX 3.0 and would like to know how to stop A/UX changing the file creator and type of a file that I have modified with vi. I would also like to know how to modify the file type and file creator -- I have tried using the A/UX setfile command, and get messages such as "can't unlock <filename>" or "can't change file info". When I try SetFile in MPW, it tells me these files are locked, and that I don't have sufficient privileges to change them.

DISCUSSION ----------

We have seen this with the setfile command under A/UX 3.0. There is a problem with the setfile command handling error messages and with the working of the command options. For example, the "setfile -aL junk" command, complains with "setfile: Can't lock junk", but if you use ResEdit and Get File Folder Info, you'll see the File Locked box is checked! Then if you do "setfile -al junk" (try to unlock the file), it also complains with "setfile: Can't unlock junk", but it DOES unlock the file after viewing with ResEdit.

We have checked for reported bugs, and there was a problem report on the setfile command stating that it doesn't set type or creator on some Apple Single Files, the "setfile ... command complained ...: Error 0", but it DOES set the file type and creator! This bug still exists in A/UX 3.0.

As a workaround until the setfile bug is fixed, use ResEdit instead of the setfile command to set file attributes .

Macintosh Family: Batteries & Part Numbers (2/97)

Revised: 3/19/97
Security: Everyone

Macintosh Family: Batteries & Part Numbers (2/97)

==========

Article Created: 11 March 1993
Article Reviewed/Updated: 20 February 1997

TOPIC -----

(1) Why do Macintosh computers have an internal battery?

(2) How long does this battery usually last?

(3) The battery in my Macintosh has a date stamped on it. Is this the manufacture or expiration date?

(4) What are the symptoms of a dead battery?

(5) How do I replace the battery when it goes dead?

(6) What kind of battery is the internal battery?

(7) What are the part numbers for the batteries in various Macintosh models?

DISCUSSION -----

(1) Why do Macintosh computers have an internal battery?

Macintosh computers contain a battery in order to maintain certain internal settings even when the computer is turned off. These settings include things such as the date & time, the AppleTalk on/off setting, and the color on/off setting. These settings are stored in a special part of memory called PRAM (parameter RAM).

(2) How long does this battery usually last?

We believe that a battery should last UP TO five years after you receive your Macintosh. This does NOT mean that we expect every battery to last this long.

Note that the battery may fail sooner, depending upon its shelf life, power usage patterns, and the individual battery inside your computer.

(3) The battery in my Macintosh has a date stamped on it. Is this the manufacture or expiration date?

It is the manufacture date.

(4) What are the symptoms of a dead battery?

When the Macintosh will not retain PRAM settings (such as the date/time) after it has been turned off, this generally indicates a dead battery.

(5) How do I replace the battery when it goes dead?

Apple recommends dealer installation of a new battery. Apple does not sell service parts such as batteries directly to end users. A battery can explode if installed in the wrong position. Finally, Apple-authorized service providers will return dead batteries to Apple for safe disposal or recycling.

(6) What kind of battery is the internal battery?

It depends on the model of Macintosh. The batteries used in Macintosh computers are lithium or alkaline, and are commonly 3.6-4.5 volts.

(7) What are the part numbers for the batteries in various Macintosh models?

Begin_Table

Macintosh Model	Battery Part Number
Macintosh 128, 512K, 512Ke, Macintosh Plus	742-0003
equivalents: Eveready #523-BP Ray-O-Vac #RPX-21 Duracell #PX-21 Panasonic #PX-21	
Macintosh SE 800K, Macintosh II (with leads)	742-0009
Macintosh II with 600-0530 Battery Holder Board	742-0011
Macintosh SE FDHD (with leads)	742-0011
Macintosh Classic (4-chip and 2-chip)	742-0011
Macintosh SE/30, IIx, IIcx, IIci, IIfx, IIsi	742-0011
Macintosh IIvi, IIvx, Performa 600	742-0011
Macintosh LC, LC II, LC III, Performa 400 series	742-0011
Macintosh Quadra 605, LC 475, Performa 475, 476	742-0011
Macintosh LC 520, LC 550, Performa 550	742-0011*
Macintosh LC 575, Performa 575, 577, 578	922-0750

Macintosh Classic II, Color Classic, Performa 200	742-0011*
Macintosh 630 Family including Quadra, LC, Performa	922-0750
Macintosh Centris 610, 650, 660AV	742-0011
Macintosh Quadra 610, 660AV, 650, 700, 800, 840AV, 900, 950	742-0011
Power Macintosh and Performa 5200, 5300, 6200, 6300 5400, and 6400 series computers	922-0750
Power Macintosh 6100/60, 6100/66, 7100/66, 8100/80	742-0011
Power Macintosh 7100/80, 8100/100, 8100/110, 7200 series, 7500 series, 7600 series, 8500 series, and 9500 series	922-1262

* Logic boards of the Color Classic, Macintosh LC 520, and the LC/Performa 550 have been revised and use a new battery, part number 922-0750. Your service provider will be able to determine which battery should be used.

Portable and PowerBook computers

For the system batteries listed below, readings of less than 5.4 Volts indicate sulfated (irreparably damaged) batteries for the Portable and PowerBook 100 batteries.

The Nickel Cadmium Batteries in the PowerBook 140, 145, 160, 165c, 170 and 180 computers, the Nickel Metal Hydride batteries in the PowerBook Duo, 500, 190, 5300 and 1400 computers and the Lithium Ion batteries in the PowerBook 3400 can usually be recharged even from a deep discharge.

Portable/PowerBook Model	Battery Part Number
Portable, Backlit Portable System Battery	076-0376
Portable, Backlit Portable Backup Battery	9 Volt Alkaline
PowerBook 100 System Battery	661-0782
PowerBook 100 Backup Batteries	CR-2430 (qty 3)
PowerBook 140, 145, 170 System Battery	661-0754
PowerBook 140, 145, 170 Backup Battery	661-0724 (attached to board)
PowerBook 150 System Battery	661-0013
PowerBook 150 Backup Battery	661-0190 (attached to interconnect board)
PowerBook 160, 180 System Battery	661-0789
PowerBook 160, 180 Backup Battery	661-0750 (attached to board)
PowerBook 165c System Battery	661-0013
PowerBook 165c Backup Battery	661-0764 (attached to board)
PowerBook 180c System Battery	661-0013

PowerBook 180c Backup Battery	661-0685 (attached to interconnect board)
PowerBook 190 series* System Battery	661-1028
PowerBook 190 series Backup Battery	922-1418
PowerBook Duo 200 series* System Battery	661-0053
PowerBook Duo 200 series Backup Battery	630-6546
PowerBook 500 series* System Battery	661-0055
PowerBook 500 series Backup Battery	922-0786
PowerBook 1400 series* System Battery	922-2420
PowerBook 1400 series Backup Battery	922-2429
PowerBook Duo 2000 series* System Battery	661-0053
PowerBook Duo 2000 series Backup Battery	630-6546
PowerBook 3400 series* System Battery	922-2471
PowerBook 3400 series Backup Battery	922-2692
PowerBook 5300 series* System Battery	661-1028
PowerBook 5300 series Backup Battery	922-1418

End_Table

* PowerBook Series

PowerBook 190 series includes the following models: PowerBook 190 and 190cs.

PowerBook (Duo) 200 series includes the following models: PowerBook Duo 210, 230, 250, 270c, 280, and 280c.

PowerBook 500 series includes the following models: PowerBook 520, 520c, 540, 540c, and 550 (550 sold in Japan only).

PowerBook 1400 series includes the following models: PowerBook 1400c and 1400cs.

PowerBook 2000 series includes the following model: PowerBook 2300c.

PowerBook 3400 series includes the following model: PowerBook 3400c.

PowerBook 5300 series includes the following models: PowerBook 5300, 5300c, 5300ce, and 5300cs.

Article Change History:
20 Feb 1997 - Added new PowerBook model and PowerBook series descriptions.
12 Nov 1996 - Corrected 660AV name.
30 Oct 1996 - Added 660AV and 840AV.

SNA•ps 5250: Product Description and Features(Discontinued)

Revised: 6/2/94
Security: Everyone

SNA•ps 5250: Product Description and Features(Discontinued)

==========

Article Created: 9 March 1993

TOPIC ----------

This article describes the Apple SNA•ps 5250 product and its features and benefits.

DISCUSSION ----------

SNA•ps 5250 (Systems Network Architecture protocols and services) is a full-function 5250 display terminal emulation program that allows Apple Macintosh personal computers to communicate with IBM AS/400 systems. This application provides multiple session windows that can be individually configured with different color settings, font sizes, connection paths, and host languages.

The SNA•ps 5250 application software works with the Apple Token Ring 4/16 NB Card or Apple Serial NB Card installed in any Macintosh II or Macintosh Quadra (NuBus capable) computer and supports directly connected or AppleTalk distributed 5250 sessions.

In an AppleTalk network with an SNA•ps Gateway installed, SNA•ps 5250 users can access AS/400 services from any Macintosh from the Macintosh Plus and later systems. In addition, users can access multiple gateways for concurrent access to multiple AS/400 systems.

SNA•ps 5250 also supports standard Macintosh copy and paste techniques, enabling users to smoothly integrate AS/400 data into their Macintosh applications. Access to AS/400 databases and files are provided by Apple's Data Access Language (DAL) Server for AS/400. These facilities allow you to query data easily from the AS/400 system and place it in a local application on the Macintosh desktop.

The SNA•ps Print application software is included with SNA•ps 5250. SNA•ps

Print allows a Macintosh computer to receive print data from an IBM AS/400 system and print the data on any printer in the AppleTalk network.

Features and Benefits

- 5250 terminal emulation allows Macintosh users to access 5250-based applications.

- Extended attribute support provides display support for base and extended attributes and status line symbols.

- On-line help provides assistance in configuring and running SNA•ps 5250.

- Keyboard remapping allows users to create any layout of 5250 control keys on the attached Macintosh keyboard.

- Configurable on-screen keypads eliminates the need for the user to memorize the keyboard map.

- Keystroke record, playback, and editing allows definition of a string of frequently used keystrokes for automated host access.

- 5250 sessions distributed over AppleTalk allows SNA access for any Macintosh system connected to an AppleTalk network.

- Multiple language support lets you choose the language for each session, to match your host environment.

- AS/400 printer emulation, SNA•ps Print, allows a user's Macintosh to retrieve and print AS/400 data.

- Configurable clipboard formats allow users to create special copy formats for copying AS/400 data into other Macintosh applications.

- "Hot spots" enable users to send 5250 function keys by double-clicking in the SNA•ps 5250 window.

SNA•ps 5250 and IBM Client Series Q&A (2/93)

Revised: 6/21/93
Security: Everyone

SNA•ps 5250 and IBM Client Series Q&A (2/93)

==========

Article Created: 15 February 1993

Article Change History

06/21/93 - REVISED
- To remove press inquiry contact.

TOPIC ----------

This article answers questions about the SNA•ps 5250 and IBM Client Series announcements.

DISCUSSION ----------

Q: What is SNA•ps 5250?
A: SNA•ps 5250 is software that provides Macintosh computer users with emulation of IBM's 5250 family of terminals and printers. With SNA•ps 5250, any Macintosh personal computer, from the PowerBook to the Macintosh Quadra, can access the extensive suite of applications available on IBM's AS/400 systems.

Q: What will come in the box with the SNA•ps 5250 product?
A: SNA•ps 5250 contains a personal APPC only gateway, 5250 terminal emulation software, and 3812 print emulation software enabling stand-alone access to an AS/400 when used with an Apple Token Ring NB card or Serial NB card.

Q: What is SNA•ps 5250 GC?
A: SNA•ps 5250 GC is software that provides Macintosh computer users with networked solutions for emulation of IBM's 5250 family of terminals and printers. SNA•ps 5250 GC contains a 5250 terminal emulation software, and 3812 print emulation software. When used in conjunction with a SNA•ps Gateway, and an Apple Token Ring 4/16 NB card or Apple Serial NB

card, SNA•ps 5250 GC enables networked Macintosh users via LocalTalk, EtherTalk, or TokenTalk access to an AS/400.

Q: Is IBM actually selling an Apple product?
A: Yes. The SNA•ps 5250 application software will be sold by IBM as part of the AS/400 Client Series, which specifies IBM and end-user products and application development tools designed for client/server computing. The SNA•ps 5250 product is scheduled to be included in the Client Series starting June 25, 1993.

Q: How can I order SNA•ps 5250 software from Apple?
A: SNA•ps 5250 may be ordered beginning in June 1993 through Apple authorized resellers. Pricing and availability outside the United States will vary by country. For more information, call Apple's Network Information Line at 408-862-3385 between the hours of 8AM and 5PM, Monday through Friday, Pacific Time.

Q: What does IBM's version of SNA•ps 5250 cost? How can I order SNA•ps 5250 from IBM?
A: For more information or to place orders, contact an IBM marketing representative or call 1-800-IBM-CALL.

Q: Why is IBM selling this product as part of the Client Series?
A: The goal of the Client Series is to provide AS/400 customers with products that provide personal computers users with applications and tools that allow them to effectively integrate their desktop device of choice with the AS/400 environment. Since both the Macintosh and the AS/400 are leaders in ease of use for the personal computer and midrange categories, it was natural to include support for the Macintosh in a program that is designed to deliver ready to use solutions to customers.

Q: Will Apple be selling SNA•ps 5250?
A: Yes. Apple will be selling SNA•ps 5250 through all existing channels worldwide when it begins shipping in June 1993. For more information, call the Network Information Line at 408-862-3385. Pricing and availability outside the United States will vary by country.

Q: Will SNA•ps 5250 be available from IBM worldwide?
A: No. At this time, Apple's participation in IBM's Client Series is limited to the U.S. and Canada.

Q: How will the product be supported? Should I call IBM if I have a problem or should I call Apple?
A: Customers who buy SNA•ps 5250 from IBM through the Client Series will receive support on the product directly from IBM. Technical problems that can't be addressed by the IBM Support Organization will be escalated to the Apple Engineering Support Organization.

Q: What are the key features of the product?
A: This product allows Macintosh computers equipped with either an Apple Token Ring 4/16 NB card or Apple Serial NB card to connect to any AS/400 and emulate IBM's 5250 terminal and printer family. The product supports both Token Ring and SDLC attachments to the SNA network, and

LocalTalk, Ethernet, and Token Ring connections to AppleTalk networks when running as a client to an SNA•ps Gateway. It supports IBM 5250 screen display formats, as well as keyboard remapping and keystroke recording to enhance its ease of use. SNA•ps 5250 also supports standard Macintosh copy–and–paste techniques, enabling users to smoothly integrate AS/400 data into their Macintosh applications. In addition, SNA•ps 5250 includes SNA•ps Print application software, allowing Macintosh users to print directly from the AS/400 to any locally attached or networked printer.

Q: What is the SNA•ps product family?
A: Apple's SNA•ps family is a set of software products that provide protocols and services for Macintosh users who need access to data and applications in IBM's SNA environments. The SNA•ps products offer concurrent support for terminal emulation, host based printing and peer–to–peer communication in SNA networks from a single Macintosh computer or an AppleTalk network gateway. The SNA•ps product line consists of three products: SNA•ps Gateway, SNA•ps 3270 and SNA•ps 5250 as well as programming kits for custom application development.

Q: There are existing third-party products in this market. Why has Apple elected to do this product?
A: Apple elected to develop SNA•ps 5250 for the best reason possible: our customers asked us to do it. As part of our efforts to identify what products should be developed under the Enterprise Networking Initiative (part of the alliance between Apple and IBM), both companies talked with a wide range of customers. At the top of the lists of both IBM and Apple customers was better integration between Macintosh and the IBM AS/400 midrange system. To this end, we have provided the Data Access Language Server for AS/400, and are now introducing the SNA•ps 5250 product. It is our intention to develop additional products that further the integration of the Macintosh and AS/400.

Q: Can I use it in conjunction with my existing SNA•ps Gateway? Can I use SNA•ps 5250 concurrently with SNA•ps 3270?
A: Yes. The number of sessions is limited only by the Gateway configuration and amount of memory available on the user's Macintosh to run 5250 and 3270 sessions.

Q: I am currently using SNA•ps 3287 to print to my LaserWriters. Can I upgrade to SNA•ps Print? How much does it cost? How can I get it?
A: Yes. Upgrades from SNA•ps 3287 to SNA•ps Print software will be available in June. There will be no charge for the upgrade. For additional information, contact Apple's Network Information Line at 408-862-3385.

Q: Will IBM be selling other Apple products, such as computer systems?
A: At this time, only SNA•ps 5250 will be part of the Client Series. It is the intention of both companies to add other Apple software products to the program as soon as possible. These products will allow networked Macintosh computers access to applications running on the AS/400 as well providing easy access to all of the data resident on the AS/400. While any additional products will be considered for inclusion in the Client

Series, there are no plans to include Apple hardware in the Client Series.

Q: Does Apple provide other IBM AS/400 connectivity products?
A: Yes. Apple currently offers the Data Access Language Server for AS/400, and the SNA•ps Gateway product. Data Access Language for the AS/400, which began shipping in December '92, provides easy access to relational data residing on the AS/400. The SNA•ps Gateway, available since June 1991, provides SNA services to Macintoshes on AppleTalk networks. It currently supports 3270 and APPC services, and with the shipment of SNA•ps 5250 in June will also provide support for 5250 services. These products are available through Apple's existing channels. For additional information on either product, contact Apple's Network Information Line at 408-862-3385.

Q: How does SNA•ps work with the Data Access Language Server for AS/400?
A: The SNA•ps Gateway or SNA•ps 5250 packages provide APPC connections for Apple's Data Access Language Server for AS/400, which allows Macintosh computers to transparently access relational databases and files on AS/400 systems. Data Access Language is a SQL connectivity language which provides users with a consistent interface from the desktop to the information residing on a variety of servers and host computers, including IBM, Digital, UNIX and other computers. With this consistent interface, Macintosh users can easily integrate information from the server or host computer into off-the-shelf applications for further analysis, manipulation and reporting.

SNA•ps 5250: Requirements, Related Products, Ordering (3/95)

Revised: 3/29/95
Security: Everyone

SNA•ps 5250: Requirements, Related Products, Ordering (3/95)

==========

Article Created: 9 March 1993
Article Reviewed/Updated: 29 March 1995

TOPIC ----------

This article describes the SNA•ps 5250 system requirements, related products, product support, and ordering information.

DISCUSSION ----------

To use SNA•ps 5250, you need

• A Macintosh II or Macintosh Quadra computer (NuBus capable)

• An Apple Token Ring 4/16 NB Card or Apple Serial NB Card

• Macintosh system software version 7.0 or later

To use SNA•ps 5250 as a client to an SNA•ps Gateway, you need
---
• SNA•ps 5250 or SNA•ps 5250 GC

• A Macintosh Plus or later Macintosh system as the client computer

• A Macintosh II or Macintosh Quadra computer running the SNA•ps Gateway software on your AppleTalk network

• Macintosh system software version 7.0 or later

To perform SQL data access on the AS/400

Through SNA•ps APPC sessions, you must have the following software:

• Data Access Language (DAL) Server for AS/400 software (either a 1/4-inch cartridge tape or a 1600 bpi 9-track tape) that provides Macintosh client access to AS/400 databases.

• Data Access Language Client version 1.3.7 software, systems software for the Macintosh computer that provides access to host data for local applications.

Ordering Information

To order the SNA•ps product famile contact Wall Data. To order Data Access Language contact ITI (Independence Technologies, Inc. The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

Article Change History:
29 Mar 1995 - Corrected information on ordering.

PowerBook Fax/Data Modem: Turning Off Data Compression 3/93

Revised: 5/31/94
Security: Everyone

PowerBook Fax/Data Modem: Turning Off Data Compression 3/93

==========

Article Created: 10 March 1993

TOPIC ----------

I am having a problem using a PowerBook Fax/Data Modem and MacTerminal to connect to our VAX. In order to connect, I need to disable data compression on the modem. I can do this manually, by setting the "&Q" parameter to 1, but when I use the "PowerBook Modem Tool" it resets that parameter to 5, enabling data compression.

Is there a way to modify the modem initialization string for the "PowerBook Modem Tool"?

DISCUSSION ----------

One way is to use the Serial Tool to manually configure the modem and dial.

The other way is to use the Apple Modem Tool and select "Custom" modem configuration. This allows you to specify the exact AT commands required.

The tools mentioned are available on AppleLink. Here's the path:

```
Software Sampler
  Apple SW Updates
    Macintosh
      Networking & Communications
        Communication Toolbox Tools
```

A/UX: C Code Portability (3/93)

Revised: 3/16/93
Security: Everyone

A/UX: C Code Portability (3/93)

==========

Article Created: 10 March 1993

TOPIC ----------

I need to know the list of platforms supported for compiling code. The C code used for development will need to be ported to multiple platforms. I noticed that the /bin directory shows that the following are supported:

- VAX-11/750 and 780
- PDP 11/45 and 70
- 3B 20S
- 3B 2, 5 and 15
- 680x0

DISCUSSION ----------

The programs mentioned do NOT mean the compiled code developed under A/UX is executable or portable to other hardware platforms. They are programs that let you identify the CPU type (machine id) you are currently running or are compatible with. If the return value of the program is "0" it means your CPU type is the same as the program you are running. For example under A/UX "m68k" (for Motorola 68000) returns 0 (echo $?). All other CPUs will return 255.

To port to a DIFFERENT hardware platform, the C source code must be recompiled on the targeted platform. If the C code was said to be portable or meet a standard, the C code can be recompiled without any alteration under the targeted platform. A/UX 3.0 conforms with many standards, including:

- IEEE POSIX 1003
- FIP 151-1
- AT&T System V SVVS
- ANSI C compiler from A/UX Developer's Tools

AppleCD: Proper Placement of CD in Caddy 3/93

Revised: 4/21/93
Security: Everyone

AppleCD: Proper Placement of CD in Caddy 3/93

==========

Article Created: 16 March 1993

TOPIC ----------

Why is placement of the CD disc in the CD Caddy important?

DISCUSSION ----------

If the CD disc is not properly placed in the CD Caddy, the CD Caddy will bow and become stuck in the CD mechanism. After this occurs, the CD mechanism is unable to eject the CD Caddy and the CD mechanism must be replaced.

Once the CD Caddy is jammed inside the CD mechanism, the only recourse for its removal involves major disassembly of the entire drive mechanism. This removal cannot be done in the field and must be handled by a complete drive replacement.

When inserting a CD into the CD Caddy, make sure the CD is completely flush with the bottom of the CD Caddy. This assures the complete closure of the CD Caddy door and insures proper function of the CD mechanism.

Macintosh Quadra 650 and 800: Interleaved Memory (7/94)

Revised: 7/28/94
Security: Everyone

Macintosh Quadra 650 and 800: Interleaved Memory (7/94)

==========

Article Created: 5 March 1993
Article Reviewed/Updated: 28 July 1994

TOPIC ----------

The Macintosh Centris 650, and Quadra 800 computers feature a newly designed memory controller that supports interleaved memory. The following article explains how interleaved memory works on these computers and how to configure the computers for maximum performance.

The Quadra 650 can be used interchangably with the Centris 650 in this document.

DISCUSSION ----------

Note that as of this date, the Centris 650 and Quadra 800 are the only Macintosh models that support memory interleaving. Neither the Centris 66AV nor the Quadra 840AV support memory interleaving.

Interleaved Memory on the Centris 650 and Quadra 800

The main memory subsystem of the Macintosh Centris 650 and Quadra 800 computers makes use of a memory access technique called interleaved memory. This memory organization serves to reduce the overall access time of the 68040 processor into DRAM. The following description illustrates how this memory organization works and why it results in reduced memory access time.

Non-Interleaved Memory System

In a non-interleaved memory system, all of the first bank of memory, bank 0, is addressed before the first long word of the second bank of memory, bank 1, all of bank 1 is addressed before the first long word of bank 2, and so on. Figure 1 shows this organization for two banks of N long words. (A long word is 4 bytes, or 32 bits, and is the natural unit of memory for the 68040.)

Bank 0 Bank 1

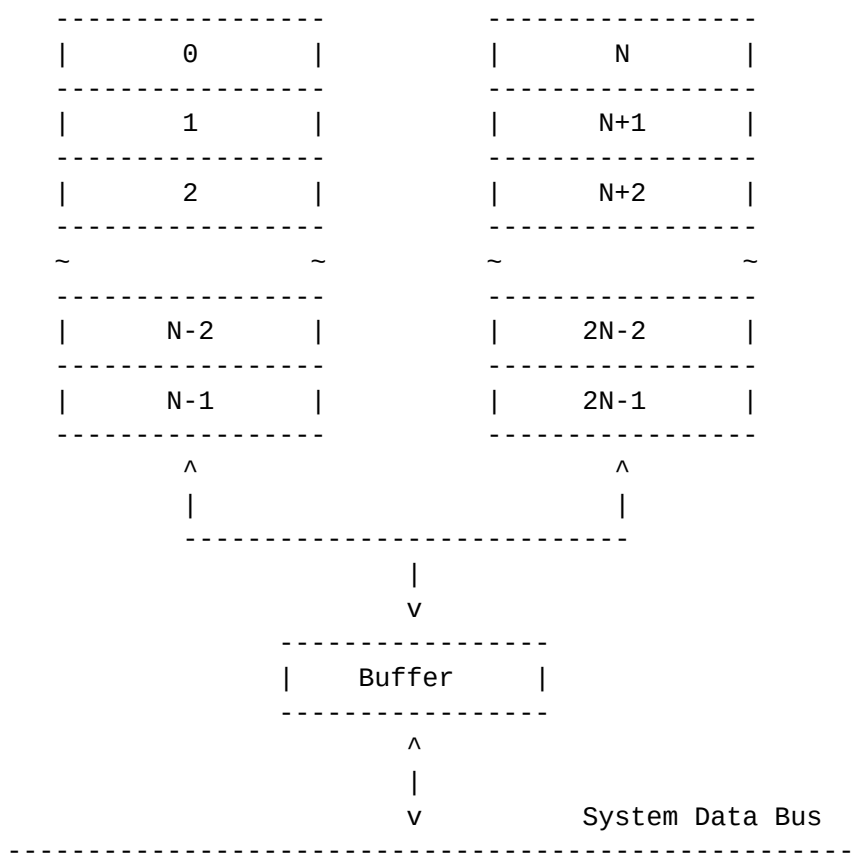

Figure 1. Non-interleaved Memory Organization

The 68040 performs burst accesses (a single bus transaction that reads or writes 16 bytes in 4 adjacent long words) to move data between its caches and memory. All 16 bytes come from one bank of DRAM in a non-interleaved memory system, so the time required to complete the transfer depends directly on the access time of the DRAM. Figure 2 shows an example of such a burst access. The time needed to access the 2nd, 3rd, and 4th long words is shorter because it uses a DRAM feature called "page-mode access."

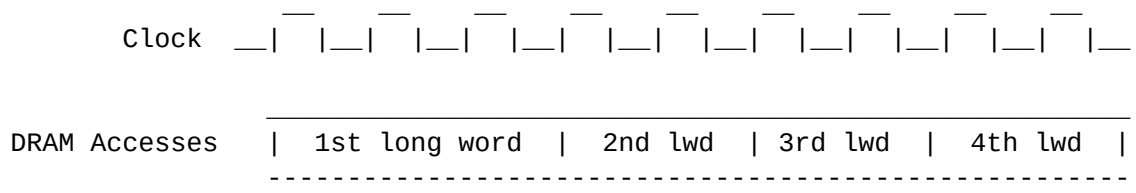

Figure 2. Non-interleaved Burst Access Timing

Interleaved Memory System

In an interleaved memory system, there are still two physical banks of DRAM, but logically the system sees one bank of memory that's twice as large. In the interleaved bank, the first long word of bank 0 is followed by the first long word of bank 1, which is followed by the second long word of bank 0, which is followed by the second long word of bank 1, and so on. Figure 3 shows this organization for two physical banks of N long words. All even long words of the

logical bank are located in physical bank 0 and all odd long words are located in physical bank 1.

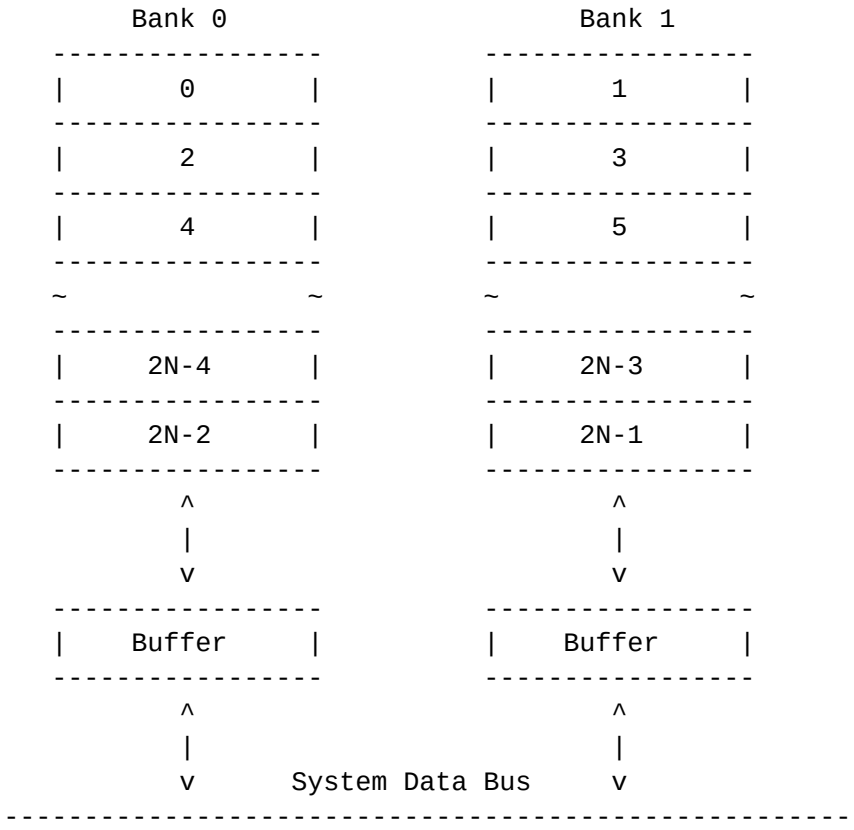

Figure 3. Interleaved Memory Organization

The interleaved memory configuration is designed to speed up 68040 burst accesses by as much as 30%. (The actual improvement depends on the system clock speed and the DRAM access time.) Since the four long words of a burst access are spread across two physical banks of DRAM, the individual accesses can be overlapped to hide part, or all, of the DRAM access time delay, as shown below in Figure 4.

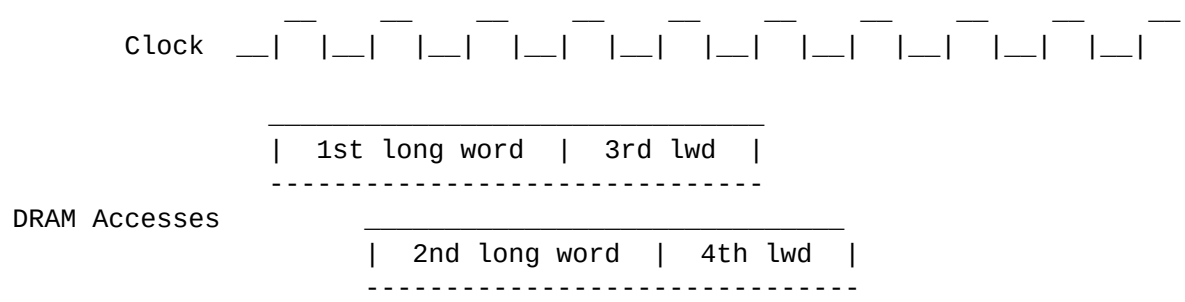

Figure 4. Interleaved Burst Access Timing

Centris 650 and Quadra 800 Memory Organization

Physically, the DRAM in a Centris 650 or Quadra 800 system is organized as 110 banks of memory, where each bank is 32 bits wide and 4MB or 16MB deep.

Logically, the DRAM is organized as 5 pairs of banks, any of which may or may not be interleaved. At system boot time, each pair of DRAM banks is examined; if they are the same size (4MB or 16 MB), the interleaved memory configuration for that bank pair will be enabled. Otherwise, the bank pair will be left in the non-interleaved configuration.

The memory controller in the Centris 610 or Quadra 800 is capable of operating with some bank pairs in the interleaved configuration and some bank pairs in the non-interleaved configuration. The type of memory access performed is determined dynamically at the start of each cycle based on the value of an "interleave configuration register" within the memory controller. ROM accesses can't be interleaved since there's only a single bank of ROM.

The Centris 650 and Quadra 800 main logic board contains 4MB or 8MB of DRAM and 4 DRAM SIMM sockets. Systems that contain 8MB on the main logic board (all Quadra 800 and some Centris 650 computers) already interleave the two 4MB banks soldered to the main logic board. Systems which have only 4MB soldered on the main logic board can't interleave the single soldered 4MB DRAM bank, although DRAM on SIMMs can still be interleaved.

Each DRAM SIMM can contain either one or two banks of DRAM. The Centris 650 and Quadra 800 use 72-pin DRAM SIMMs; these SIMMs have a 32-bit data path, allowing memory upgrades to be performed with a single SIMM. Single- sided SIMMs contain one DRAM bank; double-sided SIMMs contain two DRAM banks. A double-sided SIMM can't contain an interleaved bank pair since there aren't enough pins on the SIMM to accommodate the two 32-bit data buses required for interleaved memory. Interleaving can only be done between DRAM SIMM pairs.

The main logic board contains banks 0 and 1, SIMM slot 1 contains banks 2 and 3 (remember, SIMMs can be double-sided and contain 2 banks of DRAM), slot 2 contains banks 4 and 5, slot 3 contains banks 6 and 7, and slot 4 contains banks 8 and 9. SIMM slot pairs 1-2 and 3-4 are interleaved together whenever a bank pair is of the same size. For example, if 4MB SIMMs are placed in both SIMM slots 1 and 2, then that memory will be interleaved (banks 2 and 4). If a double-sided 8MB SIMM (that is, a SIMM with two 4MB banks on it) is placed in slot 1, and a single-sided 4MB SIMM is placed in bank 2, then two of the banks will be interleaved (banks 2 and 4) and one bank won't be interleaved (bank 3).

The gist of all this is that in order to maximally enable memory interleaving, memory upgrades should be performed with a pair of SIMMs, both of the same size. A single SIMM can be used for memory expansion, but will result in a portion of memory being non-interleaved. The system actually takes care of configuring everything automatically at boot, regardless of what memory is installed. However, by physically configuring DRAM in identically sized bank pairs, the fastest overall memory access is achieved (that is, the highest performance). The actual performance delta between an interleaved and non-interleaved memory system will depend on the application, and will vary from application to application.

Apple Internet Router 3.0.x and Apple Remote Access (9/94)

Revised: 9/13/94
Security: Everyone

Apple Internet Router 3.0.x and Apple Remote Access (9/94)

==========

Article Created: 11 March 1994
Article Reviewed/Updated: 12 September 1994

TOPIC ----------

This article describes running Apple Remote Access (ARA) 1.0 or 2.0, and the Apple Internet Router (AIR) 3.0.x on the same Macintosh. Also described are the versions of AppleShare are supported with ARA 2.0.

DISCUSSION ----------

It is possible to use ARA 1.0 (for dial-in access only) and the AIR 3.0 at the same time. However, how to do this is not intuitive and the AIR 3.0 manual does not give very many clues. Note, this solution was not tested by Apple and is not officially supported.

The port settings for the serial port ARA is setup to use must be cleared using the "Clear Port Info..." menu item under the Router Manager's "Edit" menu. To do this, expand the view for the serial port ARA is setup to use and click on the "DialUp" icon and select the "Clear Port Info..." menu item under the Router Manager's "Edit" menu. Then select the "LocalTalk" icon and do the same.

These are only necessary if the port had been "defined" at some point using the Router Manager software.

We have never done any testing with AIR 2.0 and ARA so we cannot say what might work. We do know that using any version of ARA for dial-out on a Macintosh running the AIR 2.0 software does not work.

The only ARA and AIR software combination that is supported and will work correctly together is ARA Multi-Port Server 2.0 or ARA Multi-Port Server 2.0.1, and AIR 3.0.1. Keep in mind that any port used by the ARA Multi-Port Server cannot be used by the AIR and vice versa.

AIR 3.0 uses Shared Library Manager 1.0 and does not work properly with ARA Multi-Port Server 2.0 because it requires Shared Library Manager 1.1.

The ARA Client-Only 2.0, ARA Personal Server 2.0, and ARA 1.0 software was not tested, and is not supported with any version of AIR software.

ARA Multi-Port Server 2.0 was only tested with AppleShare 3.0.3 and AppleShare 4.0.1 and is only supported with these versions of AppleShare.

Article Change History:
12 Sep 1994 - Made clarifications.
06 Apr 1994 - Combined articles, and updated information to ARA 2.0 and AIR 3.0.1.

PowerBook 160, 180: System Enablers on Install Me First (3/93)

Revised: 7/7/94
Security: Everyone

PowerBook 160, 180: System Enablers on Install Me First (3/93)

==========

Article Created: 17 March 1993

TOPIC ----------

Our Install Me First Disk has Enabler 111 version 1.0.1. I placed version 1.0.2 of Enabler 111 on our working copy of the Disk Tools Disk for the PowerBook 160 and 180.

I tried replacing the enabler with version 1.0.2 on this Install Me First floppy disk; clearly the Installer doesn't want this and no longer recognizes the disk as the correct one. This is true even replacing the enabler with the original one.

I did a regular install to a PowerBook 180 with copies of original disks. Then, I booted with a Disk Tools Disk and dragged version 1.0.2 of the enabler onto the PowerBook hard disk. When I restart, I get an error.

Is there any way to update our Install Me First Disks so that we have the latest Enabler files?

DISCUSSION ----------

Adding or removing files from Install Me First disks ISN'T recommended. The installer script often looks for specific file attributes besides filename, like version, modified date, and created date. If the installer script doesn't find exactly what it's looking for, it will abort.

System Enabler 111 version 1.0.2 is only required on PowerBook 160s and 180s with an Express Modem installed. The enabler is automatically installed when the Express Modem software 1.0.1 is installed.

System Enabler 111 version 1.0.2 will work on the PowerBook 160 and 180 without an Express Modem installed, so I suspect you may have downloaded the "corrupted" enabler that was posted on AppleLink. We replaced the corrupted enabler, and

you can download the enabler from AppleLink again.

StyleWriter II: Problems with M.Y.O.B. (3/93)

Revised: 3/25/93
Security: Everyone

StyleWriter II: Problems with M.Y.O.B. (3/93)

==========

Article Created: 12 March 1993

TOPIC ----------

M.Y.O.B. crashes or refuses to print when printing to the StyleWriter II when GrayScale is selected in the Print dialog box.

Is this a problem with the StyleWriter II driver or M.Y.O.B.?

DISCUSSION ----------

Apple Engineering has determined that the problem lies in the M.Y.O.B. software. Teleware has been notified of the problem, so we suggest contacting them directly for any further questions. Other printers are not affected.

To locate a vendor's address and phone numbers, use the vendor's name as a search string.

Macintosh: Shimmering Dialog Box at Start Up (8/95)

Revised: 8/9/95
Security: Everyone

Macintosh: Shimmering Dialog Box at Start Up (8/95)

==========

Article Created: 17 March 1993
Article Reviewed/Updated: 9 August 1995

TOPIC ----------

The Macintosh on restart freezes after Welcome To Macintosh disappears with either a bomb box and a system error OR an empty bomb box that "shimmers" on the screen. It also happens with extensions off. The menu bar is empty at the top of the screen. The Macintosh will boot using a System 7.1 Disk Tools disk, and the problem doesn't occur.

DISCUSSION ----------

This is not a problem with corrupt desktop files. This is usually a problem with a corrupt Finder Preferences file. The difference is the computer WILL boot with a System 7.1 Disk Tools disk. The solution to the problem is to boot with Disk Tools and trash the Finder Preferences file. On restart, the system will create a default Preferences file. If this doesn't solve the problem, then proceed with a clean install, because the Finder may be corrupt.

Also throwing At Ease in the trash while it's turned on will generate the same symptoms. At Ease modifies the boot blocks so the Macintosh will startup into At Ease. To set the boot blocks back, the At Ease control panel must be reinstalled, turned off, then removed. The manual gives complete instructions on how to properly remove At Ease.

A quick way to recover from improperly removing At Ease is to reset the boot blocks so that the Finder is the start up application. To do this follow these steps:

Step 1

Startup the computer from a floppy disk, such as the Disk Tools or the Utilities disk (for Performa Users).

Step 2

Drag the Finder outside of the System Folder.

Step 3

Drag the Finder back into the System Folder. (This blesses the System folder and resets the boot blocks to look for the Finder, not At Ease when the computer starts up).

You can now start up your computer normally.

Article Change History:
09 Aug 1995 - Added keyword and reviewed for accuracy.
23 Feb 1994 - Added steps to reset boot blocks.

AppleDesign Powered Speakers: Description (3/93)

==========

Article Created: 15 March 1993

TOPIC ----------

This article describes the AppleDesign Powered Speakers

DISCUSSION ----------

AppleDesign Powered Speakers are specifically designed for computer use and near-field listening. These speakers provide excellent stereo separation and sound quality while maintaining a private listening environment.

Noise-reduction circuitry is built into AppleDesign Powered Speakers to enhance sound clarity, and each speaker is magnetically shielded for use near computer displays and peripheral devices.

AppleDesign Powered Speakers are equipped with a dual-input mixer, so you can connect them to your CD-ROM drive and computer, then receive sound simultaneously from both. You can also connect these speakers to other audio devices, such as a portable CD player, cassette player or television.

Features

Audio Quality

- Tuned-port bass-reflex system for extended low-frequency response
- Active equalization for best frequency response at all listening levels
- Focused sonic dispersion to optimize output for personal, near-field listening
- Noise-reduction circuitry for audio clarity

Computer Connectivity and Use

- Dual-input mixer for computer- and CD-generated sound
- Magnetic shielding to avoid image distortion on computer displays
- Small, sleek design to fit on a desk
- Compatibility with virtually any personal computer, CD player or audio cassette player, or any television supporting sound output

Ease of Use

- Built-in dual-channel amplifier
- Power, volume, and balance controls conveniently located on the front panel
- Headphone jack to provide privacy
- Easy setup and installation

Ordering Information and Packing List

AppleDesign Powered Speakers
Order No. M4475LL/A
- Main (powered) speaker and satellite speaker
- Power-supply module (120-V input)
- Computer interconnect cable (with 3.5-mm miniplugs)
- CD stereo cable
- Insulated dual-strand speaker-to-speaker cable
- Instruction manual
- Limited warranty statement

Personal LaserWriter NTR for Windows: Description (Discontinued)

Revised: 6/2/94
Security: Everyone

Personal LaserWriter NTR for Windows: Description (Discontinued)

==========

Article Created: 5 April 1993

TOPIC ----------

This article describes the Personal LaserWriter NTR for Windows printer.

DISCUSSION ----------

Overview

The Apple Personal LaserWriter NTR for Windows printer is a flexible, high-performance PostScript laser printer.

Powered by a RISC processor, the Personal LaserWriter NTR prints documents up to five times faster than its predecessor, the Personal LaserWriter NT printer.

The Personal LaserWriter NTR for Windows is compatible with Windows and major MS-DOS applications because it uses Adobe PostScript Level 2 software and HP LaserJet IIP (PCL 4+) emulation. Automatic emulation-switching software allows DOS and Windows users to switch easily between PostScript and LaserJet IIP emulation modes.

The Personal LaserWriter NTR also offers plug-and-play installation. Parallel, serial, and LocalTalk ports connect the printer to Windows, DOS, and other computing environments. All ports stay active so you can send documents to any port, without having to change a single setting.

Power and Speed

- High-performance RISC processor
- Exceptionally fast first-page output
- Four pages per minute (maximum)

Compatibility with Windows and DOS

- Simultaneous connection to parallel, RS-232 serial, and LocalTalk ports
- Adobe PostScript Level 2 software and HP LaserJet IIP (PCL 4+) emulation
- Automatic emulation switching between PostScript and HP LaserJet IIP emulation modes; LaserTools Printer Control Panel software included

Print Quality

- 300-dpi resolution for quality text and graphics
- 75 fonts for printing in a wide range of sizes and styles

Convenience and Flexibility

- Compact, low-profile design fits easily on a desk
- Convenient printing on different types and sizes of paper; optional 250-sheet cassette available

Copyright 1993-1994, Apple Computer, Inc.

DISCUSSION

Marking Engine

- Canon LBP-LX laser-xerographic

Controller

- 16 MHz AMD AMD29005 RISC processor

Memory

- 3MB ROM
- 3MB RAM, upgradable to 4MB

Speed

- 4 pages per minute, maximum

Print Quality

- 300 dpi for text and graphics

Fonts

- 75 scalable fonts
  - 35 fonts in ROM from the following font families: ITC Avant Garde Gothic,

    ITC Bookman, Courier, Helvetica, Helvetica Narrow, New Century Schoolbook, Palatino, Symbol, Times, ITC Zapf Chancery, and ITC Zapf Dingbats
  - 40 additional Windows 3.1-compatible fonts on disk from the Bitstream TrueType Font Pack, including fonts from the following families: Bitstream Oz Handicraft, Clarendon, English, Fraktur, Freehand, Geometric, Humanist, Huxley Vertical, Imperial, Impress, Incised, Informal, Nuptial, Poster Bodoni, Revival, Square Slabserif, Staccato, Umbra, and Vineta
- Any TrueType or PostScript fonts

Interfaces

- Simultaneous connection to Centronics-type parallel, RS-232 serial, and LocalTalk interfaces

Paper Feed

- Automatic or manual with integral multipurpose tray
- Automatic with optional Personal LaserWriter 250-sheet Cassette Base and the Letter Cassette, Legal Cassette, Envelope Cassette, A4 Cassette, or B5 Cassette

Print Materials

- 16-lb to 28-lb (60- to 105-g/m2) paperbond
- Paper: U.S. letter, U.S. legal, A4, B5
- Most letterhead and colored stock, labels, and envelopes
- Medium-weight photocopier transparencies
- Envelopes:
  - minimum 3.8 x 7.25 inch (96 x 184 mm)
  - maximum 7.4 x 10 inch (188 x 255 mm)

Paper Capacities

- Cassette: up to 70 sheets of 20-lb. (75-g/m2) paper
- Optional paper cassette: 250 sheets of 20-lb. (75-g/m2) paper
- Optional envelope cassette: 15 envelopes

Printable Surface

- Maximum printable line: 8.0 in. (203.2 mm)
- Minimum margins: 0.25 in. (6.35 mm) (actual printable area may vary depending on the application)

Size and Weight

- Height: 8 inches (20.3 cm)
- Width: 15 inches (38 cm)
- Depth (with optional letter-size cassette): 18.3 inches (46.4 cm)
- Weight: 29.5 lb. (13.35 kg)

Power Requirements

- U.S./Japan: 90 to 110 volts AC, 48-52Hz, 58-62 Hz

• Europe/Australia: 220 to 240 volts AC, 48-52 Hertz

Maximum Power Consumption

• 600 watts at 115 volts
• 550 watts at 220 volts

Operating Environment

• Temperature: 50 to 90° F (10 to 32.5° C)
• Humidity: 20% to 80% noncondensing
• Toner cartridge transit environment: -4 to 140° F (-20 to 40° C)

LaserWriter Pro 600 for Windows: Description (4/93)

Revised: 4/5/93
Security: Everyone

LaserWriter Pro 600 for Windows: Description (4/93)

==========

Article Created: 5 April 1993

TOPIC ----------

This article describes the LaserWriter Pro 600 for Windows printer.

DISCUSSION ----------

The Apple LaserWriter Pro 600 for Windows provides 600 dots-per-inch (dpi) resolution and lets you print text at four times the resolution of conventional laser printers.

Because it uses Apple PhotoGrade and FinePrint technologies, the LaserWriter Pro 600 can give you high-quality images and graphics even at 300 dpi. PhotoGrade technology allows up to 91 levels of gray, the equivalent of 1000 dpi. FinePrint smooths out lines and curves in text and line art that would otherwise appear jagged.

The LaserWriter Pro 600 for Windows is compatible with Windows and major MS-DOS applications because it uses Adobe PostScript Level 2 software and HP LaserJet IIP (PCL 4+) emulation. Automatic emulation-switching software allows DOS and Windows users to switch easily between PostScript and LaserJet IIP emulation modes.

The LaserWriter Pro 600 offers plug-and-play installation. Parallel, serial, and LocalTalk ports connect the printer to Windows, DOS, and other computing environments. All ports stay active so you can send documents to any port, without having to change a single setting.

For added flexibility, the LaserWriter Pro 600 comes with two paper trays and an expandable array of options, including a 500-sheet feeder and a 75-envelope feeder. The LaserWriter Pro 600 has a total paper-handling capacity of 850 sheets.

Print Quality

- 600-dpi resolution for high-quality text in PostScript mode
- PhotoGrade for enhanced images at 300 dpi, FinePrint for smooth text and lines in PostScript mode
- 300-dpi resolution HP LaserJet IIP (PCL 4+) emulation mode
- 75 fonts for printing in a wide range of sizes and styles

Compatibility with Windows and DOS

- Simultaneous connection to parallel, RS-232 serial, and LocalTalk ports
- Adobe PostScript Level 2 software and HP LaserJet IIP (PCL 4+) emulation
- Automatic emulation switching between PostScript and HP LaserJet IIP emulation modes; LaserTools Printer Control Panel software included

Convenience and Flexibility

- Two (100- and 250-sheet) paper trays
- Optional envelope feeder (75-envelope capacity)
- Optional 500-sheet feeder
- Maximum capacity with options: 850 sheets

Security: Everyone

LaserWriter Pro 600 for Windows: Specifications

==========

Article Created: 5 April 1993

TOPIC ----------

This article gives the technical specifications of the LaserWriter Pro 600 for Windows.

DISCUSSION ----------

Marking engine

• Canon EX laser

Controller

• 25-MHz 68030 CPU, ASICs, and I/O processors

Memory

• 8MB RAM, expandable to 32MB
• 2MB ROM

Speed

• Eight pages per minute (maximum)

Print Quality

• 600 dpi
• 300 dpi enhanced with PhotoGrade and FinePrint
• 300-dpi HP LaserJet IIP (PCL4+) emulation

Fonts

- 75 scalable fonts
  - 35 fonts in ROM from the following font families: ITC Avant Garde Gothic, ITC Bookman, Courier, Helvetica, Helvetica Narrow, New Century Schoolbook, Palatino, Symbol, Times, ITC Zapf Chancery, and ITC Zapf Dingbats
  - 40 additional Windows 3.1-compatible fonts on disk from the Bitstream TrueType Font Pack, including fonts from the following families: Bitstream Oz Handicraft, Clarendon, English, Fraktur, Freehand, Geometric, Humanist, Huxley Vertical, Imperial, Impress, Incised, Informal, Nuptial, Poster Bodoni, Revival, Square Slabserif, Staccato, Umbra, and Vineta
- Any TrueType or PostScript fonts

Interfaces

-

Recommended Duty Cycle

- Toner cartridge: 6000 pages at 5% density
- Printer: 450,000 pages (minimum)

Print Materials

- Media: 20- to 24-lb. (60- to 80-g/m2) media from cassette, up to 32-lb. (135-g/m2) media manually
- Paper: U.S. letter, U.S. legal, A4, B5
- Labels, envelopes, most textured stock, and transparencies

Paper Capacities

- Standard
  - 100-sheet multipurpose tray (can also hold up to 10 envelopes)
  - 250-sheet letter cassette
- Optional
  - 500-sheet feeder
  - Envelope feeder: up to 75 envelopes

Printable Surface

- Maximum printable line: 8.1 in. (205.9 mm)
- Minimum margins:

left and right	0.1379 in. (3.5 mm)
top	0.114 in. (2.9 mm)
bottom	0.197 in. (5.0 mm)

Size and Weight

- Height: 12.1 in. (30.8 cm)
- Width: 16.8 in. (42.5 cm)
- Depth: 16.9 in. (42.9 cm)
- Weight: 39 lb. (17.7 kg)

Power Requirements

- U.S./Japan: 90 to 110 VAC, 58 to 62 Hz; 103.5 to 126 VAC, 58 to 62 Hz

- Europe/Australia: 194 to 264 VAC, 48 to 52 Hz

Power consumption

- Standby: 95 W (average)
- Operating maximums
  - 560 W at 115 V
  - 530 W at 220 V

LaserWriter Select 310 for Windows: Description (4/93)

Revised: 4/5/93
Security: Everyone

LaserWriter Select 310 for Windows: Description (4/93)

==========

Article Created: 5 April 1993

TOPIC

This article describes the LaserWriter Select 310 for Windows.

DISCUSSION

The LaserWriter Select 310 for Windows is a 5 page-per-minute personal laser printer for people working in Windows computing environments.

The LaserWriter Select 310 for Windows delivers high-quality printed output from Windows and major MS-DOS applications. It offers 53 scalable fonts, including such popular standards as Times, Helvetica, and Courier.

To start using the LaserWriter Select 310, simply connect it to your computer. A Centronics-type parallel interface is included, so there's no need to purchase additional interface cards or software drivers.

The LaserWriter Select 310 includes a cassette tray that holds 250 sheets of paper and a manual paper feed for small jobs requiring personal attention. You can also add an optional 250- or 500-sheet paper tray.

Features

Print Quality

- 300-dpi resolution for quality text and graphics
- Adobe PostScript printing
- 53 fonts for printing in a wide range of sizes and styles

Compatibility with Windows and DOS

- Centronics-type parallel interface
- Adobe PostScript software and ASCII text emulation
- Automatic emulation switching between PostScript and ASCII text modes; LaserTools Printer Control Panel software included

Versatility

- 250-sheet automatic tray and manual-feed tray included
- Optional paper-handling capabilities for up to 800 sheets of paper (includes different media)
- Compact design fits on a desk

QMS 410 Printer: System 7 Compatibility (3/93)

Revised: 3/16/93
Security: Everyone

QMS 410 Printer: System 7 Compatibility (3/93)

==========

Article Created: 10 March 1993

TOPIC ----------

Is the QMS 410 printer compatible with System 7?

DISCUSSION ----------

According to QMS, version 9.4 and higher of the QMS firmware is System 7 compatible. On 3/1/93, the current version was 9.4a.

To check the firmware version, take the printer off line, press the "test" button, and put the printer back online.

Two test pages will print; the first one will have a printer ID box in the top left corner. The fourth line of this box indicates the firmware version.

If customers have firmware version 6, 7, or 8, they can call QMS for upgrade information. If customers still have level 1, they will have send their printer in to QMS for the upgrade.

QMS has modified the Apple LaserWriter driver to add various features to it, such as a new envelope selection and different size paper. This driver is available directly from QMS.

The Apple LaserWriter driver will work with the QMS 410. QMS suggests that an alias of the LaserWriter printer driver be in the extensions folder and that the original driver should be located in the root directory of the system folder.

Apple Internet Router 3.0, IP Extension, & Public Zone (3/93)

Revised: 3/16/93
Security: Everyone

Apple Internet Router 3.0, IP Extension, & Public Zone (3/93)

==========

Article Created: 12 March 1993

TOPIC -----

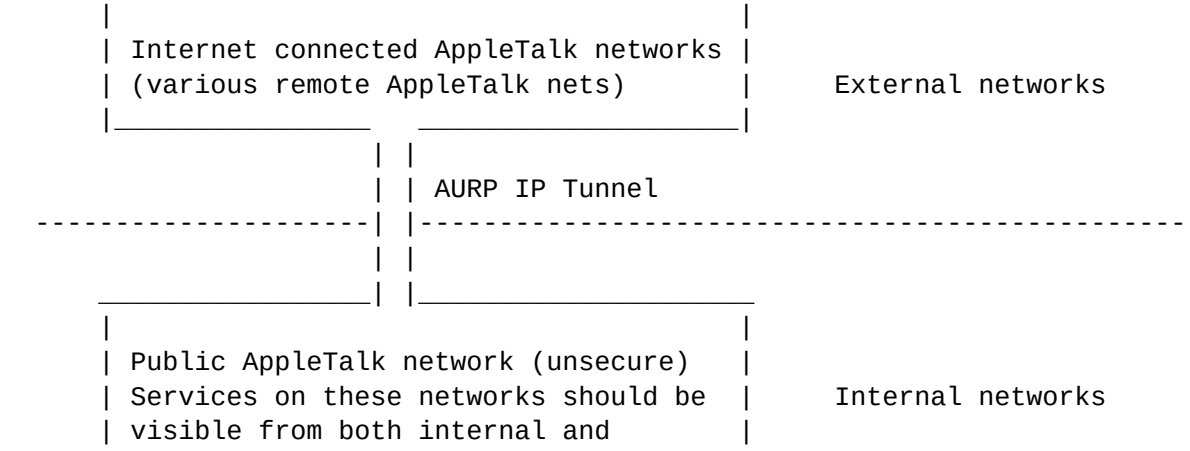
I want to allow remote and local AppleTalk networks to connect to a "public network". I want the "clients" attaching to this public network to see the services on that public network only and to have no knowledge of the peer networks attached to the public network. I may not have control of those who wish to connect to my network, so I need a method to manage the "filtering" of the inbound and outbound AppleTalk traffic.

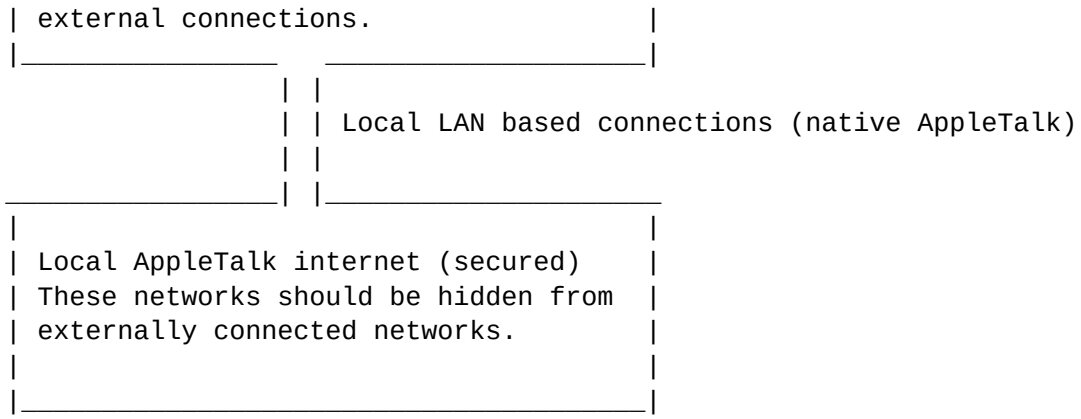
How can I set this service up using AIR 3.0 with the IP extension?

DISCUSSION -----

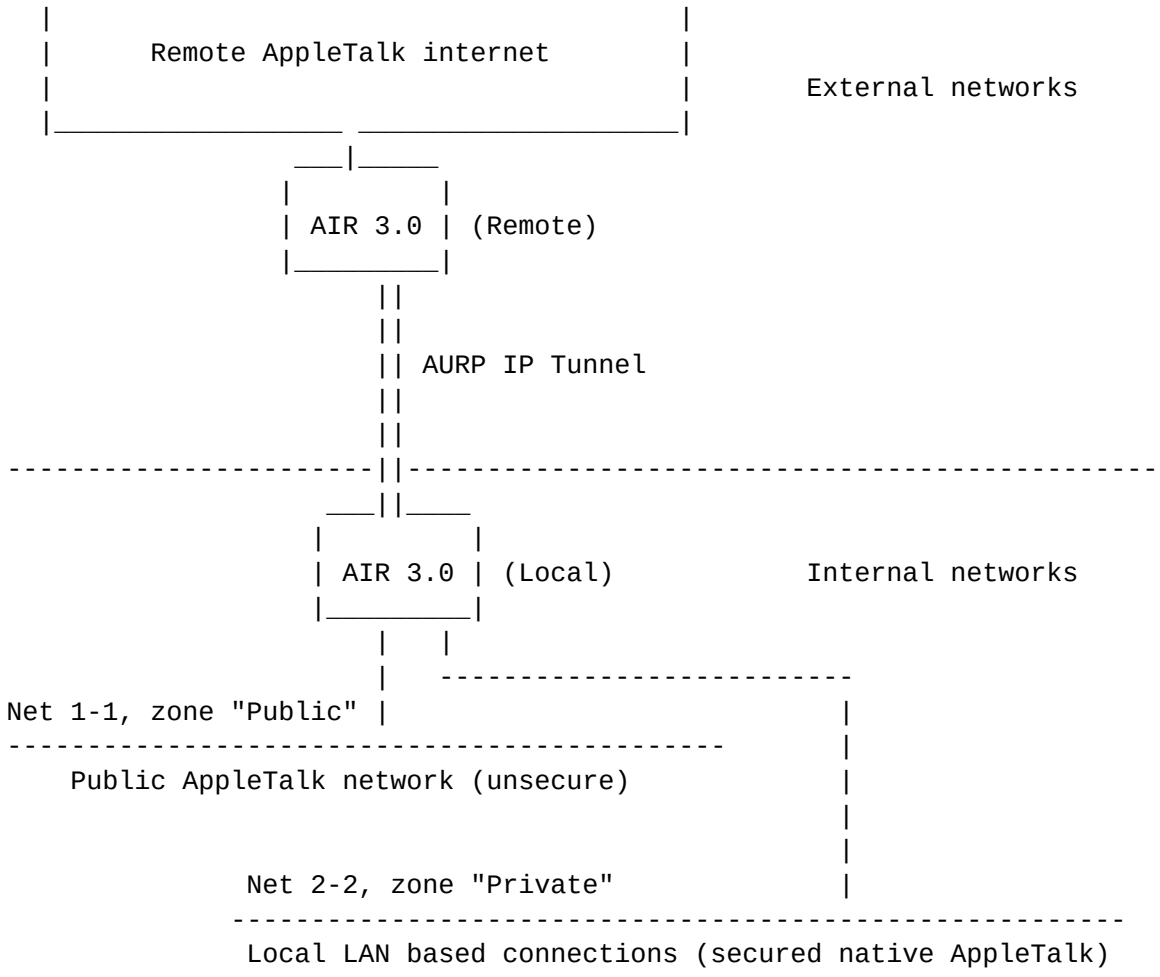
The information provided below will give you with the type of functionality you're looking for.

First, the following diagrams.





The first diagram lays out the basic design of the network; more detail is added below to show a more workable solution.



The Local Apple Internet Router

Given this configuration, you would follow these steps to configure the routers:

1) In the port info box for the IP tunneling port, deselect "Use only host ID's listed. This would allow any remote site to connect to this router to establish an AURP tunnel.

2) Select "Allow more than 15 hops". This takes care of any problems associated with remote networks that are more than 15 hops away from the public network.

3) Select "Remap remote network numbers". This will allow remote networks which use the same network number as the public network to establish an AURP connection. Chose a range of networks large enough to satisfy the expected number of remote networks you'll have to remap. This will vary from situation to situation, but with a possible range 65,279 - (local network numbers used) you should be able to spare a few thousand numbers for remote remapping purposes.

4) Select "Cluster remapped networks". This is optional and only necessary if you are concerned about the size of the routing table or RTMP packets sent to the local networks.

5) Select "Hide all networks except those listed" from the "Hide from this network" pop-up menu. Input the network number of the public network in the list of networks not to hide, in this example you would list 1-1. This would hide all your local networks to any of your AURP connected remote internets.

6) Configure all other local network numbers and zone assignments.

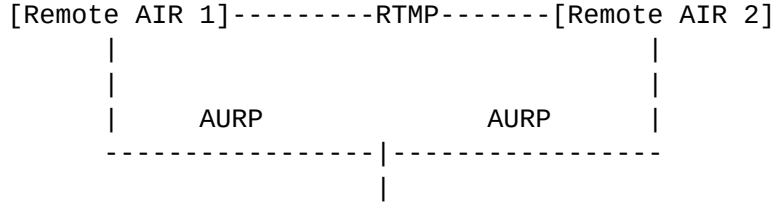
The Remote Apple Internet Router(s)

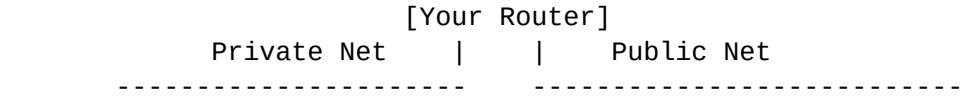
The remote router would only need to supply the address of your router and set up any options specific to their site (network number remapping, clustering, etc.).

Considerations given this configuration:

- Zones from remote sites will show up in the zone list on the local (secure) AppleTalk internet. Even though zones will show up, no services should be visible because the secure networks are hidden and thus no path exists for remote devices to respond to NBP requests.

- No routing loops can be present. In other words, no remote site could have multiple connections to your public network and also have RTMP-based connectivity between themselves.



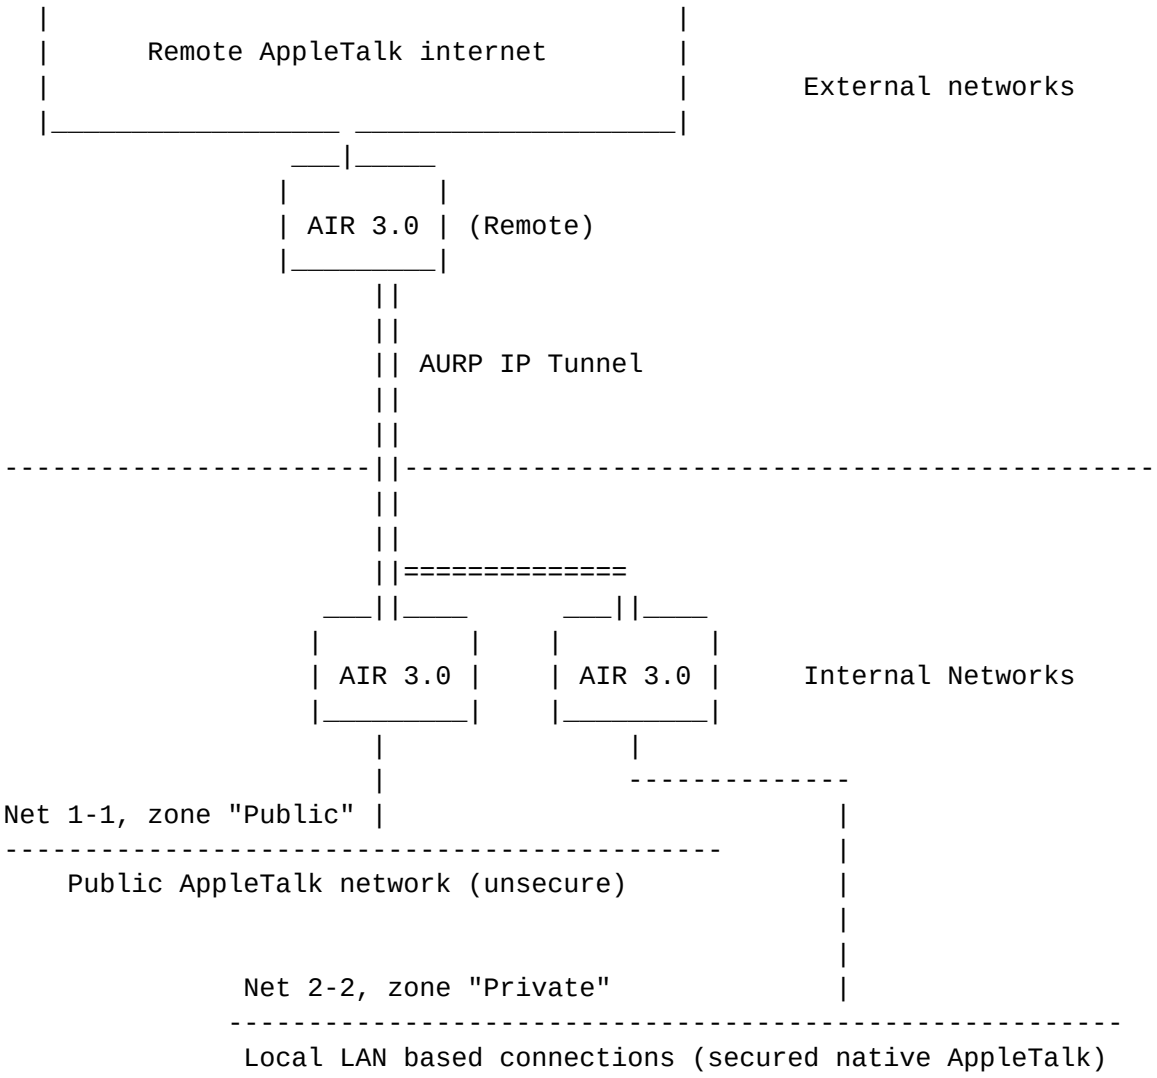


This type of configuration will not work unless you don't use network number remapping.

Private (Secured) Network

Your private (secured) network nodes would not be able to connect to other "public" networks which may be advertised on the Internet without adding another interface to the router, or by adding another router, and changing the security configuration. We just can't come up with a good general way to provide the best of both worlds such as is possible using IP.

Now let's see if I can make it a little better:



What We're trying to show here is a second Apple Internet Router connected via IP to the local public network. This configuration offers some advantages over the first configuration.

- The biggest advantage is that your local users wouldn't be bothered seeing random zones appear because you would be connected to the public network via an IP tunnel over which you would only see a single route to network 1, and a single zone "Public". This would, for the same reason, only increase the size of a local RTMP packet by a single network entry.

- You could easily configure the second router to also connect to other "public" Internet networks -- although security would still have to be carefully thought through for your private network users. Security would need to be considered because in order to enable your private network-based users to connect to remote "public" networks, you have to supply a route back into your private networks which means they cannot be hidden. You could hide your file servers and your printers using the device hiding features of the Apple Internet Router. But NBP-based security is really not all that secure since the devices could still be attacked if someone was able to discover their network and node information.

WorldScript: Using with Applications (3/93)

Revised: 3/18/93
Security: Everyone

WorldScript: Using with Applications (3/93)

==========

Article Created: 18 March 1993

TOPIC ----------

I need some clear documentation on what capabilities WorldScript adds to the operating system and how applications use these new capabilities. I have these specific questions:

1) What third parties have announced "WorldScript aware" applications?

2) Will HyperCard be "WorldScript aware"?

3) Is it possible for an application, say a word processor, to switch on the fly from one language to another? How is the script used for application menu items and dialog boxes selected?

DISCUSSION ----------

There is currently no single source for documentation on WorldScript that we're aware of. There are a few articles in the Tech Info Library that provide some depth on WorldScript (search on "WorldScript"). If you want to delve further into understanding international script systems, there are also a couple of good sources for that information:

• Macintosh Worldwide Development: Guide to System Software (available from APDA)

•Inside Macintosh, Volume VI (Worldwide Software Overview chapter)

Here are the answers to your specific questions:

1) The only application we're aware of is a product from Nisus Software, Inc. It's a fully WorldScript-aware word processor, and can use multiple scripts at the same time. The name of the application is

NISUS.

2) HyperCard version 2.1 is System 7.1 compatible, but doesn't support WorldScript. Apple is working on making HyperCard WorldScript-aware.

3) Switching between different "languages" is one of the key features of WorldScript. You do this through a menu in the upper right corner of the screen.

   The script for menu items and dialog boxes remains the same as the base system that WorldScript is installed on.

Imaging Products: Where to Find Installer Disks (1/95)

==========

Article Created: 15 March 1993
Article Reviewed/Updated: 24 January 1995

TOPIC ----------

Where can I find the install disks for Apple imaging products. Specifically I'm looking for the Install disks for the Color Printer, Color Scanner, and the StyleWriter II.

DISCUSSION ----------

You can find the complete set of disk images for Apple printers on AppleLink. Individual printer drivers are available on the online services Apple posts software updates on.

The disk images for the Apple Color Scanner cannot be posted since the Ofoto software is included on the disks. However, The Color Scanner driver itself can be found in the same locations as the individual printer drivers.

These articles can help you locate software updates mentioned here:

- Where To Find Apple Software Updates
  Lists online services for "free" Apple software updates

- Obtaining Apple Product Support in the USA
  Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech. Info. Library

Windows 3.1: Apple Events on IBM PC Computers (3/94)

==========

Article Created: 4 March 1993
Article Reviewed/Updated: 9 March 1994

TOPIC ----------

Can I use Apple Events features on an IBM PC?

DISCUSSION ----------

IBM PCs and compatibles don't support Apple Events, but Windows 3.1 can simulate some Apple event-like procedures.

Send Message (in ScriptMaker) is the way to run another application or open a document from FileMaker Pro 2.x for Windows. This isn't documented in the user manual, and only works under Windows 3.1.

You can only use "open document." The three radio buttons should work:

- If you choose Document, specify the document you want to open or the application you want to run.
- If you choose Script Text, specify the same things you'd put in the edit control in the Run dialog of the program manager.
- If you choose Field Value, the contents of the field should follow the same rules as the contents of Script Text.

Only the first option (Bring target application to foreground) works.

This information came from Claris Corp.

LaserWriter IIg: Troubleshooting Macintosh and IBM Connections

Revised: 3/19/93
Security: Everyone

LaserWriter IIg: Troubleshooting Macintosh and IBM Connections

==========

Article Created: 4 March 1993

TOPIC ----------

Here is a basic outline to use when troubleshooting a LaserWriter IIg when connected to both a Macintosh and an IBM. If the configuration is IBM only, you may ignore the "Verify Connection to the Macintosh" section.

DISCUSSION ----------

Verify Connection to the Macintosh
---

1) Hook up the printer to the Macintosh using two known good LocalTalk boxes and cable.

2) Set the select switch to 0 and turn on the printer.

3) In the Chooser, select the printer (If you can't see the printer, you have a hardware problem).

4) Try printing a window from the desktop.

If this works, the printer is OK.

Verify IBM Connection
---

1) Use a Null-Modem Cable that connects from the IBM to the IIg.

2) Leave the connect switch set to 1, this will set up the DB-25 Serial port to 9600 Baud, HP Emulation.

3) Issue the proper Mode commands:

MODE COM*:96,n,8,1,p (Where * is the number of the COMM PORT.)

MODE LPT1:=COM*

4) From DOS, not from Windows, perform the following:

Type CTRL-P (This will direct further output to the LPT device.)

Type DIR followed by a RETURN.

Type CTRL-L (This sends a form feed command to eject the page.)

Type CTRL-P (This will redirect the output to the screen.)

You should see the light of the LaserWriter IIg blinking, and then it should produce a printout of the directory of the computer.

If you don't get output at this point, you have a hardware failure. This can be either in the Printer, Cable or Computer.

If the printer does produce a printout, but you can't get the output to work with Windows, then you have a software configuration issue.

Windows 3.x: Printing to LaserWriter IIg (3/94)

==========

Article Created: 4 March 1993
Article Reviewed/Updated: 9 March 1994

TOPIC ----------

We're using IBM PCs on a network running Windows 3.0, and we're trying to print to LaserWriter IIg printers, connected serially through DEC servers. All fonts print fine except Zapf Dingbats. Knowing that font isn't installed in ROM on the IIg, is there a fix for Windows 3.0 (or 3.1) that allows printing the Zapf Dingbat fonts over the network?

DISCUSSION ----------

First, convert the Zapf Dingbats Adobe Type 1 font that comes with the LaserWriter IIg, from resource fork format to text format. You can do this with a utility called UnAdobe.

Then, prepend the font text with "serverdict begin 0 exitserver" and append an end of file (CTRL-D). In other words:

```
  %%Begin Download
  serverdict begin 0 exitserver

..
  Text of font
.
.
  eof (CTRL-D)
  %%End Download
```

This will permanently download the font until the power is cycled.

This information is available on pages 39 and 40 of the LaserWriter Reference manual.

Windows 3.x: Printer Driver Prints Incorrectly on LW NTR (3/94)

==========

Article Created: 4 March 1993
Article Reviewed/Updated: 9 March 1994

TOPIC ----------

If I use the recommended NT/NTX printer driver in Windows and try to print envelopes, the software will try to print down the center of the engine (where envelopes feed on a LaserWriter II). But the NTR feeds envelopes on the side of the engine, and this doesn't work.

DISCUSSION ----------

The only suggestion we have is to contact the manufacturer of the driver. Request that they place in the Page Setup dialog box the flexibility ofselecting envelope-edge feed or envelope-center feed.

We're sorry but we have no influence on third-party printer drivers written for the Windows environment.

Zenith 386/25: Printing ASCII to LaserWriter IIg (3/93)

Revised: 3/19/93
Security: Everyone

Zenith 386/25: Printing ASCII to LaserWriter IIg (3/93)

==========

Article Created: 4 March 1993

TOPIC ----------

We connected a LaserWriter IIg to our network via LocalTalk. We can successfully print PostScript files to it from both the Macintosh systems and PC systems (through Windows 3.1 to a Novell NetWare 386 print queue) over LocalTalk.

We also want to connect the LaserWriter IIg to the network serially so MS-DOS users (version 5.0) can issue a NetWare "NPRINT" or "CAPTURE" command and send text files over the network to the serial port of the LaserWriter. We would like serial printing to be at least 9600 baud.

So far, our serial print tests haven't been over the network, just by direct-connecting the PC to the printer using a serial cable. The Thumb Switch on the LaserWriter IIg is set to Position 1.

The pinouts on the Zenith 9-pin serial port are as follows:

1 - CD
2 - Receive Data
3 - Transmit Data
4 - DTR
5 - Ground
6 - DSR
7 - RTS
8 - CTS
9 - Ring Indicator

The test:

1) Direct-connect the serial ports of the PC and the printer via the serial cable.

2) On the PC, issue the DOS MODE command to redirect output from LPT1 to the COM port to which the cable is attached:

```
MODE LPT1=COM1
MODE COM1:9600,n,8,1,r
```

3) Do a DOS Print Screen (SHIFT PRTSCRN) in an attempt to send a screen dump from the PC to the LaserWriter. Result: The cursor on the PC jumps to the top left corner of the screen and hangs -- no flashing light on the LaserWriter, no printout, and the PC must be rebooted.

4) Do a DOS PRINT command to send a text file from the PC to the LaserWriter. We got the same result as above.

Which Thumb switch position should we use? What is the wiring diagram for the serial cable which will work between the Zenith 386/25 DB-9 port to the LaserWriter IIg?

An HP LaserJet IIP can print an ASCII text file, so shouldn't the LaserWriter IIg be able to print an ASCII text file if it's in HP LaserJet IIP emulation mode?

DISCUSSION ----------

The cable has to be a NULL MODEM cable (also called a MODEM ELIMINATOR cable). Based on the Zenith DB-9 connector information you gave us, the serial cable should be wired as follows:

Zenith DB-9 Connector			LaserWriter IIf/IIg DB-25 Connector	
Signal	Pin#		Pin#	Signal
SGnd	5	----------	1	SGnd
TxD	3	----------	3	RxD
RxD	2	----------	2	TxD
DSR	6	----------	20	DTR
DTR	4	----------	6	DSR

Since the PC compatible is using hardware hand shaking, it's necessary to set up the LaserWriter IIf or IIg to do hardware hand shaking as well. Switch position 1 will give you a HP LaserJet IIP emulation, 9600-baud connection with 8 data bits, 1 stop bit, no parity, and DTR flow control. The Owner's Manual for the LaserWriter IIg has a complete description of the thumb wheel settings.

The LaserWriter IIf or IIg, when in HP LaserJet IIP mode, does print ASCII text, just like the HP LaserJet IIP.

When setting up the serial port, type the following at the MS-DOS prompt:

```
MODE LPT1=COM1
```

```
MODE COM1:9600,n,8,1,p
```

The second line is the proper mode command for the serial port when using a printer.

Windows to Macintosh: Difficulties When Moving Documents (3/94)

==========

Article Created: 4 March 1993
Article Reviewed/Updated: 9 March 1994

TOPIC ----------

I'm trying to use Word Perfect in a multi-vendor environment. While WordPerfect works well moving between Windows and the Macintosh, I have some problems with documents reflowing, due to different font metrics across the two platforms.

Now that Windows has TrueType, it would appear that this should be easy. I have these specific questions:

1) Are the font metrics for TrueType on a Macintosh and TrueType for Windows the same?

2) Are the font metrics of Macintosh bitmapped fonts and Windows bitmapped fonts the same (for at least the basic fonts; Times, Helvetica, Courier)?

3) How can I create documents or templates on one platform that will move to the other platform (that is, Macintosh to Windows or Windows to Macintosh) without the page breaks changing due to reflowed text?

DISCUSSION ----------

1) The fonts themselves may be the same, but the TrueType engines on the two platforms are different. Apple did the TrueType engine for the Macintosh and Microsoft did the TrueType engine for Windows. So there are differences in how TrueType fonts are represented.

2) Bitmapped fonts on the two platforms are very different.

3) At this time, you can't. You'll find many more problems than just the reflowing of text causing page layouts to change. You'll find that all the style changes will go from one platform to another as well.

There's a long way to go before moving documents across platforms without losing something in the process.

NetWare: Time Stamps Cause Unrecognized Files in QuickTime 3/93

Revised: 3/15/93
Security: Everyone

NetWare: Time Stamps Cause Unrecognized Files in QuickTime 3/93

==========

Article Created: 4 March 1993

TOPIC -----

I'm using Novell 3.11, NetWare for the Mac 3.011, and System 7. I discovered that NetWare for the Macintosh doesn't provide a "transparent" file system like a standard AppleShare server. There are problems with QuickTime and backup systems.

DISCUSSION -----

NetWare changes a file in two ways when copied onto a NetWare volume:

- The modified time of the file is truncated to an even number of seconds.
- The created time is set to (an even approximation of) the current time, thus you get a file with a modifed time earlier than the creation time.

Because of the way the Macintosh operating system handles time stamps, these two changes can cause potential problems with QuickTime, backup systems, and compiler "make" systems. Whether they do cause problems depends on your software and how you use it.

How To Reproduce the Problem

Here's how to reproduce the problem using QuickTime, it requires:

- An application to play and copy QuickTime movies (for example, Simple/Movie Player from Apple)
- A QuickTime movie

- An application or DA where you can paste your movie (the QuickTime compatible Scrapbook will do)

All these should reside on a local Macintosh hard disk or on a normal AppleShare volume. Follow these steps:

1) Open the QuickTime movie with the application and copy it to the Clipboard.

2) Open the application where you'll paste it from the Clipboard.

3) Play the movie from within the application where you pasted it.

4) Move the movie and the application where it's pasted to another location on your local Macintosh hard disk or normal AppleShare volume.

5) Open the application where it's pasted again and play the movie. QuickTime will search for the movie because you've moved it. Once found (probably very quickly) it will play.

6) Move the movie onto your NetWare volume. Remove the original (that is, keep just the copy on NetWare).

7) Open the application it's pasted to again and play the movie. QuickTime will search for the movie and fail to find it. Manually locate the movie using QuickTime's dialog and select it. QuickTime will report "not a valid movie file."

Note that the movie is actually a valid file and you can repaste it into the application. But every time you move the movie off the NetWare volume and back again (or onto another NetWare volume), the playback will break and you'll have to repaste.

This occurs because NetWare changes the timestamps on the file that QuickTime uses to check whether the file is the correct one. Any program that relies on timestamps (backup systems, compiler makes) may fail for the same reason, if files are copied to NetWare volumes.

If you use NetWare, check very carefully that things are working, especially your backups. You may use NetWare without any problems, and much software isn't affected. But other software will be affected, and you may not notice the damage immediately. Its full effects aren't known.

Novell is fixing this problem in version 4.0 of Netware for Macintosh, and is working on the problem in 3.11.

System 7.1: Bad or Missing Date Format

Revised: 3/15/93
Security: Everyone

System 7.1: Bad or Missing Date Format

==========

Article Created: 15 March 1993

TOPIC ----------

In System 7.1, dates aren't displayed or contain garbage in the Finder windows. In the Date & Time control panel, the U.S. Date format contains garbage. Here are the steps we tried to remedy this problem:

1) Trashed the Date and Time control panel.
2) Zapped the PRAM.
3) Reinstalled the system software over the existing system software.

These steps didn't resolve the problem.

DISCUSSION ----------

After further investigation, we discovered that the format information is kept in the System suitcase file. We did this by changing the date format to a custom format and checking the modified date and time. We then verified this by examining the system file using ResEdit. There's a resource in the system file that contains all date formats.

Here's the procedure to resolve this issue:

1) Start up using the Disk Tools disk.

2) Be sure to backup any non-Apple sounds and keyboard layouts.

3) Drag the System suitcase file to the Trash, and select Empty Trash from the Special menu.

3) Restart the computer using the Install disk, and follow the normal system software installation procedures.

PrintMonitor 7.0.1 and 7.1: Differences (3/93)

==========

Article Created: 25 March 1993

TOPIC --------------------

What are the differences between PrintMonitor 7.0.1 and 7.1?

DISCUSSION --------------------

Compared to 7.0.1, PrintMonitor 7.1 has only cosmetic and localization changes.
• The word "LaserWriter" was replaced with the word "Printer" in a dialog box.
• A change was made to the time format for Arabic.

DART 1.5.3: Version Change History (12/94)

Revised: 12/23/94
Security: Everyone

DART 1.5.3: Version Change History (12/94)

==========

Article Created: 18 March 1993
Article Reviewed/Updated: 23 December 1994

TOPIC ----------

This article details the version change history for last three versions of DART, as well to where to locate a copy of DART.

DISCUSSION ----------

What Is DART?

DART (Disk Archive/Retrieval Tool) is an application that enables you to duplicate Macintosh, Lisa, Apple II, or MS-DOS disks, save disk images, and create disks from image files. DART 1.5 can read disk image files in DART, DiskMaker, or Disk Copy format. DART 1.5 image files are compressed, approaching a reduction in size comparable to that obtained by using a commercial compression utility. DART 1.5 is System 7.0 "savvy", and implements a custom Apple event mechanism to automate the conversion of older DART or Disk Copy files to 1.5 format. The conversion process can be run by "remote control" (even across a network!) using the accompanying HyperCard stack. (For more information, please refer to the DART User Manual.)

What's New in version 1.5.3

• Compatibility with Centris 660AV, Quadra 660AV, and Quadra 840AV.

• Compatibility with Apple Event Manager 1.0.1 (a component of AppleScript).

Note: A -64 error occurs launching DART 1.5.3 on a Power Macintosh, but if you click OK, DART continues and everything works as expected.

What's New in version 1.5.2

• Compatibility with new Macintosh Quadra 800 and Centris machines.

- Under certain circumstances, it was possible for DART to open a corrupted Disk Copy file and create an identically corrupted disk (or image file) from it. Checksums on source disk images are now verified correctly, and DART will always display a warning message if the expected and actual checksum values don't match. (Note that while a damaged Disk Copy file can no longer be converted to DART format, it's still possible to make a disk from it and potentially salvage the data on that disk.)

- Fixed a minor (but annoying) display glitch in "Multiple Copies" mode where a portion of the Status message would sometimes be "hidden" underneath the progress bar.

What's New in version 1.5.1

- Compatibility with A/UX 3.0.

- Under System 7, you can now drop a floppy disk onto DART to create an image file.

- The default filename in Save dialogs is now filled in with the volume name of the source disk (if a source has been selected.)

- Volumes can now be mounted in the Finder when DART is running in the background.

- Fixed a bug which could occasionally cause a bus error on certain machines. The error would occur either immediately on launch, or after the about box was dismissed.

- Fixed a bug which could cause DART to refuse to format a blank 1.4M floppy disk (or a 1.4M floppy formatted as 800K) when "Format Disk" was checked.

Where To Locate DART

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates"
  Lists online services for "free" Apple software updates.

- "Obtaining Apple Product Support in the USA"
  Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech. Info. Library.

Article Change History:
23 Dec 1994 - Added Power Macintosh note.
27 Sep 1994 - Reviewed.
06 Oct 1993 - Updated with info on DART 1.5.3, and revised title.

KanjiTalk on a Performa 600 (3/93)

Revised: 3/18/93
Security: Everyone

KanjiTalk on a Performa 600 (3/93)

==========

Article Created: 18 March 1993

TOPIC ----------

Will KanjiTalk System 7.1 run on a Performa 600? What System Enabler should I use?

DISCUSSION ----------

KanjiTalk System 7.1 WASN'T tested with the Performa 600, so the configuration isn't supported. We believe, however, that KanjiTalk System 7.1 should work fine on the Performa 600 since it differs only slightly from the Macintosh IIvx (the Performa 600 doesn't have the 32K processor cache). If you want to try using this configuration, we suggest using the Install Me First disk for the Macintosh IIvi and IIvx (there are localized versions for KanjiTalk) and try the IIvx install first.

By the way, there's a different system enabler for the Performa 600, but it's only required if you're running the 7.1P version of system software. System Enabler 001 (on the Install Me First disk for the Macintosh IIvi and IIvx) should work on the Performa 600, but again, this hasn't been tested.

PowerBook 165c: Compatibility with Connectix PB Utilities (8/93)

Revised: 7/7/94
Security: Everyone

PowerBook 165c: Compatibility with Connectix PB Utilities (8/93)

==========

Article Created: 18 March 1993
Article Reviewed/Updated: 12 August 1993

TOPIC ----------

My PowerBook 165c is freezing at various times when Connectix PowerBook Utilities (CPU) version 1.0j is active. Is there a fix for this?

DISCUSSION ----------

Connectix PowerBook Utilities (CPU) 1.0j has some incompatibilities with the PowerBook 165c. These have been confirmed by Connectix tech support.

The CPU security feature will cause the PowerBook to freeze when the correct password is entered.

The LCD screen saver will cause crashes with bad F-line instructions.

CPU cannot properly manipulate the 165c's backlighting control. This does not cause any crashes.

In order to use CPU software with a PowerBook 165c, go into each saved configuration (all sets for each defined user) and turn the Screen Saver and Security features off individually.

These problems are remedied in Connectix PowerBook Utilities 2.0.

Call Connectix for the latest information and to obtain the current release of the software. To locate a vendor's address and phone numbers, use the vendor name as a search string.

Article Change History:
12 August 1993 - CPU version 2.0 is now available.

PowerBook Express Modem: Software Versions and Issues (12/94)

Revised: 12/15/94
Security: Everyone

PowerBook Express Modem: Software Versions and Issues (12/94)

==========

Article Created: 18 March 1993
Article Reviewed/Updated: 15 December 1994

TOPIC ----------

This article describes:

- Where to obtain the latest Express Modem software.
- The different versions of Express Modem software and what fixes each version implemented.
- Using Express Modem software with the PowerBook Fax/Data Modem.
- Express Modem software support issues.

DISCUSSION ----------

These articles can help you locate software updates mentioned here:

- "Where To Find Apple Software Updates"
  Lists online services for "free" Apple software updates.

- "Obtaining Apple Product Support in the USA"
  Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech. Info. Library.

Software Versions:

1.0 First release. Support for PowerBook Duo 210 and 230 only.
Includes Fax Sender 1.1

1.0.1 Added support for PowerBook 160 and 180.
- Includes System Enabler 111 (1.0.2).
- Improved compatibility with third party extensions.

1.0.2 European release only.

1.0.3 Italy release only.

1.0.4 Worldwide release. Includes Fax Sender 1.1.2

- Early versions of the software had trouble with connections requiring parity. (Typically host connections using 7 data bits.) Connections requiring parity are now fully supported in 1.0.4.
- Fixed ring detection problem.
- Added support for Loss of Carrier indication through the serial driver (SerSatus call, ctsHold byte).
- Fixed problem with XON/XOFF flow control during error corrected connections.
- Improved compatibility with US Robotics high speed modems when running LAP-M error correction.
- Problems involving Fax Terminal Pref file corruption have been addressed in 1.0.4. Symptoms customers would experience, would be seeing an "X" appear through the Fax extension upon startup and not being able to send a fax.
- When sending a fax, the six special dial characters (*,#,A,B,C,D) are now supported in the dial string.
- Fax Sender 1.1.2 now allows you to cancel sending a fax during imaging. Earlier versions only allowed cancellation after imaging was complete.

Problems not fixed in 1.0.4:

- Incompatibility with Prodigy software, where Prodigy does not recognize the Express Modem (currently under investigation).
- Problems have been reported using the "W" (wait for dial tone) and ":" (wait for calling card tone) dial commands. For example, calling card tones like Pacific Bell's and AT&T's are detected correctly, but not some others like MCI (currently under investigation). If you find that the tone is not being properly detected, you may need to enter one or more commas (,) to tell the modem to wait before sending the calling card number. Each comma represents a delay of 2 seconds.

1.1.2 Updated to include the Macintosh AV computers that now include the Express Modem option.

1.5.1

- Fixed the '@' dial modifier command so that it now works as described in the Express Modem user manual.
- Improved throughput and reliability. Fixed a problem where fallback from MNP to async could fail and the Express Modem would hang up.
- Removed dependency on A/ROSE. A/ROSE is no longer required.
- Changed the default factory profile of atN value from 0 to 1.
- Added support for GeoPort for Power Macintosh.

1.5.2

- Fixed a problem where Faxing caused hanging from time to time with EM 1.5/1.5.1
- V23 rework for France (Minitel was not working well)
- Fixed a problem where crashes appears at random in 1.5 and 1.5.1

during the fax process or the modem power-up sequence.

1.5.3 Was released to support Japanese System Software and systems.
- Fax blacklisting delay for Norway was too short and was corrected.
- Italy and Germany line detect button was not handled properly in EM 1.5.2.
- RAM Memory card > 12MBytes were conflicting with EM 1.5.2 this is now fixed.

1.5.4 The addition of the Fax Terminal 7.5 compatibility extension. The extension consists of delaying the Fax sending of documents which are in the "Fax Waiting To Be Sent" folder at start up time.

1.5.5
- Improvement for the PowerBook 500 series modem in Sweden and France. (Express Modem II only ships internationally. The Global Village Mercury ships in the U.S.)
- Corrected a HDLC issue on all configurations except on PowerBook 200 Series computers. This affected large file transfers in MNP/V.42 mode.

Using the Express Modem software with the PowerBook Fax/Data Modem
---
The Express Modem software includes Fax Sender 1.1.2. Fax Sender 1.1.2 is backward compatible with the PowerBook Fax/Data Modem.

Why would PowerBook Fax/Data modem users want to upgrade to the Express Modem version of Fax Sender?

- Fax Sender 1.0.1 and 1.0.3 had a problem where the Fax Page Length produced would be A4 (~12.5 inches) even though US Letter was selected. This was corrected in Fax Sender 1.1.

- Performance. Imaging of documents is faster.

- New Fax Quick Send feature.

When using Fax Sender 1.1.2 software on a PowerBook with a PowerBook Fax/Data Modem it is important to note that the Serial Tool extension is required. The Serial Tool is "left over" from any earlier Fax Sender 1.0.1 or 1.0.3 installation, or can be dragged into the Extensions folder manually if a 'clean' System Software & Express Modem software installation is performed.

Other Issues Involving the Express Modem

- When sending a fax it is impossible to image with a full disk. There is no workaround (rare problem). For example, sending a 14-page fax may require approximately 1MB of free disk space.

- ATL commands are not supported but will result in "OK" if used. Use the Sound Control Panel to set volume level of the speaker.

- AT&T (Self Tests) commands are documented in the "Express Modem AT Cmds" read me, but actually are not supported.

- The Express Modem was designed to work with the Communications Toolbox (CTB). The Express Modem Tool, a CTB Connection Tool, was designed to work specifically with the Express Modem. If you use an application that supports the CTB, it is preferable that you choose the Express Modem Tool, rather than selecting the Serial Tool, Apple Modem Tool, or disabling the CTB.

- The Express Modem provides compatibility for applications that do not support the CTB. Selecting "Internal Modem" in the PowerBook control panel enables applications using serial port A (External Modem Port) to communicate with the Express Modem.

- It is not necessary to explicitly turn on the modem through the Express Modem control panel. When an application attempts to use the Express Modem, the modem will automatically be turned on.

- When your computer is transmitting or receiving data or faxes, make sure that it does not go to sleep. You can select "Don't sleep when plugged in" from the Options dialog box in the PowerBook control panel.

- Fax Terminal is not set by default to receive faxes. You must first select the "Answer calls" check box in Fax Terminal Preferences in order to receive faxes automatically.

- If you have AppleTalk Remote Access installed, it is recommended that you remove the "Serial Port Arbitrator" extension from the Extensions folder inside the System Folder. AppleTalk Remote Access will still function properly. The extension just keeps track of the names of applications using serial ports for user notification.

- Applications that use a non-standard means of accessing a modem (for example, bypassing the serial driver and directly controlling the hardware, or implementing an alternate to the standard serial driver) will have no means of accessing and using the Express Modem.

- Fax Sender will turn a page in landscape mode to portrait mode before faxing. There is no work around.

Article Change History:
15 Dec 1994 - Added information on Express Modem version 1.5.4 and 1.5.5.
29 Sep 1994 - Added information on Express Modem version 1.5.2.
21 Sep 1994 - Updated to include Express Modem version 1.5.3.
16 Jun 1994 - Updated to include Express Modem version 1.5.1 and Fax Sender only faxes in portrait mode.

DAL Server for AS/400: Joining Tables In SQL Query (3/93)

Revised: 4/6/93
Security: Everyone

DAL Server for AS/400: Joining Tables In SQL Query (3/93)

==========

Article Created: 18 March 1993

TOPIC ----------

What is the number of tables that can be joined for a query using DAL Server for AS/400? I've heard of joining up to 32 tables for a query using other SQL methods, while the DAL server can join 2.

DISCUSSION ----------

The number of tables that can be joined in a SQL query is determined by the Database Management System (DBMS) -- NOT by DAL.

The SQL/400 Programmers' Guide and Reference Guide repeatedly mention "two or more tables being joined" -- without specifying an upper limit on the number of tables. We see no reason why you wouldn't be able to "join" 32 tables in one select statement.

DAL and Omnis 7: Using The Break Function (3/93)

Revised: 3/26/93
Security: Everyone

DAL and Omnis 7: Using The Break Function (3/93)

==========

Article Created: 18 March 1993

TOPIC ----------

When querying a table of 18,000 rows, the query returned 10,000 rows. I wanted to cancel the output, but DAL would not stop sending output until all rows had been sent, or until I restarted the computer.

I contacted Blyth about Omnis 7 and DAL, they said it was a problem with DAL. However I believe this is an Omnis 7 problem.

Is, or isn't, it possible to interrupt DAL while it is sending output?

This is the VTAM DAL server connected via an Avatar board.

I tried similar scenarios on an AS/400 DAL Server using Clear Access; output aborted successfully.

DISCUSSION ----------

- The lack of break in Omnis 7 is an Omnis problem.

- DAL supports the break function for the VAX, A/UX, TSO, VTAM and VM servers for AppleTalk, Async, TCP and 3270 protocol connections. The break is not supported for APPC connections to either VTAM or AS/400.

We have never had a copy of Omnis so we haven't been able to test with it. The Product Manager at Blyth told us that Omnis does not support DAL API calls directly. Therefore it would not support the break function, as that is a DAL API call.

As far as the break "working" in Clear Access to the AS/400:

- Clear Access does support the CLBreak API call: no problem there.

- The SNA•ps APPC network adapter does not support the actual interruption of the data being returned because of constraints in that network protocol.

The SAN•ps APPC network adapter most definitely will NOT support the termination of data from the server. We have done a lot of testing on this issue to the VTAM server and have also checked out this function to the AS/400 server. It does not work with either. The application handles the break request, but subsequent attempts to query the server have to wait for the data to be finished being sent from the first query.

The lack of break functionality in the SNA•ps APPC network adapter is not considered a "bug" by engineering, but rather a "constraint of the protocol". Therefore, DAL engineering is not planning to fix the APPC network adapter to support the break function at this time.

System Software: What Up your FCBs Does (3/93)

Revised: 3/22/93
Security: Everyone

System Software: What "Up your FCBs" Does (3/93)

==========

Article Created: 22 March 1993

TOPIC ----------

I have System 7 installed, and there's an extension licensed to Apple called "Up your FCBs." What is this, and is it necessary?

DISCUSSION ----------

A file control block (FCB) is used for any file that's open. If a file has both a data fork and a resource fork, it needs two file control blocks. The system needs a number of files open all the time. Examples of these are the System, the Finder, and the Desktop Database.

When you mount hard disks or floppy disks, they use three FCBs for their Desktop files and other needed information. When you mount an AppleShare volume, it uses one FCB. When you open a file from within an application, it depends on the application as to whether it will use an FCB. It needs to open the file to get the data out of it, but some applications (like AppleLink) close the file after reading the data, and no longer use that FCB.

Under system software 6.0.x, the number of FCBs the system could have open at one time was set in the boot blocks. The "Up your FCBs" INIT allowed you to modify this number in the boot blocks.

System 7 doesn't work this way. Under System 7, the number of free FCBs changes dynamically. When the system needs more FCBs, the number increases, and there's no need to change it in the boot blocks. The maximum number of FCBs, however, is 346.

The bottom line, then, is that under System 7, "Up your FCBs" isn't any benefit. Under system software 6.0.x, "Up your FCBs" is useful to increase the number of free FCBs because it doesn't happen

dynamically.

AppleSearch 1.0.1: Product Description (7/94)

Revised: 7/22/94
Security: Everyone

AppleSearch 1.0.1: Product Description (7/94)

==========

Article Created: 22 March 1993
Article Reviewed/Updated: 22 July 1994

TOPIC ----------

This article describes AppleSearch, the full-text search and retrieval software.

DISCUSSION ----------

AppleSearch offers a powerful yet easy way for Macintosh users to access information on a server by providing text search and retrieval. Client users can quickly find information on topics they specify or they can let AppleSearch act as a personal agent that periodically provides updated information.

AppleSearch provides electronic "Reporters" and newspaper-like updates as intuitive ways to obtain personalized information. A Reporter is a user-defined electronic search agent that looks for and retrieves the information requested. If a Reporter is set to make scheduled searches, it looks for new or recently modified documents relevant to the search request and automatically delivers the results—from the server to the user's computer—in an easy-to-read update.

Both beginners and expert users will benefit from a wide range of query features. Because AppleSearch processes natural language search queries, users can simply ask for information in their own words. They can also search for a particular phrase or for terms that occur frequently with a search query term. For users familiar with the Boolean query language, AppleSearch supports the full range of Boolean operators.

AppleSearch gives users transparent access to documents in various formats, including word-processing, page-layout, spreadsheets, and electronic-mail. XTND file format translators extract plain text from these document types so that AppleSearch clients can view the text regardless of the document's original format.

AppleSearch information sources are shared folders of documents (such as

correspondence, reports, or on-line newsfeeds) that reside on the server or a locally mounted volume.

The AppleSearch search engine automatically creates an index for each information source, which is used to find the best matches to user search requests. Using a one- to five-star rating system, results are automatically ranked in the order of their relevance to the request.

Benefits

Easy to use
- Allows search queries to be entered in the user's own words

Personalized information updates
- Formatted updates delivered to user's desktop on a daily or weekly basis

Easy-to-read, prioritized information
- Provides quick access to the most relevant document titles

Transparent access to source documents
- Displays text independently of the original application

Powerful full-featured search engine
- Processes natural language or Boolean queries

Easy to administer
- Provides automated indexing of information sources

Customizable
- Can be adapted to meet an organization's specific needs

AppleSearch 1.0.1: Product Details, System Requirements (7/94)

==========

Article Created: 22 March 1993
Article Reviewed/Updated: 22 July 1994

TOPIC ----------

This article contains AppleSearch product details, system requirements, and licensing and ordering information.

DISCUSSION ----------

AppleSearch Client

The Client software provides electronic Reporters and newspaper-like updates as an intuitive way to retrieve information when it is needed. You create an AppleSearch Reporter to search for information on a specific topic. The AppleSearch Reporter searches all selected information sources on the AppleSearch server for key words in a query, then quickly provides a list of documents that are relevant to the query ranked from one to five stars.

You can choose to view the text of each document, or you can retrieve the full document in its original format. AppleSearch can display the Reporter's results in an update created automatically, on a regular basis, and delivered to a specified location on a hard disk. The Reporters can be saved to use again or to share with colleagues.

AppleSearch Server

The Server software has a feature-rich search engine from Personal Library Software that processes the queries of AppleSearch client users. For each information source, AppleSearch maintains an index of all potential query terms in the document and their relationship to each other. You can index an information source immediately or schedule incremental indexing so that users always have access to the latest information. The Server software maintains a list of all Reporter names, organized by user ID. Once created, Reporters reside on the server and their users can access and use them over a local network or remotely by using Apple Remote Access.

Product Details

Setup and Configuration

- AppleSearch is quick and easy to install. You simply double-click the Installer icon on your Setup disk for both the Client and the Server.
- Supports up to 50 users.

Information Sources

- Any shared folder on an AppleSearch server volume.
- Users can make information available to be searched and retrieved by dragging document files into shared folders on the server.
- Can reside on any locally mounted volume such as a hard drive or CD-ROM.

Indexing

- For each AppleSearch information source, AppleSearch indexes all documents and creates an index file of query terms.
- Indexes information sources at 10–30 megabytes/hour (depending on the type of computer used for the server and the file format of the documents).
- The network administrator can schedule incremental indexing to occur automatically at hourly, daily, or weekly intervals. Portions of an index will be updated when documents are modified in the corresponding info source.
- Performs automatic compacting to reorganize the index and release unused disk space.
- Typically requires the same amount of disk space as the text of the content itself.
- A CD-ROM can be made AppleSearch-ready simply by pre-indexing its content.

Document Independence

Apple's XTND file format translator technology in conjunction with MacLinkPlus/AppleSearch, from DataViz, Inc., is used for AppleSearch indexing, searching and retrieving. It allows AppleSearch users to view the text of nearly all document types without using the application that created it.

The following translators are included with AppleSearch server software: MacWrite versions 4.5, 5.0, and II; Microsoft Word for Macintosh version 3.0, 4.0, 5.0, and 5.1; Microsoft Works (word processing) versions 2.0 and 3.0; FrameMaker MIF versions 2.0 and 3.0; PageMaker version 4.0; Ragtime version 3.1; Apple Works; WriteNow versions 2.0 and 3.0; Nisus version 3.0; and PICT. Additional translators are available from third-party developers.

Reporters and Updates

- Reporters contain search criteria defined by the user; once saved, they reside on the server and can be scheduled to periodically search and retrieve information relevant to the search request.
- Results found by a scheduled reporter are automatically formatted in an easy-to-read update and delivered to users on the days and times they specify.

- The Import/Export Reporter feature allows users to share Reporters.

Security

- Provides password logon to the server.
- Manages search requests based on the user access privileges associated with the security features of AppleShare or Macintosh System 7 file sharing.
- Allows guest users to conduct on-demand searching.

Query Features

- Natural language processing—allows users to process queries in their own words and get effective results.
- Relevancy ranking—assigns a ranking to each document according to its relevance to the search query.
- Co-occurring words—displays words that frequently co-occur with a query term.
- Stemming—searches for variations of the root query term.
- Proximity—searches for words within a certain number of words.
- Phrase searching—searches for two or more words next to each other.
- Wild string—searches for part of the search term.
- Boolean operators (and, or, not) supported.

AppleSearch Client Developer's Kit

The Client Developer's Kit is for developers who want to write custom client interfaces to the AppleSearch server or integrate AppleSearch functionality with other applications. The API comes in C Library and Apple events versions. The kit includes several header and object files, developer documentation, and a sample application with source code. With this kit you also get the AppleSearch Update File Format Developer's Kit, which includes utility routines

System Requirements

AppleSearch Server

To set up an AppleSearch server, you need:

- An Apple Macintosh computer with a 68040 microprocessor, a Power Macintosh computer, or a Workgroup Server
- At least 8 megabytes (MB) of RAM (for use with Macintosh system software version 7.0 or later, or with AppleShare 3 software); 12MB of RAM (for use with AppleShare 4 software); or 16MB of RAM (for use with AppleShare Pro software)
- An Apple SuperDrive floppy disk drive
- An internal hard disk with available storage space equivalent to two-and-a-half times the space required for textual content of the source being indexed
- AppleSearch Server software and the AppleSearch Update File Format Reference, needed to write software that can read and write AppleSearch-compatible updates.

AppleSearch Client

To set up an AppleSearch client, you need:

- Any Macintosh computer with an internal hard disk and at least 4MB of memory

- Macintosh system software version 7.0 or later
- An Apple SuperDrive floppy disk drive
- A hard disk drive
- AppleSearch Client software

Network Requirements

To set up a network with AppleSearch you need:

- AppleShare or the Macintosh file-sharing feature (AppleShare can be purchased to provide a higher performance configuration that allows a larger number of users. AppleSearch is compatible with AppleShare 3, 4, and Pro.)
- AppleTalk software and an AppleTalk network connection (LocalTalk, EtherTalk, TokenTalk, or Apple Remote Access)

Licensing and Ordering Information

AppleSearch Server/Client 5-Pack
Order No. M2136Z/B

With your order, you receive:

- AppleSearch Server software
- The AppleSearch Administrator's Guide
- AppleSearch Client software
- 5 copies of the AppleSearch User's Guide
- User license to make up to 5 copies of the AppleShare Client software

AppleSearch Client 10-Pack
Order No. M1588Z/A

With your order, you receive:

- AppleSearch Client software
- 10 copies of the AppleSearch User's Guide
- User license to make up to 10 copies of the AppleShare Client software

Apple Workgroup Server 60: Description (10/93) (Discontinued)

==========

Article Created: 22 March 1993
Article Reviewed/Updated: 21 October 1993

TOPIC ----------

This article describes the Apple Workgroup Server 60.

DISCUSSION ----------

The Apple Workgroup Server 60 provides the performance, reliability, and manageability you need to meet small and medium workgroup requirements for file and print server applications. The most affordable of Apple's server family, this system is based on the 20-megahertz Motorola 68040 microprocessor. With on-board Ethernet and built-in AppleTalk networking capability, this product is ideal for the needs of up to 20 users (that is, users simultaneously reading from and writing to the server).

The Apple Workgroup Server 60 gives you flexibility and choice. You can choose a 230MB or 500MB internal hard disk, add an internal CD-ROM drive, and install a NuBus or processor-direct slot card. A high-speed SCSI interface lets you add peripherals, such as hard disks and other high-capacity storage devices.

The Apple Workgroup Server 60 continues the "plug and play" tradition established by the Macintosh. System 7 and high-performance AppleShare 4.0 file and print server software is preloaded, so all you do is attach your monitor, keyboard, power cables, and network connection -- and in minutes the server is available to users. Because it's a snap to maintain, manage, and reconfigure, over the long run the Apple Workgroup Server 60 offers the lowest cost of ownership in its class.

To provide an entry-level file and print server solution for your small business, classroom, or similar environment, build your solutions around the Apple Workgroup Server 60.

Workgroup Server 60 Features

Power and speed
• 25 MHz 68040 microprocessor with FPU; 32-bit data bus

Memory
• 8MB RAM, expandable to 68MB

Display
• Works with all Apple displays
• 256 colors, expandable to 32,768

Expansion
• Eight built-in ports for peripherals
• Slot for additional expansion card
• Optional internal CD-ROM drive

Usability
• Easy to set up, learn, use, and extend

System software
• System 7 operating system
• AppleShare 4.0 file and print server software

Networking
• Built-in AppleTalk networking capability
• On-board Ethernet capability

Compatibility
• Reads Macintosh, MS-DOS, OS/2, and ProDOS floppy-disk formats

Apple Workgroup Server 60: Specifications

==========

Article Created: 22 March 1993
Article Reviewed/Updated: 21 October 1993

TOPIC ----------

This article provides technical specifications for the Apple Workgroup Server 60.

DISCUSSION ----------

Microprocessor

- MC68040, running at 25 MHz clock speed; 32-bit data bus; with a floating-point unit (FPU)
- Integral Paged Memory Management Unit (PMMU) and 8K cache architecture

Memory

- 8MB RAM, expandable to 68MB by adding SIMMs to two 72-pin slots

Storage

- One built-in Apple SuperDrive 1.4MB floppy disk drive
- One internal 230MB or 500MB hard disk
- Accommodates one 5.25-in. half-height device, such as the AppleCD 300i internal CD-ROM drive

Video Display

- Supports all Apple displays
- Works with a wide range of third-party displays, including some 19-inch, VGA, SVGA, NTSC, and PAL monitors

Video RAM (VRAM)

- Can support up to 1024K

- 512K standard supports:
  - 32,768 colors on the Macintosh 12" RGB Display
  - 256 colors on the AppleColor High-Resolution RGB Display (13"), Macintosh Color Display (14"), and Macintosh 16-inch Color Display
  - 256 shades of gray on the Macintosh 12" Monochrome Display
  - 16 shades of gray on the Macintosh Portrait Display (15")
  - 16 colors on the Macintosh 21" Color Display

Interfaces

- Internal expansion slot for one processor-direct or 7-inch NuBus expansion card (requires adapter)
- SCSI interface for connecting up to six external peripheral devices
- AAUI Ethernet connector
- Two serial (RS-232 or RS-422) ports
- One video port for color and monochrome displays of various sizes and resolutions
- One sound-output port (stereo) for external amplifier or headphones, and CD play-through
- One sound-input port for monaural sound input
- Two Apple Desktop Bus (ADB) ports for a keyboard, mouse, and other devices

Sound Generator

- Custom integrated circuit drives a stereo miniature headphone jack (22 kHz sample rate)

Keyboard and Mouse

- Several ADB keyboards with numeric keypads available
- Apple Desktop Bus Mouse II

Clock/Calendar

- Custom integrated circuit with long-life lithium battery

Disability Access

- CloseView, Easy Access, and visible-beep software are built in. These and third-party options provide alternative input and output devices

Power Requirements

- Line voltage: 100 to 240 V AC, RMS single phase, automatically configured
- Frequency: 47 to 63 Hz
- Power: 86 W maximum, not including display power

ADB Power Requirements

- Maximum current draw for all ADB devices: 500 mA (recommended maximum of three ADB devices)

- Mouse draws 10 mA
- Keyboard draws 25 to 80 mA, depending on the model used

Size and Weight

Main Unit:
- Height: 3.4 in. (8.5 cm)
- Width: 16.3 in. (41.5 cm)
- Depth: 15.6 in. (39.7 cm)
- Weight: 14.0 lbs (6.4 kg) varies with internal devices installed

Mouse
- Height: 1.3 in. (3.3 cm)
- Width: 2.4 in. (6.2 cm)
- Depth: 4.2 in. (10.7 cm)
- Weight: 4.0 oz. (0.10 kg)

Operating Environment

- Operating temperature: 50° to 104° F (10° to 40° C)
- Storage temperature: –40° to 116.6° F (–40° to 47° C)
- Relative humidity: 5% to 95% noncondensing
- Maximum altitude: 10,000 ft. (3,048 m)

Ordering Information

Apple Workgroup Server 60 8/230
- Apple Workgroup Server 60 computer with 8MB of RAM, built-in 1.4MB Apple SuperDrive, and internal 230MB hard disk drive
- Mouse
- System software, AppleShare 4.0 file and print server software, and Apple documentation viewer preloaded on hard drive
- AppleShare file and print server software and installer software
- Complete on-line and hard-copy documentation
- Limited warranty statement

Other configurations
- Internal 500MB hard disk
- Internal AppleCD 300i CD-ROM drive

NuBus Adapter
Order No. M1402LL/A
- Macintosh Centris 610 NuBus Adapter (fully compatible with the Apple Workgroup Server 60)
- Limited warranty statement

Security: Everyone

Apple Workgroup Server 80: Description (3/93) (Discontinued)

==========

Article Created: 22 March 1993

TOPIC ----------

This article describes the Apple Workgroup Server 80.

DISCUSSION ----------

The Apple Workgroup Server 80 provides the performance, reliability, scalability, and manageability you need to meet the requirements of medium-sized workgroups for file and print, workgroup database, or communications services. Representing the midrange of Apple's server family, this system is based on the fast 33-megahertz Motorola 68040 microprocessor. With on-board Ethernet and built-in AppleTalk networking capability, the Apple Workgroup Server 80 is ideal for up to 30 active users (that is, users simultaneously reading from and writing to the server). It can act as a communications server by running applications such as Apple's SNA•ps, MacX25, or MacX.400 gateway products, or the Apple Internet Router.

The Apple Workgroup Server 80 is expandable. You can add up to 136MB of RAM, install up to three NuBus cards, and store up to three additional high-capacity internal storage devices, such as an internal DDS-DC 4mm tape drive for backups.

Apple servers continue the "plug and play" tradition established by the Macintosh. System 7 and high-performance AppleShare 4.0 file and print server software is preloaded, so installation takes just minutes. Because it's a snap to maintain, manage, reconfigure, and expand, over the long run the Apple Workgroup Server 80 offers the lowest cost of ownership in its class.

To provide a midrange file and print server solution for your business, to supply classroom-to-campus integration, or to meet other communications

requirements, build your solutions around the Apple Workgroup Server 80.

Power and speed
• 33 MHz 68040 processor
• Integrated 33 MHz math coprocessor
• 8K integrated cache

Memory
• 8MB RAM, expandable to 136MB

Display
• Works with all Apple displays

Expansion
• Room for three internal storage devices, such as the AppleCD 300i internal CD-ROM drive and internal DDS-DC 4mm tape drive
• Three NuBus expansion slots
• One inline 68040 processor-direct slot

Usability
• Easy to set up, learn, use, and extend

System software
• System 7 operating system
• AppleShare 4.0 file and print server software

Networking
• Built-in AppleTalk networking
• On-board Ethernet

Compatibility
• Reads Macintosh, MS-DOS, OS/2, and ProDOS floppy disk formats

Apple Workgroup Server 80: Specifications (3/93) (Discontinued)

==========

Article Created: 22 March 1993

TOPIC ----------

This article provides specifications for the Apple Workgroup Server 80.

DISCUSSION ----------

Microprocessor

- MC68040, running at 33 MHz clock speed
- Integrated 33 MHz floating-point unit (FPU)
- Integral Paged Memory Management Unit (PMMU) and 8K cache architecture

Memory

- 8MB RAM on the logic board
- Four industry-standard 72-pin Single Inline Memory Module (SIMM) sockets allow expansion to 136MB
- Includes RAM disk software

Storage

- One built-in Apple SuperDrive 1.4MB floppy-disk drive
- Accommodates one full-height, 3.5-inch hard disk drive and one removable 3.5-inch device, such as an internal DDS-DC tape drive
- Accommodates one 5.25-inch, half-height device such as the AppleCD 300i internal CD-ROM drive

Video Display

- Supports all Apple displays
- Works with a wide range of third party displays, including some 19-inch, VGA, SVGA, NTSC, and PAL monitors

Interfaces

- Three internal NuBus 12-inch expansion slots
- One 68040 processor-direct slot
- SCSI interface for connecting up to six external devices
- AAUI Ethernet connector
- Two serial (RS-232/RS-422) ports, 230.4 Kbit/sec maximum (up to 0.920 Mbit/sec if clocked externally)
- One video port for color and monochrome displays of various sizes and resolutions
- One sound-output port for stereo playback from CDs and stereo playback of Macintosh sound
- One monaural sound-input port
- Two Apple Desktop Bus (ADB) ports for a keyboard, mouse, and other devices

Video RAM (VRAM)

- Can support up to 1024K
- 512K standard supports:
  - 32,768 colors on the Macintosh 12" RGB Display
  - 256 colors on the AppleColor High-Resolution RGB Display (13"), Macintosh Color Display (14"), and Macintosh 16" Color Display
  - 256 shades of gray on the Macintosh 12" Monochrome Display
  - 16 shades of gray on the Macintosh Portrait Display (15")
  - 16 colors on the Macintosh 21" Color Display

Sound Generator

- Custom integrated circuit drives a stereo miniature headphone jack (22 kHz sample rate)

Keyboard and Mouse

- Several different ADB keyboards are available
- Apple Desktop Bus Mouse II

Clock/Calendar

- Custom integrated circuit with long-life lithium battery

Disability Access

- CloseView, Easy Access, and visible-beep software are built in. These and third-party options provide alternative input and output devices.

Power Requirements

- Line voltage: 100 to 240 V AC, RMS, automatically configured
- Frequency: 50 to 60 Hz, single phase
- Power: 200 W maximum, not including display power

ADB Power Requirements

- Maximum current draw for all ADB devices: 500 mA (recommended maximum of three ADB devices)
- Mouse draws 10 mA
- Keyboard draws 25 to 80 mA, depending on the model used

Size and Weight

Main unit:
- Height: 14.25 in. (30.6 cm)
- Width: 8.9 in. (19.6 cm)
- Depth: 16.0 in. (39.6 cm)
- Weight: 25.3 lb. (11.5 kg) varies with internal devices installed

Mouse:
- Height: 1.3 in. (3.3 cm)
- Width: 2.4 in. (6.2 cm)
- Depth: 4.2 in. (10.7 cm)
- Weight: 4.0 oz. (0.10 kg)

Operating Environment

- Operating temperature: 50° to 104° F (10° to 40° C)
- Storage temperature: -40° to 116.6° F (-40° to 47° C)
- Relative humidity: 5% to 95% noncondensing
- Maximum altitude: 10,000 ft. (3,048 m)

Ordering Information

Apple Workgroup Server 80 8/500/DDS-DC
- Apple Workgroup Server 80 computer with 8MB of RAM, built-in 1.4MB Apple SuperDrive, 500MB internal hard disk drive, and an internal digital data storage-data compression (DDS-DC) 4 mm tape drive
- Mouse
- System software, AppleShare 4.0 file and print server software, and Apple documentation viewer preloaded on hard drive
- AppleShare 4.0 file and print server software
- Complete on-line and hard-copy documentation
- Limited warranty statement

Other configurations
- 16MB RAM
- 1000MB (1GB) internal hard disk
- Internal AppleCD 300i CD-ROM drive

Apple Workgroup Server 95: Specifications (3/93) (Discontinued)

Revised: 6/2/94
Security: Everyone

Apple Workgroup Server 95: Specifications (3/93) (Discontinued)

==========

Article Created: 22 March 1993
Article Revised/Updated: 17 February 1994

TOPIC -----

This article provides specifications for the Apple Workgroup Server 95.

DISCUSSION -----

Microprocessor

- Motorola 68040, 32-bit architecture, running at 33 MHz clock speed
- Integral Paged Memory Management Unit (PMMU), Floating Point Unit (FPU), and 8K-cache architecture

Memory

- Entry system comes with 16MB of parity RAM standard
- 16 Single In-line Memory Module (SIMM) sockets, allowing expansion to 256MB of RAM with 16MB SIMMs. Must replace all 4MB RAM SIMMs with 16MB SIMMs to reach 256MB
- 128K second-level 68040 memory cache on board, expandable to 512K

Operating System

- Version of multitasking, industry-standard UNIX operating system
- Performance-tuned for file and database services (including asynchronous I/O and SCSI DMA driver support)

Mass Storage Devices

- Built-in Apple SuperDrive 1.4MB floppy-disk drive
- Accommodates five 3.5" half-height SCSI hard drives for a total of 10GB of internal storage and one CD-ROM or DDS-DC 4mm tape drive
- DDS-DC 4mm tape drive uses the Media Recognition System (MRS) and can back up 4 to 6 GB of compressed data (dependent on data being compressed) on

90-meter tapes.

Interfaces

- One Apple Desktop Bus (ADB) port, supporting a keyboard, mouse, and other devices daisy-chained through a synchronous serial bus
- Two serial (RS-232 or RS-422) ports, 230.4 Kbit/sec. maximum (up to 0.920 Mbit/sec if clocked externally)
- Two SCSI DMA channels, four SCSI bus interfaces total
- All SCSI channels support disconnect/reconnect SCSI feature
- The two SCSI DMA channels support active termination and active negation
- Five internal NuBus expansion slots (one used by PDS card)
- Sound-input port for monaural sound input
- Dual mono line input ports
- AAUI Ethernet connector

Security

- Electronic key lock

Video Display

- Can support up to 2MB VRAM
- 1MB VRAM standard supports
  - 32,768 colors on the Macintosh 12-inch RGB Display
  - 256 colors on the AppleColor High-Resolution RGB Display (13"), Macintosh Color Display (14"), and Macintosh 16" Color Display
  - 256 shades of gray on the Macintosh Portrait Display (15")
  - 16 colors on the Macintosh 21" Color Display
- Supports all Apple monitors
- Supports a wide range of non-Apple monitors, including some 19” VGA, SVGA, NTSC, and PAL

Keyboard and Mouse

- Supports all Apple Desktop Bus keyboards
- Apple Desktop Bus Mouse II

Clock/Calendar

- Custom chip with long-life lithium battery

Electrical Requirements

- Line voltage: 100 to 240 V AC, RMS automatically configured
- Frequency: 50 to 60 Hz, single phase
- Power: 303 W maximum, not including display power

ADB Power Requirements

- Maximum current draw for all ADB devices: 500 mA (recommended maximum of three ADB devices)

- Mouse draws 80 mA
- Keyboard draws 25 to 80 mA, depending on the keyboard model used

Operating Environment

- Operating temperature for a configuration with five 2GB hard drives: 50° to 95° F (10° to 35° C)
- Operating temperature for all other environments: 50° to 104° F (10° to 40° C)
- Storage temperature: –40° to 116.6° F (–40° to 47° C)
- Relative humidity: 20% to 80% noncondensing
- Maximum altitude: 10,000 ft. (3,048 m)

Size and Weight

Main unit:

- Height: 18.6 in. (47.3 cm)
- Width: 8.9 in. (22.4 cm)
- Depth: 20.6 in. (52.3 cm)
- Weight: 36 lb. 12 oz. (16.7 kg)*

  * Weight will be greater with internal hard disks and additional internal storage devices.

Mouse:

- Height: 1.3 in. (3.3 cm)
- Width: 2.4 in. (6.2 cm)
- Depth: 4.2 in. (10.7 cm)
- Weight: 4.0 oz. (0.10 kg)

DAL for Sybase on OS/2 (3/93)

Revised: 4/6/93
Security: Everyone

DAL for Sybase on OS/2 (3/93)

==========

Article Created: 19 March 1993

TOPIC ----------

I'm interested in accessing Sybase on OS/2 via DAL. Is a DAL server available? If not, would I be able to access Sybase using GQL or DataPrism on a Macintosh using Sybase's Open Client.

DISCUSSION ----------

DAL does not have a server that runs on the OS/2 platform.

However, both GQL and DataPrism support access to the Sybase Open Client product, which operates as a server on OS/2.

For GQL, this server is referred to as "DB Library" rather than Sybase Open Client in the connection selection window.

For DataPrism, release 1.8 or higher is required and then the Sybase Open Client is supported as a server connection selection.

PowerBook or Standard Keyboards: Using Easy Access (9/94)

Revised: 9/26/94
Security: Everyone

PowerBook or Standard Keyboards: Using Easy Access (9/94)

==========

Article Created: 23 March 1993
Article Reviewed/Updated: 26 September 1994

TOPIC ----------

How can I activate Easy Access on a PowerBook without going through the Control Panel? The keyboard sequence Shift+Command+Clear doesn't work on the PowerBook since there's no Clear key. The Easy Access control panel also doesn't work on Macintosh computers with standard keyboards.

This would help when the mouse is failing or disabled.

DISCUSSION ----------

We're assuming that you want to enable the Mouse Keys function of Easy Access. Basically, PowerBooks don't support Mouse Keys since they don't have a numeric keypad. Even if you enable Mouse Keys through the Control Panel, you'd need a keypad to move the pointer. We don't have a keypad to try this, but it should work.

When the mouse is inoperable, you might use the Sticky Keys portion of Easy Access. Press the Shift key five times to enable or disable Sticky Keys. For further information on how to use Easy Access on the PowerBooks, look on page 141 of the user's manual: "Macintosh User's Guide for Macintosh PowerBook Computers."

Also, there's an INIT called "MouseKeys" that will allow the PowerBook and computers with standard keyboards to access the functionality of Easy Access. This is unsupported free software from Apple.

LW IIf, IIg, Pro: Switch to HP Emul via Parallel Port (4/93)

Revised: 4/26/93
Security: Everyone

LW IIf, IIg, Pro: Switch to HP Emul via Parallel Port (4/93)

==========

Article Created: 7 April 1993

TOPIC ----------

I've directly connected a LaserWriter Pro to the parallel port of an MS-DOS compatible computer. How can I temporarily switch from PostScript mode to HP emulation mode so I can print jobs encoded in HP's Printer Control Language (PCL)?

DISCUSSION ----------

If you've connected a LaserWriter IIf, IIg, or Pro to the parallel port of an MS-DOS compatible, the following information will allow you to switch your LaserWriter Pro from PostScript to HP LaserJet IIP emulation mode for the duration of the current job. The steps below must precede each print job that uses HP emulation.

Follow these steps:

1) Set the LaserWriter Pro communications thumbwheel switch to position 9; this will configure the parallel port for PostScript using Binary Serial Protocol (BSP). Note that the switch settings are listed on page 125 and 126 of the LaserWriter Pro User's Guide.

2) Embed the following line, which is case sensitive, into your PostScript code. This line will set the printer into HP emulation mode:

   currentfile /LaserJetIIP statusdict /emulate get exec

3) You must put a CTRL-D character (End of File or EOF) at the end of the PostScript file. Here is a simple BASIC program which will create a file "CTRL-D.TXT" that contains the CTRL-D character.

   10 OPEN "CTRL-D.TXT" FOR OUTPUT AS #1

```
20 PRINT #1, CHR$(04)
30 CLOSE #1
```

4) Use the MS-DOS COPY command to attach the CTRL-D to the PostScript file. If your PostScript code resides in a file named "PSFILE.TXT", the following command will attach the CTRL-D character and create a new file named "NEWFILE.TXT". For example:

```
COPY PSFILE.TXT+CTRL-D.TXT NEWFILE.TXT
```

5) Send the PostScript file to the parallel port (LPT1:) of the LaserWriter with this command:

```
COPY NEWFILE.TXT LPT1:
```

At Ease: Rebuilding the Desktop (7/96)

Revised: 7/30/96
Security: Everyone

At Ease: Rebuilding the Desktop (7/96)

==========

Article Created: 23 March 1993
Article Reviewed/Updated: 22 February 1995

TOPIC ----------

The article describes how to rebuild the desktop when At Ease is installed.

DISCUSSION ----------

If you are running At Ease and have it turned on, the desktop file will not rebuild.

System 7.5 Users

Here is how to rebuild the desktop file:

Step 1:
Turn At Ease off

Step 2:
Restart

Step 3:
Hold down the Space Bar to bring up the Extensions Manager control panel

Step 4:
Turn off all the extensions EXCEPT Macintosh Easy Open

Step 5:
Close Extensions Manager

Step 6:
Hold the Option-Command keys.

Step 7:
After rebuilding the desktop, open the Extensions Manager and turn the

extensions back on.

Step 8:
Turn At Ease back on.

Step 9:
Restart

Non-System 7.5 Users

Here is how to rebuild the desktop file:

Step 1:
Turn At Ease off.

Step 2:
Restart holding down the Shift key to turn extensions off.

Step 3:
After you see the extensions off message, hold down the Option-Command keys to rebuild the desktop.

Another method of rebuilding the desktop requires the At Ease user to have Finder access.

Step 1:
Sign into that user.

Step 2:
Hold down the Option-Command keys (continue holding these keys down).

Step 3:
Select "Go To Finder" from the Options menu.

The recommended way to rebuild the desktop is with all Extensions OFF (especially when running virus protection software). Most of the time, holding down Option-Command keys on restart is sufficient.

Article Change History:

Shared Device Names Not Available in the Chooser (3/93)

Revised: 4/6/93
Security: Everyone

Shared Device Names Not Available in the Chooser (3/93)

==========

Article Created: 19 March 1993

TOPIC -----

After installing System Software 7.1, shared device names, such as LaserWriters or File Servers, do not appear in the Chooser when their device icons are selected. AppleTalk is active in the Chooser. The network connections have been verified. I selected the Network control panel and no resources are selected. When any of the network resources in the Network control panel (LocalTalk, EtherTalk, TokenTalk) is selected, I get the error "The correct version of AppleTalk is not installed. Please reinstall the Network software". Reinstalling the network software does not resolve the problem.

DISCUSSION -----

If no resources are selected in the Network control panel, this is a possible sign of corruption for the network settings in Parameter RAM (PRAM). If AppleTalk is active in the Chooser, one of the network resource should always be selected in the Network Control Panel.

To resolve this issue you must zap the Parameter RAM. To zap PRAM under System 7.x, restart the Macintosh while holding down Command-Option-P-R. Keep the keys held down until you hear the startup chime a second time. This resets the Parameter RAM of the Macintosh.

Select the proper network resource device in the Network control panel. Make sure the shared device names appear in the Chooser.

You must also re-enter the setting changes you may have made to other control panels (Keyboard, Mouse, Sound, and so on). When you zap PRAM, it is reset to default values.

Macintosh IIsi: How to Avoid Memory Fragmentation (8/95)

Revised: 8/15/95
Security: Everyone

Macintosh IIsi: How to Avoid Memory Fragmentation (8/95)

==========

Article Created: 9 March 1993
Article Reviewed/Updated: 15 August 1995

TOPIC ----------

My Macintosh gives me incorrect reports about how much memory I have available. I have a Macintosh IIsi with 5MB of RAM. I'm using system software version 7.0.1, and Microsoft Word 5.0 with the memory allocation reduced to 1MB.

When I choose "About This Macintosh," it tells me that system software uses 2MB and Word uses about 1MB. It seems that I should have about 2 megabytes left, but it says I have only 800K.

DISCUSSION ----------

When you choose "About This Macintosh", it tells you the largest unused block of memory, not the total amount of unused memory. This fragmentation of memory occurs often, if you don't quit applications and desk accessories in exactly the reverse order in which you launched them each and every time. Your computer may have several unused blocks of memory mixed in with the used blocks of memory.

Order of Application Launches and Quits

To fix a situation where you have fragmented memory, you can either:

• Quit all open applications and desk accessories, and then open them again, or
• Restart your computer.

In order to avoid fragmentation again, be careful in planning the order in which you open and quit programs:

1) Open first the applications and desk accessories you're least likely to quit.

2) Open last those applications and desk accessories you're most likely to quit

during a work session.

When you need more memory, quit the application or desk accessories you opened most recently. By opening and closing applications and desk accessories this way, you free up a contiguous portion of memory. When you quit programs in random order, you're likely to have fragmented memory.

The Role of System 7 Tune-Up

The System 7 Tune-Up 1.1.1, improves handling of low-memory situations. System 7 Tune-Up 1.1.1 has some bug fixes and other benefits that improve both System 7.0 and 7.0.1. However, it can lead to memory fragmentation by encouraging you to let the Finder decide which programs to quit when you need more memory.

With Tune-Up installed in your system software, it considers only whether an application has windows open, and not the order you launched them. It first closes applications with no windows open. This means it could actually quit a 2000K program to open a 1800K program, thus creating a 200K fragment in memory. Since the Finder asks if it's okay to quit a program in a low-memory situation, you can choose not to.

Reducing Reserved Memory for Built-in Video

Use the Monitors control panel to reduce the amount of memory a Macintosh reserves for built-in video. To do this, hold down the Option key while clicking the Option button in the Monitors control panel. This brings up a special dialog box where you can set the maximum number of colors or grays to 256, 16, 4 or black and white. Restart your computer for memory changes to take effect. Here's a table that tells you how much memory you reserve for each selection:

Begin_Table

Colors or Grays	Memory Reserved for Built-in Video
256	350K
16	190K
4	126K
Black & White	94K

End_Table

32-Bit System Enabler: DayStar Compatibility (3/93)

Revised: 3/23/93
Security: Everyone

32-Bit System Enabler: DayStar Compatibility (3/93)

==========

Article Created: 23 March 1993

TOPIC ----------

I installed the 32-Bit System Enabler on a Macintosh IIcx with a DayStar accelerator. When I restart and check the Memory control panel, 32-Bit addressing is turned on. But when I select "About This Macintosh..." the system software is taking all memory above 8MB just as it does when 24-Bit addressing is used.

DISCUSSION ----------

DayStar Digital Technical Support indicates that both the PowerCard series and PowerCache series products work properly with the 32-Bit System Enabler. They did indicate that in one instance during testing they had to reset the PRAM before the 32-Bit System Enabler would work with a PowerCache card.

Please contact DayStar Digital directly. DayStar Digital Technical Support is searching for configuration information that would allow them to reproduce the problem.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

LaserWriter Pro: Configuring Paper Trays (4/93)

Revised: 4/23/93
Security: Everyone

LaserWriter Pro: Configuring Paper Trays (4/93)

==========

Article Created: 20 April 1993

TOPIC ----------

This article discusses paper handling on the LaserWriter Pro printer series.

DISCUSSION ----------

Paper Input Sources

The LaserWriter Pro allows for up to four paper input sources attached to the printer at any one time. These input sources include:

- Multipurpose tray
- 75-Envelope tray
- 250 Sheet-Feeder tray
- 500 Sheet-Feeder tray

The 250 Sheet-Feeder comes standard with the printer. This is also the default paper tray.

Setting Up The Driver

Use the LaserWriter Pro Installation diskette to install the driver on your Macintosh. You must use the 7.2 driver to take advantage of Multi-bin printing.

Once the additional options (trays) have been installed on the printer the driver must be prepped to see the additional input sources. The procedure for setting up the driver is:

1) Choose the Chooser from the Apple menu.
2) Select the LaserWriter icon.

3) Select a LaserWriter Pro printer for printing.
4) Click Setup. This will prep the LaserWriter driver for all input sources installed.

NOTE: The Setup button in the Chooser is located next to the background printing radio button. The button will either read Setup (if you are setting up the printer for the first time) or Review.

Tray Switching

The Tray Switching option allows you to control what happens when a multiple-bin printer (such as the LaserWriter Pro 600 or 630 with the optional second tray installed) runs out of paper during a print job. You can set the printer to continue printing from the next available paper tray, or to stop printing and return an Out of Paper message when the tray being used runs out of paper during a print job.

With tray switching turned on, the LaserWriter Pro 600 and 630 printers can print up to 350 pages at a time using the 250 sheet cassette and the 100 sheet multipurpose tray. With the optional 500 sheet feeder installed, tray switching works only between the 250 sheet cassette and the 500 sheet feeder. This allows printing of up to 750 pages at one time.

The output tray holds a maximum of 250 sheets. You must empty it if you have a print run greater than 250 pages. The paper output tray can be emptied on-the-fly without stopping the printer.

When using the 7.2 driver you have the option of printing from any of the four paper input sources; however there is some limitation with the bin selection. The LaserWriter driver version 7.2 gives you the option of printing the first page from any of the four input sources and then the remaining portion of the document must be printed from one and only one of the four input sources. The limitation is that the user may choose to print the first page from one input tray and the remaining portion of the document must be printed from one and only one of the paper input sources.

See the LaserWriter Pro User's Guide under "Printing documents" for more information on printing options.

AppleShare & System 7.x.x: Removing a Corrupt PDS File (7/96)

Revised: 7/26/96
Security: Everyone

AppleShare & System 7.x.x: Removing a Corrupt PDS File (7/96)

==========

Article Created: 22 March 1993
Article Reviewed/Updated: 26 July 1996

TOPIC ----------

How do I remove a corrupt AppleShare PDS file?

DISCUSSION ----------

CAUTION: Removing the AppleShare PDS file will result in a loss of file and folder access privileges. You will have to use the AppleShare Admin application to reassign these access privileges.

There are several ways to remove a corrupt AppleShare PDS file.

If you are using System 7.5.3 on an AppleShare File Server

Follow the steps below:

Step 1
Quit the AppleShare application.

Step 2
Choose the Find... command in the File menu.

Step 3
In the Find Items section, choose "on local disks" in the pop-up menu. In the two pop-up menus below, choose from left to right, name, and contains, then enter PDS in the field on the right.

Step 4
Click More Choices

Step 5
Press and hold the option key while you click and hold the size pop-up menu, choose visibility. In the pop-up menu under the field you entered PDS, choose

invisible.

Step 6
Click Find.

Step 7
The hit-list is presented in the Items Found window, and there should be an AppleShare PDS file for each volume on a Mac OS server. Click and drag the volume's PDS file listed to the trash. You should receive the message "The file can not be left in the trash. Delete it now?" Click OK.

Step 8
Reset access privileges by using the AppleShare Admin application.

If you are using ResEdit or third-party utility

If you have ResEdit or a third-party utility, like Norton Disk Editor, that is capable to change the visibility of a file, and you are skilled in using this application, follow these steps:

Step 1
Quit the AppleShare application.

Step 2
Use ResEdit or the third-party utility to make the AppleShare PDF file visible. Quit the application.

Step 3
Drag the AppleShare PDF file to the trash.

Step 4
Choose Empty Trash from the Special menu.

Step 5
Choose Restart from the Special menu.

Step 6
Reset access privileges using AppleShare Admin.

If you are not using System 7.5.3 on an AppleShare File Server or ResEdit
---
If you are not using System 7.5.3, and you do not have ResEdit or third-party utility, follow these directions:

NOTE: These directions will require you to have your AppleShare serial number available if you are using AppleShare version 4 or newer.

Step 1
Quit the AppleShare application.

Step 2

At the root level of your hard drive, choose New Folder from the File menu.

Step 3
Name the new folder "Old Users & Groups" or something similar.

Step 4
Open the System Folder, open the Preferences folder, find the Users & Groups Data File.

Step 5
Drag the Users & Groups Data File from the Preferences folder to the new folder you created above.

Step 6
Launch the AppleShare Admin which is usually located in the Apple Menu. Enter the server information including the serial number if prompted.

Step 7
Quit the AppleShare Admin.

Step 8
Move the Users & Groups Data File from the folder you created in Step 2 above to the Preferences folder in the System Folder. You should see the message "An item named 'Users & Groups Data File' already exists in this location. Do you want to replace it with the one you're moving?" Click OK.

Step 9
Again launch AppleShare Admin. You should see this message for every volume you have on your server, "All access privileges on the volume named (volume name) have been lost. You will need to reset access privileges for this volume." Click OK. A new AppleShare PDS file has been created for your server.

Step 10
Reset all access privileges while in AppleShare Admin.

If you have an Apple WorkGroup Server 95

Please see the article entitled "AppleShare File Server Software Will Not Start".

Centris 610 & 650, Quadra 800: Built-In Video (7/94)

Revised: 7/28/94
Security: Everyone

Centris 610 & 650, Quadra 800: Built-In Video (7/94)

==========

Article Created: 22 March 1993
Article Reviewed/Updated: 28 July 1994

TOPIC ----------

This article discusses the built-in video characteristics for the Macintosh Centris 610, Centris 650, and Quadra 800 computers.

The information in this article relative to the Centris 610 and Centris 650 is also relevant to the Quadra 610 and Quadra 650.

DISCUSSION ----------

The video hardware design of the Macintosh Centris 610 and 650 and the Quadra 800 derives closely from the earlier Quadra machines. Most of the Quadra video features were carried through to the Centris 610/650 and Quadra 800. The main exceptions are support for Apple convolution (flicker reduction) for NTSC and PAL, and support for 24 bits per pixel (bpp).

The video hardware for all three systems is virtually identical. The only exception is that the Centris 610 only requires 100 ns VRAM, while the Centris 650 and Quadra 800 require 80 ns VRAM.

The maximum supported pixel depth is 16 bpp. This is not a matter of the amount of VRAM in the machine -- it is a hardware limitation The RAM/DAC used by all three machines simply does not include the hardware required to do 24 bpp on any display. The same is true for the lack of support for Apple convolution -- the hardware necessary to do this is not present.

The Centris 610 and 650, and the Quadra 800, do support all the monitor types supported by the Quadra 950. This includes support for a 1024 x 768 resolution on 19-inch displays (which was not provided by the Quadra 700).

One area that was positively impacted was performance. At the same processor clock speed, the video section of these new machines outperforms the video section of the older Quadras. (Video performance on the Centris 650 is better

than the Quadra 700, and on the Quadra 800 is better than the Quadra 950.) Due to an improved video memory controller design, one wait state was removed from many of the frame buffer access cycles. This results in reduced memory access time overall, and therefore improved performance.

Article Change History:

Centris 610 & 650, Quadra 800: VRAM and Pixel Depth (7/94)

Revised: 7/28/94
Security: Everyone

Centris 610 & 650, Quadra 800: VRAM and Pixel Depth (7/94)

==========

Article Created: 22 March 1993
Article Reviewed/Updated: 28 July 1994

TOPIC -----

This article describes the memory configurations necessary to support each of the video modes at specific pixel depths on the Macintosh Centris 610 and 650, and the Quadra 800.

The information in this article relative to the Centris 610 and Centris 650 is also relevant to the Quadra 610 and Quadra 650.

DISCUSSION -----

The frame buffers on the Centris 610, Centris 650, and Quadra 800 systems support a variety of pixel depths, from 1 to 16 bits per pixel (bpp). The supported pixel depths (1, 2, 4, 8, or 16 bpp) depend on the display resolution and the amount of VRAM present. The fully expanded capability of all three systems is the same: 1MB of VRAM. As with the Quadra 950, these systems can be expanded using 256K (128K x 16) 80 nanosecond VRAM SIMMs (although the Centris 610 requires only 100 ns VRAM).

The following chart lists the Centris 610 and 650 and the Quadra 800 built-in video's maximum pixel depth supported, depending upon the VRAM configuration:

Display size	512K VRAM	1MB VRAM
12-inch landscape 384 x 512	16 bpp	16 bpp
12-inch Monochrome 640 x 480	8 bpp	8 bpp
13-inch RGB & VGA 640 x 480	8 bpp	16 bpp

SVGA		
800 x 600	8 bpp	16 bpp
15-inch Portrait (b/w)		
640 x 870	4 bpp	8 bpp
16" Color,		
832 x 624	8 bpp	16 bpp
19" Color,		
1024 x 768	4 bpp	8 bpp
2-Page Display (b/w)		
1152 x 870	4 bpp	8 bpp
21" Color		
1152 x 870	4 bpp	8 bpp
PAL		
underscan-640x480	8 bpp	16 bpp
overscan-768x576	8 bpp	16 bpp

PowerCD: Description (3/93) (Discontinued)

==========

Article Created: 22 March 1993
Article Reviewed/Updated: 7 June 1994

TOPIC ----------

This article describes the Apple PowerCD player.

DISCUSSION ----------

PowerCD is a portable CD-ROM drive, Photo CD player, and audio CD player all in one.

Connected to Macintosh computer, PowerCD is a low-cost portable CD-ROM drive for use with existing computer multimedia titles, business presentations, interactive learning, or games.

As a PhotoCD player, PowerCD allows you to access, manipulate and display high-quality photographic images on a television or computer monitor. With PowerCD, you can view and manipulate photographs (for example, zoom in, rotate, or crop them), then integrate audio with the photographs for presentations.

PowerCD can also be used as a standalone audio CD player. Users can listen to standard audio CDs either through headphones, through a television, or by attaching PowerCD to external stereo speakers.

PowerCD is battery operated and includes a standard AC power adapter and remote control.

The PowerCD supports the following CD-ROM formats:
• Macintosh HFS
• ISO-9660/High Sierra
• Standard CD-DA Audio
• CD-ROM XA, Multisession Kodak Photo CD

Macintosh: Sharing a CD-ROM on LAN Manager 2.1 Server (3/93)

Revised: 4/13/93
Security: Everyone

Macintosh: Sharing a CD-ROM on LAN Manager 2.1 Server (3/93)

==========

Article Created: 23 March 1993

TOPIC ----------

I want to share a CD-ROM on a Microsoft LAN Manager 2.1 server with a Macintosh sharing the CD-ROM. Is this possible?

DISCUSSION ----------

It is not possible for a Macintosh to share a CD-ROM on a LAN Manager 2.1 server. PCs can share CD-ROMs on a LAN Manager server, but in order to have a place to store desktop information and resource forks of Macintosh files, the LAN Manager AFP server stack creates invisible subdirectories and files in the same area as the files being accessed. CD-ROMs are read-only devices, therefore these invisible subdirectories and files can't be created. Consequently, you get a number of error messages on the server and client alike.

If you would like to talk to Microsoft about this, call them and ask for LAN Manager support.

Express Modem & Blind Dialing With FAX Software (12/94)

Revised: 12/1/94
Security: Everyone

Express Modem & Blind Dialing With FAX Software (12/94)

==========

Article Created: 16 March 1993
Article Reviewed/Updated: 1 December 1994

TOPIC ----------

Duo Express Modem: I'm unable to dial blindly (the modem not waiting for a dial tone) from the Fax software by entering "ATX0" in the prefix field.

Is this a known anomaly in the software or hardware? I made sure I was using a numeric "0" in the ATX0 command.

DISCUSSION ----------

The latest Express Modem control panel, version 1.5.3, which is part of Express Modem software 1.5.4 now contains an option to ignore dial tone when dialing. Choosing this setting will cause the dial tone to be ignored for data or Fax transmissions. Versions of the Express Modem control panel prior to 1.5.3 will still need the procedure below to accomplish blind dialing.

The comma dial modifier allows you to insert a pause while dialing as determined by the S8 register (default = 2 seconds). It is useful when accessing an outside phone line for example, "9,555-1212".

One side effect of the comma dial modifier is that all characters after the comma are blind-dialed, without waiting for a dial tone.

A workaround: insert a comma as the first character of the telephone number you are dialing, and then the entire number will be blind dialed. For example: ",555-1212".

Article Change History:
01 Dec 1994 - Updated article for Express Modem software 1.5.4.

Performa: Can't Use Apple Restore for External Drives (6/95)

==========

Article Created: 24 March 1993
Article Reviewed/Updated: 8 June 1995

TOPIC ----------

I want to place the Performa operating system onto external hard drives to allow booting Performa computers from the external drive.

It appears that Apple Restore looks for SCSI ID "0" as a destination for the restored software. This doesn't allow performing a restore to the external drive.

Is there any way to get Apple Restore to allow for restoring to external hard drives?

DISCUSSION ----------

Apple Restore will only let you restore to the internal drive (SCSI=0). The only workaround would be to use a third-party backup program like Retrospect.

Apple Restore was written with novice users in mind to make it as easy as possible to use.

OneScanner for Windows: Support for SCSI-2 Command (3/93)

Revised: 3/25/93
Security: Everyone

OneScanner for Windows: Support for SCSI-2 Command (3/93)

==========

Article Created: 25 March 1993

TOPIC ----------

Does the Apple OneScanner for Windows support SCSI-2 commands from an MS-DOS or Windows-compatible computer?

DISCUSSION ----------

The OneScanner is a SCSI-1 device. The Adaptec 1510 SCSI card that ships with the OneScanner accepts SCSI-2 commands, but it transposes them into SCSI-1 commands.

AppleTalk Connection for Macintosh: Description (3/93)

Revised: 3/24/93
Security: Everyone

AppleTalk Connection for Macintosh: Description (3/93)

==========

Article Created: 19 March 1993

TOPIC ----------

This article describes the AppleTalk Connection for Macintosh.

DISCUSSION ----------

AppleTalk Connection software for the Macintosh computer provides the most current version of Apple's signature networking software. New for this version is MacSNMP, Apple's implementation of the industry-standard SNMP network management protocol. With MacSNMP, networked Macintosh computers can be managed from a variety of available consoles. AppleTalk Connection also includes the latest version of the AppleTalk transport stack plus updated software drivers for LocalTalk, Ethernet, and Token Ring.

Since its introduction in 1983, AppleTalk has evolved into a powerful networking system that is suitable for large and small organizations, and one that remains the easiest in the industry to use. Creating a network is simply a matter of connecting devices with the appropriate cables; the AppleTalk Connection software takes over from there. And AppleTalk's Name Binding Protocol allows quick and easy access to network resources such as printers and servers using names that you create.

AppleTalk Connection is a complete foundation for network printing and file sharing, as well as for collaborative and client-server functions like electronic mail and database service. Apple will continue to enhance AppleTalk by integrating networking standards like SNMP to improve its scalability and efficiency.

Available through all Apple retail channels, AppleTalk Connection comes in a single-user package, with multi-user license extensions offered as an economical option. Apple also offers AppleTalk Administration, a product that provides comprehensive documentation and utilities for centralized

configuration of the SNMP software.

AppleTalk Connection Features

Includes MacSNMP network management software

- Built-in AppleTalk, Network, and Macintosh agents for easy manageability.
- Supports existing UNIX and Macintosh-based SNMP management consoles.
- Administrator can preconfigure and lock the SNMP software.
- Extensible architecture allows for additional agents and transports from Apple and third parties.

NBP name service

- Provides easy access to network resources using descriptive names.

Includes latest version of all AppleTalk software

- Compatible with all current Macintosh computers and system software versions.
- Integrated drivers support all Apple cards, with defined data-link interfaces for third-party cards.
- Convenient retail availability.

SNMP for Macintosh: Tech Bulletin, Network Management (3/93)

Revised: 3/29/93
Security: Everyone

SNMP for Macintosh: Tech Bulletin, Network Management (3/93)

==========

Article Created: 24 March 1993

TOPIC ----------

This article is a technology bulletin on Network Management - SNMP for Macintosh.

DISCUSSION ----------

Today's network managers are looking for the most efficient way to administer services, con-figure devices, and monitor usage on complex, multivendor networks. Apple has selected the Simple Network Management Protocol (SNMP) to meet this customer requirement. SNMP is an industry-standard protocol for network management defined by the Internet Engineering Task Force (IETF), the body that regulates the Internet technology and defines new standards for the TCP/IP protocol suite.

Because manageability is such a fundamental requirement for network components, Apple will be including SNMP agents in most of its future network product offerings. Apple Computer endorses SNMP as the management protocol for its TCP/IP Connection and AppleTalk Connection products. Together, the IETF and Apple have defined a standard MIB (Management Information Base) for AppleTalk, which is documented in RFC 1243. In addition, Apple has defined a MIB for reporting the Macintosh hardware and software configuration over SNMP, and provides this Macintosh Agent in both the AppleTalk Connection and TCP/IP Connection products.

Apple recognizes the value of integrating industry standards like SNMP into AppleTalk and the Macintosh Operating System as one of the ways Apple can develop the robust networking products required in today's large organizations. Future Apple network products and services will also have their own agents, providing the Macintosh with a level of SNMP manageability that is unmatched by other personal computers.

Apple's SNMP implementation on the Macintosh, called MacSNMP, has been designed to allow for future and third-party extensibility. This extensible architecture was achieved by adding a new manager to the Macintosh Operating System called the SNMP Manager. Designed as a Macintosh System 7 extension, the SNMP Manager and all SNMP Agents are implemented as shared libraries using a facility called the Shared Library Manager. The Shared Library Manager supports fully object-oriented libraries and provides for dynamic loading and linking of system libraries. Libraries designed for the Shared Library Manager also support inheritance and the ability to share code. Developers writing SNMP agents for the Macintosh will be able to implement them as shared libraries and take advantage of the facilities offered by the Shared Library Manager and the MacSNMP development environment.

The MacSNMP architecture consists of several components:

- The SNMP Manager with a built-in Network agent runs on the networked Macintosh, collecting a variety of information from the other SNMP agents and relaying it to the console. The transport-independent SNMP Manager handles all SNMP protocol generation and reception, and is capable of transmitting and receiving management information using AppleTalk, TCP/IP, and other network protocols.

- Different SNMP agents, which interface to their appropriate system components, drivers, entities, or applications, capture the operational variables and report the information that they gather to the SNMP Manager. This information is then passed on to the management console upon query. All protocol stack agents and the SNMP manager's own agent provide the traditional network management functions, capturing statistics on such events as CRC errors, buffer overruns, and timeouts. The Macintosh Agent provides a dynamic hard-ware and software profile of a Macintosh, including RAM and disk space, types of add-in cards, system software versions, and the types and versions of application programs resident on- disk.

- The individual SNMP transport modules provide the transport-independent interface between the different network protocol stacks and the SNMP Manager.

- Two applications, called MacSNMP Client and MacSNMP Admin, allow users and administrators to view and modify SNMP Manager state and configuration information.

This SNMP architecture allows Macintosh computers to be managed by a variety of SNMP consoles, including those from Sun Micro-systems, Hewlett-Packard, IBM, InterCon, Neon Software, and Cabletron.

The SNMP Manager API and developer's kit enables software and hardware developers to create additional SNMP agents for their Macintosh services and products. The architecture can support SNMP agents for routers; mail services; file services; general applications; different protocol stacks; drivers for Token Ring, Ethernet, and FDDI cards; and other peripherals and network products.

Technology Details and System Requirements

Depending on the agents installed, MacSNMP can report a wide variety of management information to the monitoring console. The following information is reported by the agents included with the core MacSNMP technology:

Information Reported by the Macintosh Agent

- Machine name, location, and description
- Machine icon
- The amount of time a machine has been turned on
- User name and phone number
- Printer type
- Default zone
- Chosen printer, printer zone, and printer driver
- System file location and information
- Application location and information
- NuBus card location, information, and identification
- SCSI device location, information, and identification
- Amount of RAM
- ROM and AppleTalk versions

Information Reported by the Network Agent

- SNMP protocols (such as packet count)
- Network cards (network speed, the number of cards installed, the type of protocol running on the card)
- The type of computer being used (Macintosh, Sun, and so on)
- The location of a computer on the network
- The computer owner's name

Other SNMP agents, which are included with their corresponding products, are available for

- The AppleTalk 58 stack (RFC 1243)
- The MacTCP 2.0 stack (RFC 1213)
- The Apple Internet Router Basic Connectivity Package

System Requirements

MacSNMP can be installed on any Macintosh computer running System 7 or later (4MB of RAM is recommended).

Ordering and Licensing Information

The core MacSNMP Client software for the Macintosh is available in the AppleTalk Connection and TCP/IP Connection products. These are available as retail products consisting of a single-user package with multi-user and volume license extensions. A MacSNMP developer kit is available from APDA. See the following product listings for details.

AppleTalk Connection for Macintosh Single-user package. (Order No. M8069Z/A)

- AppleTalk stack and driver software
- MacSNMP Client
- Macintosh, AppleTalk, and Network agents and MIBs

- AppleTalk Connection Installation and User's Guide

20-user license extension (Order No. M8065Z/A). This license extension contains no software.

AppleTalk Administration for Macintosh Single-user package (Order No. M8066Z/A)

- Complete AppleTalk Connection product
- MacSNMP Admin software
- About AppleTalk Administration
- MacSNMP Administrator's Guide
- AppleTalk Connection Installation and User's Guide
- Planning and Managing AppleTalk Networks

TCP/IP Connection for Macintosh Single-user package (Order No. M8113Z/A)

- MacTCP stack and driver software
- MacSNMP Client
- Macintosh, TCP/IP, and Network agents and MIBs
- TCP/IP Connection User's Guide

20-user license extension (Order No. M8115Z/A). This license extension contains no software.

TCP/IP Administration for Macintosh Single-user package (Order No. M8114Z/A)

- Complete TCP/IP Connection product
- MacTCP Admin and MacSNMP Admin software
- MacTCP Administrator's Guide
- MacSNMP Administrator's Guide
- TCP/IP Administration: Overview and Installation
- TCP/IP Connection User's Guide

MacSNMP 1.0 Developer's Kit
Available on the Essentials•Tools•Objects (E.T.O.) CD-ROM from APDA. (Order No. M0895LL)

To order APDA products or get additional information, contact APDA, whose addresses and phone numbers are listed in a separate Tech Info Library article.

TCP/IP Connection For Macintosh: Description (3/93)

Revised: 3/24/93
Security: Everyone

TCP/IP Connection For Macintosh: Description (3/93)

==========

Article Created: 24 March 1993

TOPIC ----------

This article describes TCP/IP Connection for Macintosh.

DISCUSSION ----------

TCP/IP Connection provides the software to connect a Macintosh personal computer to a TCP/IP network and to manage the Macintosh from a console using the Simple Network Management Protocol (SNMP).

The product includes:
• A TCP/IP protocol implementation (MacTCP)
• SNMP network management software
• Data-link drivers for Ethernet, LocalTalk, and Token Ring
• A Domain Name Resolver
• Support for Hosts files
• A ping test application (MacTCP Ping).

TCP/IP Connection is the source for the latest version of the TCP/IP networking protocols for the Macintosh computer. It provides the standard interface for all Macintosh-based TCP/IP network applications such as FTP, Telnet, NFS, and others. The product also provides driver software for Apple's LocalTalk, Ethernet, and Token Ring data links. The MacTCP configuration tools give the network administrator the choice of controlling all configuration or assigning various levels of configuration authority to users.

Available through all Apple retail channels, TCP/IP Connection can be purchased as a single-user package. Volume licensing is available through a user license extension as well as through Apple's volume-licensing program, both of which offer an economical option for large organizations.

Apple also offers TCP/IP Administration for the Macintosh computer, a product that provides comprehensive documentation and utilities for centralized configuration of the TCP/IP and SNMP software.

TCP/IP Connection Features

SNMP Network Management

- Allows Macintosh personal computers to fit into existing SNMP management systems.
- Provides remote network and system management of Macintosh computers over a TCP/IP network.
- Allows access to SNMP management information over both TCP/IP and AppleTalk protocols when combined with the AppleTalk Connection product for the Macintosh computer.

Standard API

- Provides a single, standard interface for all TCP/IP applications on the Macintosh.

Concurrent TCP/IP and AppleTalk services

- Supports multiple concurrent TCP/IP services.
- Supports concurrent use of TCP/IP and AppleTalk services. (For example, users can connect to TCP/IP services while printing to an AppleTalk network printer.)

Security and Control

- Administrators, using the TCP/IP Administration Kit, can preconfigure and lock both the TCP/IP and SNMP software.

TCP/IP Connection For Macintosh: Specifications (3/93)

Revised: 3/24/93
Security: Everyone

TCP/IP Connection For Macintosh: Specifications (3/93)

==========

Article Created: 24 March 1993

TOPIC ----------

This article describes system requirements, ordering and licensing information, and other product details for TCP/IP Connection for Macintosh.

DISCUSSION ----------

System Requirements

To use TCP/IP Connection you need a Macintosh Plus or later model Macintosh computer with the appropriate data link, such as built-in LocalTalk or Ethernet, or a networking card, such as the Apple Ethernet NB Card, Apple Ethernet LC Card, the original Apple EtherTalk Card, Apple Token Ring 4/16 NB Card, or the original Apple TokenTalk NB Card. You install TCP/IP Connection from a 1.4MB floppy disk or from the network.

LocalTalk connections also require a router with AppleTalk to TCP/IP gateway support, such as the Shiva Corporation FastPath 5 or the Cayman Systems GatorBox CS.

Token Ring connections also require the MacTCP Token Ring Extension software, contained in this product. Third-party Token Ring cards must be compatible with Apple's MacTCP Token Ring Extension software, or the manufacturer must provide its own extension software that is compatible with the MacTCP driver.

To use the MacTCP software, you need system software version 6.0.5 or later, or version 7 or later.

MacTCP implements the following protocols:
- IP (RFCs 791, 894; MIL-STD 1777)
- UDP (RFC 768)

- TCP (RFC 793, MIL-STD 1778)
- ARP (RFC 826)
- RARP (RFC 903)
- ICMP (RFC 792)
- BootP (RFCs 951, 1048)
- RIP (RFC 1058)
- DNS (RFCs 1034, 1035)
- Internet Subnetting (RFC 950)
- Internet Assigned Numbers (RFC 1340)

MacTCP complies with Requirements for Internet Hosts-Communication Layers (RFC 1122) and with A Standard for the Transmission of IP Datagrams over IEEE 802 Networks (RFC 1042).

To use the MacSNMP software, you need system software version 7.0 or later and 4MB of RAM. You also need an SNMP console that supports TCP/IP, such as those from IBM, Sun, and InterCon.

The SNMP agents included in the TCP/IP product support the following MIB definitions:

- TCP/IP MIB II (RFC 1213)
- Macintosh MIB (defined by Apple)

If you want the AppleTalk SNMP agent or plan to run the SNMP protocol over AppleTalk, to provide protocol redundancy, you need to purchase the AppleTalk Connection product for the Macintosh. This product supplies the AppleTalk SNMP transport and AppleTalk Agent needed for management over AppleTalk.

Ordering and Licensing Information

TCP/IP Connection and the other products in the Connection series are available as retail products consisting of a single-user package with multi-user license extensions. Associated TCP/IP and SNMP developer products are available from APDA. See the following product listing for details:

TCP/IP Connection for Macintosh Single-user package. (Order No. M8113Z/A)

- MacTCP stack and driver software
- MacSNMP Client
- Macintosh, TCP/IP, and Network agents and MIBs
- TCP/IP Connection User's Guide

20-user license extension. (Order No. M8115Z/A). This license extension contains no software.

TCP/IP Administration for Macintosh Single-user package. (Order No. M8114Z/A)

- Complete TCP/IP Connection product
- MacTCP Admin and MacSNMP Admin software
- MacTCP Administrator's Guide
- MacSNMP Administrator's Guide
- TCP/IP Administration: Overview and Installation
- TCP/IP Connection User's Guide

AppleTalk Connection for Macintosh Single-user package. (Order No. M8069Z/A)

- AppleTalk stack and driver software
- MacSNMP Client
- Macintosh, AppleTalk, and Network agents and MIBs
- AppleTalk Connection Installation and User's Guide

20-user license extension. (Order No. M8065Z/A). This license extension contains no software.

AppleTalk Administration for Macintosh Single-user package. (Order No. M8066Z/A)

- Complete AppleTalk Connection product
- MacSNMP Admin software
- MacSNMP Administrator's Guide
- About AppleTalk Administration
- AppleTalk Connection Installation and User's Guide
- Planning and Managing AppleTalk Networks

OSI Connection for Macintosh Single-user package. (Order No. M8096Z/A)

- MacOSI Transport and driver software
- MacOSI Transport connection tool
- MacOSI Transport Administrator's Guide

MacTCP 2.0 Developer's Kit - MacSNMP 1.0 Developer's Kit
Available on the Essentials•Tools•Objects (E.T.O.) CD-ROM. Complete new subscriber package. (M0895LL)

AppleShare 4.1: Specifications (6/96)

Revised: 6/13/96
Security: Everyone

AppleShare 4.1: Specifications (6/96)

==========

Article Created: 24 March 1993
Article Reviewed/Updated: 13 June 1996

TOPIC -----

This article describes the AppleShare File and Print Server product details, specifications, and order information on the following:

- AppleShare 3.0.3
- AppleShare 4.0.2
- AppleShare 4.1
- AppleShare Pro 1.1

DISCUSSION -----

Product Details

Capabilities and services
- Includes file and print servers
- Supports Mac OS program linking and publish and subscribe
- Features an open environment that allows additional network services
- Macintosh client software built into every Macintosh; Windows client software sold separately

Sharing options
- On-line CD-ROM exchange
- Either folders or entire disks can be shared
- Easy server selection through the Chooser
- Intuitive, consistent access to shared resources
- User-controlled access to information

Print spooling
- Spooling for up to five networked printers
- Centralized queue management
- Simultaneous print requests accepted
- Frees client workstations immediately

• Print log for up to 1,000 print jobs

Administrator control
• Administrator-determined number of connected users
• Server messages can be broadcast or sent to selected users
• Administrator-determined cache sizes to maximize performance

Security
• Minimum password length
• Password aging
• Password history to prevent immediate reuse
• Ability to disallow saved passwords
• Account disable after specified number of password failures
• Adjustable time limit for temporary accounts
• Guest access turned off by default
• Copy-protection setting for documents
• "Lock" setting for folders
• Adjustable number of concurrent application launches *
• Inherited folder privileges
• Administrator log-off of any user

* Requires a multilaunch application and appropriate license agreement.

Begin_Table
Specifications

	3.0.3	4.0.2	4.1	Pro 1.1
Concurrent logons	120	150	150	200
Active Users	15	30	30	50
Open files	346	346	346	5000
Number of hard disks	7	7	7	20
Users **	8192	8192	8192	8192
Groups **	8192	8192	8192	8192
Users in group **	8191	8191	8191	8191
Groups per user	42	42	42	42
Locked ranges per user	20	20	20	20
Apple II logon	yes	yes	yes	no
Apple II network startups	40	n/a	n/a	n/a
Minimum RAM	4MB	8MB	8MB	16MB
System software	7.0	7.1	7.5	A/UX 3.1

** The sum of users and groups cannot exceed 8,192. The recommended limit is 2,000.
End_Table

Supported platforms
• AppleShare 3.0.3: 68030-based (or earlier) Macintosh computers
• AppleShare 4.0.2: 68040-based Macintosh computers*
• AppleShare 4.1: PowerPC processor-based computers, but not PCI-based systems like the Power Macintosh 7200, 7500, 8500, or 9500.

* AppleShare 4.0.2 does not run on the Macintosh Centris/Quadra 660AV and Quadra 840AV computers. Early versions of AppleShare 4.0.2 shipped with a set of installation disks for Power Macintosh computers. This is no longer the supported configuration and customers need to upgrade to AppleShare 4.1 to setup a PowerPC based server.

AppleShare Client

Macintosh

- An Apple Macintosh computer with an internal hard disk drive and at least 4MB of RAM
- Mac OS software version 6.0.7 or later
- System 7.5 required for performance of AppleShare 4.1

Windows

- Any IBM or 100 percent compatible computer running Intel processor 386 or greater; ISA, MicroChannel, VISA, and EISA internal buses; 4MB of RAM
- Windows 3.1, 3.11, or Windows for Workgroups 3.11 software
- MS-DOS 5.0 or later
- Ethernet network adapter card
- NDIS 3.0 or ODI network interface driver

Network requirements

An AppleTalk network connection (through LocalTalk, Ethernet, Token Ring, or Apple Remote Access software); Windows software-based computers must be connected through Ethernet

AppleShare Access Privileges

- Both the user and the administrator can control access to information
- Eight different access privileges
  - How users view shared data:
    - Full access privileges
    - Drop folder, write capability only
    - No access privileges
  - How users protect their data:
    - Can't see enclosed folders
    - Can't see enclosed files
    - Can't write to folder
    - Can't write to or see folders
    - Can't write to or see files

Ordering Information

AppleShare 3.0.1
Order No. M0090LL/B

AppleShare 4.0.2
Order No. M3995Z/A

AppleShare 4.1

(Included in some PowerPC-based Workgroup Server configurations)

AppleShare Pro 1.1
Order No. M6825Z/B

AppleShare Client for Windows
Order No. M3481Z/A
(Also included in PowerPC processor-based Workgroup Server configurations; client network license is included and allows the installation of the client software on any Windows software-based PC on the network)

Article Change History:
13 Jun 1996 - Changed title to show AppleShare 4.1.
02 Oct 1995 - Added number of active users.
26 Sep 1995 - Made correction for AppleShare 4.1.

AppleShare 4.1: Description (6/96)

==========

Article Created: 24 March 1993
Article Reviewed/Updated: 13 June 1996

TOPIC --

This article describes the AppleShare File and Print Server family, including:

- AppleShare 3.0.3
- AppleShare 4.0.2
- AppleShare 4.2
- AppleShare Pro

DISCUSSION --

AppleShare is high-performance, easy-to-use file and print sharing software that allows networked Macintosh and Microsoft Windows software-based computers to share files, applications, and printers.

With AppleShare file server software, organizations can store all of their shared files and applications in a single, central location, providing convenient, easy access to every user on the local area network. By allowing networked users to centralize all key files and applications for easy sharing, AppleShare improves everyone's productivity. It eliminates time spent looking for files, worrying about misplaced documents, and determining the file or application version.

AppleShare print server software offers all users queued access to up to five networked printers. This time saving function allows users to be more productive because they can use their computers to tackle other tasks instead of waiting for documents to print.

Now, all networked users can connect easily to an AppleShare server. AppleShare lets Macintosh users access shared resources via the Mac OS, and Windows software-based computers users via the Windows interface. AppleShare's network architecture coexists with other application programs and networking services such as Novell NetWare, Windows for Workgroups, and even the Internet.

Yet for all of its power and capabilities, AppleShare is extremely reliable and easy to set up, use, and maintain.

It continues in the "plug and play" tradition established by the Macintosh more than a decade ago; most system administrators find that they can get an AppleShare server up and running within 15 minutes. And overall maintenance including the addition and deletion of users is so simple that a dedicated, full-time administrator is not required. In fact, because AppleShare is so easy to install, maintain, reconfigure, and expand, it offers the lowest long-term cost of ownership of any product in its class.

Whether your organization is a small or medium-size business, a classroom, or a department within a global enterprise, AppleShare improves collaboration and increases efficiency for all users.

AppleShare Family and Advantages

• Easy to set up, administer, and use
• Performance scalable to any size AppleTalk workgroup
• Powerful, flexible security

Which version of AppleShare is right for you? The answer depends on the size of your workgroup and your performance needs.

• AppleShare 3.0.3 is designed for smaller workgroups of Macintosh and Windows software-based computers that have outgrown the basic file sharing capabilities of the Mac OS. It runs on 68030-based, or earlier, Macintosh computers.

NOTE: Appleshare 3.0.x can be run and is supported on 68040-based Macintosh computers, but is not marketed for them. However, since customers with 68040-based Macintosh computers will greatly benefit from the increased performance of AppleShare 4.0.2, it is the recommended version.

• AppleShare 4.0.2 offers significant performance improvements over AppleShare 3.0.1, and runs on 68040-based Macintosh computers, except the Macintosh Quadra 660AV and Quadra 840AV computers. Like AppleShare 3.0.1, it's appropriate for smaller, cross-platform workgroups that want to move beyond simple Mac OS file sharing and is extremely easy to set up and administer.

• AppleShare 4.2 is the highest-performance AppleShare version available. Optimized for Apple PowerPC processor-based Workgroup Servers, it offers higher performance and supports more users than previous versions, yet retains the ease of use shared by the other product offerings in the AppleShare family.

• AppleShare Pro 1.1 utilizes the specialized hardware and operating system of the Workgroup Server 95 running A/UX. AppleShare Pro boosts server performance to more than four times that of AppleShare 3 running on a Macintosh Quadra 950. Larger workgroups that need the higher-performance file and print service will want to take full advantage of the speed and scalability of AppleShare Pro. Because it has the traditional AppleShare ease of setup and administration, you already know how to use it. In addition, AppleShare Pro supports up to 5,000 open files and 20 hard disks connected to the server. Now there is an AppleShare

product for even the most demanding of server environments.

Article Change History:
13 Jun 1996 - Change title to show AppleShare 4.1.
12 Mar 1996 - Added information about 3.0.x running on 68040 computers.
12 Jan 1996 - Updated with AppleShare 4.2 which replaced 4.1.

MacX: How To Work With DEC Application Keypad (3/93)

Revised: 4/6/93
Security: Everyone

MacX: How To Work With DEC Application Keypad (3/93)

==========

Article Created: 24 March 1993

TOPIC ----------

Operating System: VAX/VMS
Window System: DECwindows

MacX does not handle some of the Macintosh keypad keys correctly in a DECterm set to Application Keypad (SET TERM/APPL). Specifically, I found that the following keypad keys did not produce the application sequences:

- Keypad Num Lock
- Keypad =
- Keypad /
- Keypad *
- Keypad +

In fact, these keys produced the character on the key face (except Num Lock, which, in TPU, produced an apparent Control-K (Learn) sequence).

DISCUSSION ----------

You need to map the keys of the numeric keypad to send the PFn keysyms using the program MSAX$MODMAP. This program is located in directory SYS$SYSTEM:

For example, to map the top row of the keypads, the correct mapping is:

```
keycode 79 = KP_F1
keycode 89 = KP_F2
keycode 83 = KP_F3
keycode 75 = KP_F4
```

If you have PATHWORKS for Macintosh, DEC has some example mapping files in

the directory MSA$EXAMPLES. They are called:

```
MSAX$INSCRIPTIONAL_EXTENDED_KEYBOARD.DAT
MSAX$POSITIONAL_EXTENDED_KEYBOARD.DAT
MSAX$STANDARD_KEYBOARD.DAT
```

You will find the above mapping in these files also.

You run MSAX$MODMAP as a client by using this remote command in MacX:

```
MCR MSAX$MODMAP mapping-file-name
```

After that, your keypad keys should work correctly in Application Keypad mode.

For more information regarding MSAX$MODMAP, refer to the DECwindows documentation.

AppleShare 3.0: Transfers Are Faster Server to Client (3/93)

Revised: 4/6/93
Security: Everyone

AppleShare 3.0: Transfers Are Faster Server to Client (3/93)

==========

Article Created: 24 March 1993

TOPIC -----

AppleShare pulls (workstation copy from server) are always faster than pushes (workstation copy to server). I would imagine this is at the AFP level, but could you explain?

My environment:
• AppleShare 3.0
• Twisted-pair Phone Net, Active Star
• AppleShare running on a Macintosh IIci, and Quadra 950
• AppleShare is the only application running on each computer

DISCUSSION -----

The server-to-workstation copies are faster for two reasons. First, the server-to-workstation copy requires fewer transactions to accomplish the same job. Second, the retransmission timer is smaller for the workstation than for the server, which in the event of any packet loss results in faster retransmission of lost packets and thus faster over-all transfer times.

Workstation-to-Server Copy

Workstation ------> ATP TReq ------> Server
Workstation <------ ATP TReq <------ Server
Workstation ------> ATP TRsp ------> Server (1 to 8 response packets)
...
Workstation <------ ATP TRel <------ Server
Workstation <------ ATP TRsp <------ Server
Workstation ------> ATP TRel ------> Server

1) There are more transactions (two packets in each direction) in

workstation to server because the workstation has to initiate the transaction by requesting that the server request the data from the workstation. This results in four additional packets, with the increased possibility of lost packets and retransmission. In addition, in the case of workstation-to-server copies, there are actually two ATP XO transactions, one wrapped inside the other, which means there are TRel's passed in both directions; if either side losses the TRel packet no data will be passed in either direction for at least 30 seconds (TRel timer value), possibly more. The TRel timer value is set by the application program. TRels are never retransmitted:, see Inside AppleTalk, Second Edition, for more details concerning ATP XO transmissions.

2) The retransmission timer in the server is six seconds. If any of the eight data packets are lost, the server waits six seconds before requesting retransmission of the data by the workstation.

```
Server-to-Workstation Copy
--------------------------
Workstation ------> ATP TReq ------> Server
Workstation <------ ATP TRsp <------ Server (1 to 8 response packets)
...
Workstation ------> ATP TRel ------> Server
```

In this case, several factors could contribute to faster transfer times. First, there are fewer transactions to complete the operation and less traffic is generated. In addition, if any of the data packets (1 - 8 TRsp) packets are lost, the workstation will request their retransmission in two seconds, verses the six seconds the server waits (see in the prior example) before asking for retransmission.

There is no simple way to change the ATP retransmission timer values. These timers are selected by the application developer at compile time and are therefore not easily changed.

StyleWriter II: Executive Paper Size (2/95)

Revised: 2/16/95
Security: Everyone

StyleWriter II: Executive Paper Size (2/95)

==========

Article Created: 25 March 1993
Article Reviewed/Updated: 16 February 1995

TOPIC ----------

The StyleWriter II manual states that the Executive paper size is 7.5-in.w by 10.5-in.h, but the Page Setup dialog shows it as 5.5-in.w by 8.5-in.h.

Which one is correct?

DISCUSSION ----------

You are correct that the manual states one size for Executive paper, and the StyleWriter II driver uses another. Version 1.2 of StyleWriter driver has been changed to use 7.5-in.w x 10.5-in.h as the Executive paper size. Apple has decided to standardize on that size for all Apple printers.

If you want to modify the StyleWriter II driver to use the 7.5-in.w by 10.5-in.h paper size, the best way is to modify the StyleWriter II PREC id=3 resource. Just change the paper height and width values of Btn 3 to 1260 (105x12) and 900 (75x12), respectively.

Article Change History:
16 Feb 1995 - Added version of driver that corrects issue.
08 Jun 1993 - Added width and height abbreviations.

Easy Access: Slow Keys Appears to Prevent Keyboard Input (3/93)

Revised: 3/25/93
Security: Everyone

Easy Access: Slow Keys Appears to Prevent Keyboard Input (3/93)

==========

Article Created: 25 March 1993

TOPIC ----------

I lose the ability to input data from the keyboard after entering numerous hard returns in Microsoft Word or TeachText. I hear a beep, then the keyboard won't accept more keystrokes -- it just makes a strange beep. Even quitting the application doesn't fix it.

This doesn't happen with extensions off, but occurs even immediately after a clean install.

DISCUSSION ----------

This is a feature of Easy Access called Slow Keys. Slow Keys gets turned on whenever the return key is held down for 8 consecutive seconds (there's a warning beep after 4 seconds). Thus, even though all features of Easy Access Control Panel may be off, Slow Keys can still activate itself. Slow Keys is supposed to prevent accidental key presses by waiting a brief amount of time before accepting a keystroke. It may appear as though the keyboard is locked up.

When this happens, turn off Slow Keys in the Easy Access control panel (the mouse will still be functional). Be aware, however, that holding the return key down again for another 8 seconds will turn it back on. The long-term solution is simply to remove Easy Access.

QuickTime for Windows: Library not found Message (3/93)

Revised: 4/5/93
Security: Everyone

QuickTime for Windows: "Library not found" Message (3/93)

==========

Article Created: 29 March 1993

TOPIC ----------

I just installed QuickTime for Windows on a DOS 5.0/Windows 3.1 machine. Installation ran fine with no errors reported.

In trying to start the applications MoviePlayer and PictureViewer, I got the error message: "QuickTime for Windows could not run because the QuickTime library could not be found."

My assumption is that Windows can't find one or more of the .DLLs that comes with QuickTime. Where should the .DDLs be stored? What in the Windows environment needs to be updated ?

QUESTION ----------

It is very likely that the QuickTime applications cannot locate the required .DLL files.

The installation program normally ensures that the SET LIB, SET INCLUDE, and PATH statements are properly updated to include the directories containing the QuickTime for Windows tools, libraries, and header files. That is, unless you do not allow the SETUP program to modify your AUTOEXEC.BAT file.

In this case, you would need to modify the AUTOEXEC.BAT file yourself. The suggested changes should be in a file called AUTOEXEC.QTW. SETUP produced the file during the installation process. The basic alteration required to get the MoviePlayer and PictureViewer applications working is to ensure a PATH entry pointing to the QTW\BIN directory exists.

LaserWriter Pro: Printer Control Language Commands (5/96)

Revised: 5/7/96
Security: Everyone

LaserWriter Pro: Printer Control Language Commands (5/96)

==========

Article Created: 29 March 1993
Article Reviewed/Updated: 7 May 1996

TOPIC ----------

1) What fonts does the Primary Symbol Set in HP PCL4 (LaserJet emulation) in the LaserWriter Pro support? I tried to select a font other than ROMAN-8 or PC-8 US but the printer ignored it.

2) Is there support for IBM-PC (Danish/Norwegian) or ISO-60 Norway which is needed for programs not supporting ROMAN-8?

3) What is the command to change the page length on a LaserWriter Pro?

DISCUSSION ----------

In regards to questions 1 and 2, there is support for ISO-60 Norway and a variety of other Symbol Sets. There are two ways to enable them:

• To use the specified Symbol Set for just the current job:

In HP emulation mode, type <ESC>(#X where #X is a number/letter pair. For example, type <ESC>(8U to utilize the Roman-8 symbol set.

Note:
"8U" is the HP number/letter pair value for the Roman-8 symbol set, (see chart below).

• To change the default Symbol Set using PostScript. Send the following three lines of PostScript to the printer:

```
%==========================================================
% Begin PostScript code
%
(%LaserJetIIP%)
```

```
<</FontSymbolSet 277>>
setdevparams
%
% End PostScript code
%============================================================
```

Notes:

• The PostScript code to change the default PCL font does not persist beyond power cycles. Typically, there are "_NV" suffixes that can be added to devices (such as %Serial_NV% or %Parallel_NV%) which provide storing of persistent parameters, however, the %LaserJetIIP% device does not have any such storage, so you will not be able to set a default PCL font to survive power cycles.

The only workarounds we can think of are to download the PostScript code each time the printer is restarted, or to just leave the printer ON.

• "277" is the Symbol Set Value for the Roman-8 symbol set, (see chart below).

Begin_Table

Symbol Sets Supported by the LaserWriter Pro

Symbol Set	HP #/letter pair	Symbol Set Value
ISO-60 Norweg	øD	4
ISO-25 French	øF	6
German	øG	7
ISO-15 Italian	øI	9
ISO-14 JISASCII	øK	11
ECMA-94 Latin 1	øN	14
ISO-11 Swedish	øS	19
ISO-6 ASCII	øU	21
ISO-61 Norweg	1D	36
ISO-4 UK	1E	37
ISO-69 French	1F	38
ISO-21 German	1G	39
Spanish	1S	51
ISO-57 Chinese	2K	75
ISO-17 Spanish	2S	83
ISO-2 IRV	2U	85
ISO-10 Swedish	3S	115
ISO-16 Portug	4S	147
ISO-84 Portug	5S	179
ISO-85 Spanish	6S	211
Roman-8	8U	277
PC-8 US	10U	341

End_Table

3) To change the page length on a LaserWriter Pro, use the HP escape code <ESC>&l#e##F while in HP emulation mode.

```
# is the top margin
## is text length (max 66)
```

Article Change History:
07 May 1996 - Added info on PostScript not surviving power cycles.

Apple Color Printer: Printer Description Files (9/94)

Revised: 9/1/94
Security: Everyone

Apple Color Printer: Printer Description Files (9/94)

==========

Article Created: 26 March 1993
Article Reviewed/Updated: 1 September 1994

TOPIC ----------

Is Apple working on a Quark Xpress PDF (Printer Description File) for the Apple Color Printer?

DISCUSSION ----------

We have not heard of any PDF (Printer Description File) files for the Apple Color Printer. If one is required for Xpress, you would have to acquire it from Quark, Inc. since it would be an application-specific file.

Apple is responsible for creating PPD (PostScript Printer Description) files for our LaserWriters. It's still up to the developers to acquire the files from Apple Developer Technical Support and then modify (if needed) and distribute the files.

Quadra: White Line on Display May Mean Wrong VRAM (5/94)

==========

Article Created: 25 March 1993
Article Reviewed/Updated: 18 May 1994

TOPIC ----------

On a Macintosh Quadra 610 or 650 with 1MB video RAM (VRAM) and set to 32,000 colors, a horizontal white line appears just below halfway down the screen. This is a 14-inch color display, but the symptom occurs with different monitors.

DISCUSSION ----------

Check the VRAM on these computers. The Macintosh Quadra 610 and 650 require VRAM with a speed of 80ns. 100ns VRAM -- such as that found in a Macintosh IIvx -- is not meant for use in these systems.

Article Change History:
18 May 1994 - Changed to reflect 80ns VRAM required for Quadra 610/650 and not Centris series.

Security: Everyone

Performa: Turning the Launcher Off (10/96)

==========

Article Created: 26 March 1993
Article Reviewed/Updated: 24 October 1996

TOPIC ----------

When I first got my Macintosh Performa I really appreciated Launcher. But now that I’m experienced with Macintosh, I don't need it. How do I turn it off?

DISCUSSION ----------

Launcher is great when you are just learning the Macintosh, but experienced users may not want or need it. Turning of the Launcher depends on which Performa you have.

If you have a Performa 200, 400, 600, or 600CD. With Launcher version 1.3 or earlier. Just remove the Launcher alias from the Startup Items folder:

1) Make sure you are in the Finder.

2) Open the Macintosh Hard Disk icon (double-click on it).

3) Open the System Folder. Find the Startup Items folder and open it.

4) Click on the Launcher alias. While holding down the mouse button, drag it out of the Startup Items folder and put it into the System folder (be careful that you do not drop it by accident into another folder within the System Folder; the safest way is to drop the Launcher alias onto the System Folder icon itself).

5) Restart the computer. Launcher should not be active. If you would like to have Launcher back at any time, all you need to do is put the Launcher alias back into the Startup Items folder and restart the computer.

If you have any other Performa computer's, with Launcher version 2.0 or later. Just turn off "Launcher open at Startup" in the Performa Control Panel:

1) Select Control Panels from the Apple Menu.

2) Double-Click on the Performa control panel.

3) Deselect the option for " Launcher Open at Startup."

4) Close the Performa control panel and the Control Panels.

5) Restart the computer. Launcher should not be active. If you would like to have Launcher back at any time, all you need to do is re-select " Launcher Open at Startup" in the Performa control panel.

Performa computers, with System 7.5 or later. Deselect the Show Launcher at system starup checkbox in the General Controls control panel.

Article Change History:
24 Oct 1996 - Added System 7.5 or later information.
22 Jun 1994 - Inlcuded the changes for Launcher 2.0 and Performa 1.0.

Macintosh LC III: Using VRAM from LC II (7/93)

Revised: 7/16/93
Security: Everyone

Macintosh LC III: Using VRAM from LC II (7/93)

==========

Article Created: 22 March 1993
Article Reviewed/Updated: 13 July 1993

TOPIC ----------

The Macintosh LC III comes with 512K of video RAM (VRAM) soldered onto the logic board, and one slot for adding an additional 256K of VRAM. Can I use the same 256K VRAM memory card used in the LC II for this upgrade? What happens if I use a 512K VRAM memory card from the LC II in the LC III?

DISCUSSION ----------

The 256K VRAM memory card used in the Macintosh LC II is fully compatible with the Macintosh LC III and Performa 450. Adding this memory card brings the LC III's total video RAM to 768K, allowing it to support 32,768 colors on some color monitors.

Adding a 512K VRAM card to the LC III will work as well, but the computer will recognize only 768K of the total 1024K installed.

For more information on which monitors are supported, search related articles.

Video RAM (VRAM)

- 512K standard supports:
  - 32,768 colors on the Macintosh 12-inch RGB Display
  - 256 colors on the AppleColor High-Resolution RGB Display (13"), Macintosh Color Display (14"), and Macintosh 16-inch Color Display
  - 256 shades of gray on the Macintosh 12-inch Monochrome Display
  - 16 shades of gray on the Macintosh Portrait Display (15")

- 768K (512K standard plus 256K VRAM card) option supports:
  - 32,768 colors on the Macintosh 12-inch RGB Display, AppleColor High-Resolution RGB Display (13"), and Macintosh Color Display (14")

- 256 colors on the Macintosh 16-inch Color Display
- 256 shades of gray on the Macintosh 12-inch Monochrome Display and Macintosh Portrait Display (15")

Article Change History:
07/13/93 - Revised to include Performa 450.

Macintosh Print Pack: Description (3/93)

Revised: 3/30/93
Security: Everyone

Macintosh Print Pack: Description (3/93)

==========

Article Created: 26 March 1993

TOPIC ----------

This article describes the Macintosh Print Pack.

DISCUSSION ----------

The Macintosh Print Pack allows MS-DOS and Windows-compatible printers to be connected to Macintosh computers with a set of hardware and software tools.

The Print Pack includes a special cable to connect a Macintosh to virtually any printer that has a standard Centronics parallel port. Also included are special software printer drivers, which are installed with a one-click installer.

You can select your printer through the Chooser. The printer drivers available are:

Epson FX (for use with compatible 9 pin dot-matrix printers and any MS-DOS or Windows-compatible laser printers that use this emulation)

Epson LQ (for use with compatible 24-pin dot-matrix printers and any MS-DOS or Windows-compatible laser printers that use this emulation)

Kodak Diconix
Canon BJ10EX (for connection to compatible ink jet printers)

The Macintosh Print Pack is compatible with:
• all Macintosh font formats: bitmap, TrueType, and Adobe's Type 1
• all Macintosh graphics formats: bitmap, PICT, and TIFF.

It supports all standard paper sizes, vertical or horizontal page formats, and reduction or enlargement.

The Macintosh Print Pack requires System 7.1 and for optimal performance. Apple recommends a minimum of 4MB of RAM.

Macintosh: DOS, OS/2, and Windows Compatibility (3/93)

Revised: 5/24/95
Security: Everyone

Macintosh: DOS, OS/2, and Windows Compatibility (3/93)

==========

Article Created: 24 March 1993
Article Reviewed/updated: 25 March 1994

TOPIC ----------

I hear that Macintosh computers are compatible with MS-DOS and Windows computers. How does Apple define compatible?

DISCUSSION ----------

The best way to start answering these questions is to determine what you are really asking about when you discuss compatibility. There are two questions to ask when defining levels of compatibility:

• Do you want to use MS-DOS or Windows files on a Macintosh?

• Do you want to run MS-DOS applications (software programs) on a Macintosh? The essential ingredients that ensure compatibility come with your Macintosh Performa computer: a SuperDrive disk drive and Macintosh PC Exchange software.

Every Macintosh has a built-in SuperDrive, which can read and write to DOS, Windows, OS/2, and Apple II formatted 3.5-inch floppy diskettes. These floppy diskettes can be 400K, 800K, or 1.44MB in capacity. Macintosh PC Exchange is included in the System software that comes with every Macintosh Performa, Power Macintosh and other selected Macintosh models.

With Macintosh PC Exchange users can easily work with files stored on DOS or Windows floppy disks. You can move files between a Macintosh and PC as easily as you can between two Macintosh computers. By creating program links, you can directly launch a Macintosh program and translate a file by simply double-clicking on your PC file. You can even format floppy disks in DOS or Windows format on your Macintosh using Macintosh PC Exchange.

If you want to run MS-DOS applications on your Macintosh, you will need an additional program such as SoftPC or SoftWindows (for the Power Macintosh series) from Insignia Solutions, Inc.

To locate a vendor's address and phone numbers, use the vendor name as a search string in the Apple Tech Info Library.

Article Change History:
25 March 1994 - Revised and retitled to reflect additional Macintosh models in addition to the Performa series.

Macintosh: Glossary of Terms (2/95)

==========

Article Created: 24 March 1993
Article Reviewed/Updated: 22 February 1995

TOPIC ----------

This article describes some of the common terms used when discussing Macintosh computers in general and the Performa models in particular.

DISCUSSION ----------

Alias

A file that stands for and points to a file, application, folder, or disk that you use as if it were the original. When you open an alias you are actually opening the original.

Apple Backup

An application for the Macintosh Performa computers that lets you copy files on your hard disk onto a series of high-density floppy disks. If the original files on your hard disk are lost or damaged, you can use these backup disks to restore your files.

Apple Desktop Bus (ADB)

Input circuitry built into most Apple computers. You use the ADB port to attach the keyboard, the mouse, and other input devices, such as graphics tablets and bar code readers.

Apple Menu

The menu at the left end of the menu bar, indicated by the Apple logo. You choose items from this menu to open items (such as desk accessories) that you have placed in the Apple Menu Items folder, and to get information about programs that are currently running ("About…").

Apple Restore

An application program that lets you restore information on your hard disk from a backup disks made with Apple Backup.

AppleTalk Network

A comprehensive network system that runs on a variety of cable systems and protocols. It facilitates communication between network devices, such as your computers, file servers, and printers, which may be a mixture of Apple and non-Apple products. Several elements make up an AppleTalk network system: AppleTalk software and AppleTalk hardware; the latter includes computing components and connectivity components.

AppleTalk Connectivity

AppleTalk's design lets you include a variety of data-link and cabling methods in a network system. Data-link and cabling methods widely used include LocalTalk; EtherTalk, using standard Ethernet media; and TokenTalk, using token ring media.

At Ease

Software that lets you use a Macintosh without using the Finder interface. At Ease provides easy ways to open files and prevents you from deleting files or changing system software. It is particularly suited to homes and classrooms.

Chooser

A program that lets you designate devices such as printers and shared disks on a network for your Macintosh to use.

Clipboard

An area in the computer's memory that functions as a holding place for what you last cut or copied. Information on the clipboard can be pasted into documents.

Control Panels

Programs that let you change various Macintosh features, such as sound, mouse movement, and keyboard options. Control panels are located inside the System folder.

Desk Accessories

Small application programs that you can add to your system. Desk accessories are installed in the Apple menu. Those provided with the Macintosh include the Calculator, the Chooser, Control Panels, Key Caps, and the Scrapbook.

Desktop

Your working environment when you are using the Finder interfaces on the computer (the menu bar and the background area on the screen), on which you work

with icons and windows.

Documents Folder

A folder on the desktop that is the default folder when you save a document. For (System 7.5 or Macintosh Performa only.)

Finder

The application program that maintains the Macintosh desktop and starts up other programs at your request. You use it to manage documents and programs, and to get information to and from disks. The Finder is what you see when you start up your computer.

Folder

A container for documents, programs, as well as other folders on the desktop or in directory windows.

Icon

A small pictorial representation of a file, disk, menu, option, or other object or feature.

Launcher

A system extension containing aliases of programs and other items. The Launcher window opens automatically when you start your computer. You can add to or change the contents of the Launcher to suit your own needs. (System 7.5 or Macintosh Performa only.)

NuBus

A bus architecture that lets you add a variety of components to your Macintosh by installing cards into expansion slots (such as video capture cards and networking).

Operating System

Software that coordinates the internal activities of the computer and its peripheral devices. An operating system performs basic tasks such as moving data to and from devices and managing information in memory.

ProDOS

The operating system for Apple II computers.

QuickTime

A System 7.x software extension that lets you play synchronized video and sound clips on your Macintosh.

Scrapbook

A desk accessory in which you can save frequently-used graphics, text, and sounds. The scrapbook can store multiple images. You can cut or copy images from the Scrapbook and paste them into documents.

SCSI (Small Computer Systems Interface)

A specification of mechanical and electrical standards for connecting certain peripheral devices (such as CD-ROM drives, external storage drives, and scanners) to a computer.

System File

A software file required for starting up the computer. You can customize it with fonts and desk accessories.

At Ease 1.0: Workaround for Forgotten Password (8/95)

==========

Article Created: 23 March 1993
Article Reviewed/Updated: 08 August 1995

TOPIC ----------

After I brought my Performa home, I set up At Ease. Now I've forgotten my password. What do I do?

DISCUSSION ----------

You'll need to start up your computer with another disk that has system software on it. If your computer came with a floppy disk called Utilities, you can use that disk.

1) Turn on the computer and push the Utilities disk into the floppy disk slot immediately.

2) The disk icon at the top of the desktop will be Utilities, and the next icon below that will be your Macintosh Hard Disk.

3) Open the Macintosh Hard Disk by double-clicking on its icon. Open the System Folder the same way.

4) Open the Preferences Folder. Click on the file called At Ease Preferences and drag it into the Trash.

5) From the Special menu, select Empty Trash.

6) Your Macintosh no longer remembers your At Ease Password. Now close the windows and restart your computer. You'll have to configure At Ease with a new Password you have selected.

Performa: Cure for Unsuccessful Startup After Restore (3/93)

==========

Article Created: 24 March 1993

TOPIC ----------

When I restored the backup software to my Performa, on the next startup attempt a picture of a diskette with a flashing question mark appeared, and nothing further happened. What do I do now?

DISCUSSION ----------

The Restore process should complete its procedure automatically, but it is not always successful. If you can't startup after a Restore, follow these steps:

1. Restart the computer with the Utilites diskette.

2. Move the System suitcase or the Finder out of the System Folder, then move it right back into the System Folder. If your folders are arranged in Icon view, you should see a small image of a Macintosh appear inside the System Folder icon.

3. Restart the computer again.

Another reason for the unsuccessful startup may have been that the corrupt system was not replaced during the restore process. This could happen if you were presented with the dialog, "The item 'System' on your computer is newer than the one on the backup diskette. Do you want to replace it with the older one or keep the newer one?" and you chose not to replace it with the older version.

If this happened, restore again, this time making certain to choose "Replace newer with older."

Performa: Disk-to-Disk Copying (3/93)

Revised: 3/30/93
Security: Everyone

Performa: Disk-to-Disk Copying (3/93)

==========

Article Created: 24 March 1993

TOPIC ----------

I just bought some software that tells me to make a copy of my original diskette for backup. What's the best way to do this?

DISCUSSION ----------

The best way to copy then entire content (programs, data) from one diskette to another is to drag its icon onto the icon of a blank diskette. If you are currently using At Ease, first get back to the Finder. Then follow the instructions below:

1) Insert the blank diskette. Format it (initialize it) if necessary.

2) Eject the blank diskette by choosing Eject Disk from the Special menu or pressing Command-E, but NOT by dragging the disk to the Trash.

3) Insert the diskette from which you want to copy.

4) Drag the icon of that diskette over the icon of the blank diskette. A dialog box will appear asking if you want to replace the entire contents of the blank diskette with the contents of the diskette currently in the drive. Click Okay.

This works with other Macintosh models as well.

==========

Article Created: 10 March 1993

TOPIC --

How do I switch paper bins on a LaserWriter Pro in HP emulation mode?

DISCUSSION ---

If you want to switch paper bins on a LaserWriter Pro in HP emulation mode, you must send an escape code sequence directly to the printer. One way to do this is to type the escape code sequence into to a text file. This is the HPCL escape code sequence to switch between paper bins:

ESC&l#H

where # is the bin selection value and the letter after the "&" is lowercase L.

0 is the bin selection value for the default paper tray.
1 " " for the upper tray.
2 " " for the manual feed tray.
4 " " for the lower tray.
6 " " for the envelope feeder.

For instance, to select the 500 page cassette (or lower tray), send "ESC&l4H" to the printer.

Macintosh: Specifications of Metal Enclosures (1/95)

Revised: 1/3/95
Security: Everyone

Macintosh: Specifications of Metal Enclosures (1/95)

==========

Article Created: 30 March 1993
Article Reviewed/Updated: 03 January 1995

TOPIC ----------

Which Macintosh computers utilize metal for their case construction and what are the specifications for the metal?

DISCUSSION ----------

At this date, metal enclosures are used for the following Macintosh models:

- Macintosh IIvx and IIvi
- Performa 600
- Centris/Quadra series (610, 650 and 660AV)
- Quadra 800 and 840AV
- All Power Macintosh models

The cases of these Macintosh models, as well as of some peripherals, are made of cold rolled prime sheet steel, #C1008-1010. Temper is commercial quality RB50 (RB65 Maximum). Finish is electrogalvanized preplate (bright or matte). Cosmetic paint application is site-specific depending on the point of origin, but the color of paint worldwide is Apple Platinum, per CCP 912 - 0037 - A.

The front panels of these Macintosh models and of some peripherals are made of Cycolac ABS grade KJC injection molded plastic. No paint finish is required on plastic panels or bezels.

Article Change History:
03 Jan 1995 - Reviewed for technical accuracy.
01 Apr 1994 - Added Power Macintosh models to the list.
25 Aug 1993 - Added AV Macintoshes to the list.

Color Classic, LC 520: Power On/Off Sequence (8/93)

Revised: 8/2/93
Security: Everyone

Color Classic, LC 520: Power On/Off Sequence (8/93)

==========

Article Created: 30 March 1993
Article Reviewed/Updated: 2 August 1993

TOPIC ----------

Could you explain the Macintosh Color Classic and Macintosh LC 520 Power On/Off sequence?

DISCUSSION ----------

The Macintosh Color Classic and Macintosh LC 520 use a power on sequence that is slightly different from all previous Macintosh computers. The Color Classic and LC 520 incorporate a power switch across the incoming AC power. This switch is similar to the storage switch on the PowerBook 100 and need only be switched off when storing the machine or when removing the logic board. Otherwise, trickle power is always supplied to the logic board. This main power switch is located on the right back side of the computer right next to where the power cord plugs into the unit.

To start up the machine, rock the main power switch to the on position, then press the Power On key on the keyboard (the key with a triangle pointing to the left located either at the top center or at the top right of the keyboard).

Before assuming a Color Classic or LC 520 is defective, be sure to press the keyboard Power On key.

In addition, once the machine is started up, the Power On key also serves as a Shut Down key. The effect of pressing the Power On key is the same as choosing Shut Down from the Special menu. After the user is prompted to save any open documents, the system will shut down. Choosing Shut Down with the mouse or pressing the Power On/Off key accomplishes the same result.

Article Change History:
2 August 1993 - Updated with references to LC 520 as well.

Macintosh Performa: Inserting a New Floppy Disk (3/93)

Revised: 4/6/93
Security: Everyone

Macintosh Performa: Inserting a New Floppy Disk (3/93)

==========

Article Created: 24 March 1993

TOPIC ----------

When I inserted a brand new blank diskette into the computer, the screen did not show the dialog box that the manual says it should. The floppy disk appears as if it has been used already, though there is nothing on it. Why is this?

DISCUSSION ----------

The most likely reason for this is that the diskette has been formatted by the manufacturer. You won't see the dialog asking if you want to format a diskette unless it is truly blank. Check the packaging that came with your floppy disks to see if they have been preformatted at the factory.

If you are running Macintosh PC Exchange, which is included with certain Performa models, even preformatted DOS disks will appear on the desktop without you being asking whether you want to initialize them (again, the packaging should indicate for which type of computer the disks are formatted).

If you find yourself with a preformatted DOS disk, just select Erase Disk from the Special menu, and PC Exchange (if installed) will present you with a choice of formats in a pulldown menu. Choose Macintosh, erase the disk, and you'll be all set.

Macintosh: No Printer Available Message (3/93)

Revised: 4/16/93
Security: Everyone

Macintosh: "No Printer Available" Message (3/93)

==========

Article Created: 24 March 1993

TOPIC ----------

I connected my Macintosh to my printer, turned everything on, and tried to print. But I got a message saying that there isn't a printer available.

DISCUSSION ----------

In order to use any printer connected to your Macintosh, you need to select it in the Chooser. You can find the Chooser in the Apple menu. Once you have clicked on the printer icon in the Chooser, make sure you have selected the port corresponding to the port on the Macintosh where you have connected the printer cable.

If the icon for your printer does not appear in the Chooser, you may need to reinstall the system software.

Performa: Running Apple II Software (3/93)

==========

Article Created: 24 March 1993

Article Change History

06/22/93 - REWROTE
- With more complete information.

TOPIC ----------

I would like information on running Apple II software on my Performa 430. Do I need a card? Where do I install it? Where do I get it, and the necessary supporting software?

DISCUSSION ----------

The Apple IIe Card is an accessory card that lets you run Apple IIe programs on several Macintosh models. At this writing, those models were Performa 400, 405, 430, and 450; Macintosh LC, LC II, and LC III; and Macintosh Color Classic. When the Macintosh is in the Apple IIe mode, it performs just like an Apple IIe Computer. You can start up and use Apple IIe software applications just as you would on an Apple IIe.

Features of the Apple IIe Card:

- Runs virtually all Apple IIe applications -- more than 10,000 programs.
- Applesoft BASIC programming language is built in. The Apple IIe Card supports ProDOS, DOS 3.3, and Apple II Pascal operating systems.
- The Macintosh hard drive may be partitioned for the ProDOS operating system to allow mass storage of Apple IIe programs and files.
- The Macintosh's internal SuperDrive can be used with ProDOS-formatted disks. ProDOS disks appear on the Macintosh desktop to allow easy transfer

of files to the hard drive.

- Allows connection of one UniDisk 3.5 disk drive and two Apple 5.25 disk drives through the Apple IIe Card's connection cable. This cable also allows the attachment of an Apple IIe joystick.

- Can print from Apple IIe applications to any printer that the Macintosh can select.

You can purchase the Apple IIe Card at your Local Apple Dealer. Also, the Local Apple Service Provider can install the card. You can find the Local Apple Dealer/Service Provider by calling (800) 538-9696. You can also purchase the Apple IIe Card from the Apple Catalog (800) 795-1000.

If you need help with the Apple IIe Card, then you can call the Apple Assistance Center at (800) SOS-APPL Extension 555.

Here is what you need to order:

- Apple IIe Card (Product Number M0444/D,Catalog Number B1043)

Optional Items:

- Apple 5.25 Drive (Product Number A9M0107, Catalog Number B1024)
- Joystick II (Product Number A2M2012, Catalog Number B1360)

Macintosh Performa: System Disks Not Included (7/95)

Revised: 7/10/95
Security: Everyone

Macintosh Performa: System Disks Not Included (7/95)

==========

Article Created: 24 March 1993
Article Reviewed/Updated: 10 July 1995

TOPIC ----------

I just purchased a Performa computer, and I think I'm missing something from my package. Where are the system disks? And where are the master disks for the application software that was included with my Performa? Everything is on the hard drive, but what happens if something happens to the software there?

DISCUSSION ----------

You are not missing anything. The Performa line of computers comes with Apple Backup, a software utility that allows you to backup the entire hard drive, including system software and application software, onto high density floppy disks. You can buy blank floppy disks at many office supply stores, as well as from computer retailers.

Many later Performa computers come with the Performa Backup CD. Computers that include the Performa Backup CD are:

Macintosh Performa 550 (later versions)
Macintosh Performa 575, 577, 578
Macintosh Performa 630CD, 635CD, 636CD, 637CD, 638CD
Macintosh Performa 5200 series
Macintosh Performa 6110CD, 6112CD, 6115CD, 6118CD

This disc contains all the software that is pre-loaded on your hard drive including system software and third party programs. If you have this disc, it is not necessary for you to run the Apple Backup program to back up your pre-loaded software. However, you should still back up your personal files and any other software you add later.

If at some time you remove software from your computer, you will need to use the backup disks you create and run the Apple Restore program or use the Performa

Backup CD to restore the software. This procedure will restore all the programs, but will replace them so that there are no duplicate copies on your hard drive. You will not lose any personal files.

Backing up regularly is a good habit to get into, as it provides a way for you to recover important documents that you have created, as well as system software and applications, should anything ever happen to your hard drive.

Article Change History:
10 Jul 1995 - Updated to include Performa Backup CD information.

System 7.1: LaserWriter Fonts Q&A (4/93)

Revised: 4/23/93
Security: Everyone

System 7.1: LaserWriter Fonts Q&A (4/93)

==========

Article Created: 13 April 1993

TOPIC ----------

1) Is it necessary to have the Adobe PostScript printer font in the Fonts folder if that font is loaded in the printer?

2) If I have downloaded fonts to the printer, are they lost when the printer is turned off?

3) Is it correct that the TrueType font is used for both the screen and printer?

4) Where can I get detailed documentation regarding fonts and System 7.1?

DISCUSSION ----------

1) If the font is not resident in the printer, the LaserWriter driver gets the font from the system and downloads the font to the printer. Therefore, since the font is already resident there is no need to have it in the Fonts folder.

2) Fonts can be temporarily downloaded either on a per-document basis or permanently downloaded until the printer's power is turned off. Only those fonts that are resident in ROM remain after a power cycle.

3) Outline fonts (TrueType) describe each letter, number, or symbol as a mathematical formula that define the character's shape and adjusts itself to make the character's size larger or smaller. Your Macintosh, therefore, needs on a single outline font in a particular typeface (such as Times) to able to print or display that typeface in different sizes.

4) You can get information from the "Macintosh User's Guide" which was

shipped with your computer or the System 7.1 upgrade kit. For more detailed information on font technology, I would recommend "Technical Introduction to the Macintosh Family, Second Edition" and "Apple LaserWriter Reference." Both of these books are published by Addison-Wesley.

AppleScript: Description (11/95)

Revised: 5/21/96
Security: Everyone

AppleScript: Description (11/95)

==========

Article Created: 20 April 1993
Article Reviewed/Updated: 27 November 1995

TOPIC ----------

AppleScript is a full-featured, object-oriented, programming language built into the Macintosh operating system. It can access internal software functionality of applications supporting the Open Scripting Architecture (OSA) of System 7.

DISCUSSION ----------

AppleScript extends the Macintosh graphical user interface to offer scripting for automation, customization, and application integration. It allows tailoring applications for developers. The AppleScript product consists of a language, a system software extension, a scripting environment, and add-on utilities.

FEATURES

- A natural, English-like syntax that can be localized and/or replaced.

- Integration with the Open Scripting Architecture for seamless communication with multiple applications both within a computer and across networks.

- Use of OSA standards that enable a consistent scripting experience.

- A Script Editor utility that records scripts from user actions.

BENEFITS

- Rapid custom solution development for business problems.

- Automation of complex tasks and work flows within organizations.

- Simplification of desktop and network administration within organizations.

• Automation of routine tasks that can increase personal productivity.

CONFIGURATION REQUIREMENTS

AppleScript requires a Macintosh configured with:

• A 68000 or greater processor
• Minimum 4 megabytes of RAM
• System 7.0 or later

RAM IMPACT

With no scripts running, AppleScript takes up less than 5K of RAM. A running script occupies less than 250K of RAM. Editing and compiling a script consumes about 750K RAM.

The AppleScript Extension requires 250K of disk space when installed uncompressed whether on the hard disk or on floppy disks.

The AppleScript Script Editor requires 150K of disk space. The Scriptable Text Editor requires 100K of disk space.

LANGUAGE

The AppleScript language takes an "English-like" approach. In addition, it's flexible enough to adapt easily to the needs of languages other than English. The base AppleScript language includes language control structures (repeat, if...then, and so on) and a library of built-in commands.

The default syntax of AppleScript is similar to HyperTalk in its natural language approach, but is more regular and predictable. You can replace the default AppleScript syntax with localized language dialects or programming languages (BASIC-like, C-like).

SYSTEM SOFTWARE

AppleScript is implemented as a component, and makes use of the QuickTime Component Manager. This makes it accessible to any developer who wants to take advantage of it to give an application intuitive, consistent scripting capabilities. Implementing the scripting system at the system software level makes scripting an integral part of the Macintosh computing environment.

SCRIPTING ENVIRONMENTS

AppleScript is delivered with a simple script generation and editing facility known as the Script Editor. The Script Editor generates scripts by "watching" the user's actions. Then you can edit and run the scripts.

The End User and Professional versions of the Script Editor differ in particular features, but the basic interface is the same.

ADD-ON EXTENSIONS AND UTILITIES

Several add-on components complete the scripting product for different users. Sample Scripts help teach in-house developers how to use scripting to solve pertinent business problems. They can modify sample scripts to meet particular needs.

End Users can use sample scripts to make using the Macintosh more convenient and effective. A script launching utility launches scripts while the computer's owner is absent.

Finally, Open Scripting Architecture Extensions (OSACS) can extend the reach of AppleScript into other development arenas.

USAGE SCENARIOS

The following categories are the major classes of functionality that AppleScripts enable. AppleScripts create new, custom solutions from existing applications. These could be internal or commercial solution sets. A custom front-end might be built that uses attached scripts to communicate with different applications while keeping this activity transparent to the user.

Work Flow

You can use scripts to automate the process of working: to move data, documents, and information from person to person, computer to computer, department to department, and application to application.

Work flow scripts will automate some aspect of a group's work process such as tracking and reporting the status of project elements, managing versions, routing documents, and archiving files.

They are likely to afford a low-cost minimum-feature alternative for those who don't require extensive document management systems. Work flow scripts access, manage, and report the "data about data" in their working environment and drive applications for communication, including electronic mail.

Administration

Scripts perform administrative functions including software installation and upgrades, backups, remote user support, and troubleshooting across local area networks.

Unattended Computing

Unattended scripts take the place of the user interaction with the Macintosh and provide for the execution of predetermined instructions when specified conditions are met.

Scripts let you "set-and-forget" a series of things for an application to do, or several applications together. You can write scripts that test for certain conditions in your environment, in some document, or in another Macintosh across the network, and execute when those conditions are met.

It's possible to impose time conditions on unattended scripts to allow delayed execution, often overnight.

This article is one of many available through the Apple Fax center. For a complete list of available Fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature). The Apple Fax center is available free of charge 24 hours a day, 7 days a week.

Security: Everyone

AppleScript: Software Components (4/93)

==========

Article Created: 20 April 1993

TOPIC ----------

This article describes the AppleScript software components.

DISCUSSION ----------

Software

- AppleScript Extension
  - Executes, compiles, and records scripts
  - AppleScript English dialect
  - Apple Events User Terminology (AEUT) resource: provides the human readable equivalents for the standard Apple Event suites.
  - Implementation of the API through which applications can ask for execution, compilation, editing and recording of scripts
  - The AppleScript Professional Scripting Environment contains an additional API for replacement editors, debugger, stepper and tracer.

- AppleScript Editing and Recording Utility
  - Simple user interface for generating scripts from user actions
  - Simple user interface for editing scripts
  - Mechanism for loading and saving scripts
  - The AppleScript Professional Scripting Environment includes a Script Editor implementation of a replacement editor, debugger, stepper, and tracer.

- WindowScript Interface Building Utility
  - Generates simple user interfaces
  - Allows users to easily draw an interface from standard Macintosh interface elements and attach scripts to those elements.

- Scriptable Text Editor

  - Sample scriptable and recordable text processor.

- Apple Event Manager v. 1.0.1 Extension
  - Supports AppleScript recording
  - Includes the Object Support Library (OSL)

- AppleScript Extensions
  - Extensions to AppleScript that extend the AppleScript language to include subroutines in other languages.

- 99 AppleScripts for the Macintosh
  - Scripts which get the Finder, Scriptable Text Editor, and other parts of the system to do interesting and useful things for end users.

- Installer and AppleScript Install Script
  - One-button install for all of the software components above.

- AppleScript Demonstration CD
  - A CD with restricted versions of scriptable applications that are available commercially along with documentation and sample scripts.

Documentation

- Getting Started with AppleScript
  - How to install AppleScript
  - How to run scripts
  - How to record and edit scripts with the Script Editor

- AppleScript Language Guide
  - Introduction to the AppleScript language
  - Scripting tutorial, language reference
  - Describes only the base language; doesn't describe the scriptable Finder.
  - Addendum on C-dialect.

- AppleScript Language Quick Reference
  - Summary of AppleScript language syntax and semantics

- AppleScript Solutions Guide
  - Supplements AppleScript Language Guide
  - Gives an overview of how to build AppleScript solutions using AppleScript, WindowScript, and Quickeys and DAL components.
  - Third-party-provided documentation on WindowScript, DAL, and Quickeys.

- The Apple Index of Applications that Support AppleScript
  - Identifies applications that support scripting and concisely shows what level of support they provide.

AppleScript: Modified Parts of the Macintosh OS (4/93)

Revised: 6/24/93
Security: Everyone

AppleScript: Modified Parts of the Macintosh OS (4/93)

==========

Article Created: 20 April 1993

Topic ----------

This article describes several pieces of the Macintosh operating system that must be modified to maximize the benefits that AppleScript offers.

Discussion ----------

Finder

Release of AppleScript is dependent on the user interface support in the Finder. The user interface to AppleScript in the Finder includes:

- Script document look
- Mechanism for setting the behavior of a script document on double-click (launch or edit)
- AppleScript recorder access
- One-step script access

The Finder becomes a scriptable and recordable application. A suite of Finder Apple Events and objects have been defined which act as the vocabulary of the Finder's extensions to AppleScript. Scripts can retrieve information about and control the Macintosh file system and desktop objects. This capability is implemented in Finder 7.1.1 as a Finder extension.

The Finder also allows you to attach scripts to objects such as disks, files, and folders. You can define actions that should occur when one of these objects is opened, closed, or something is dropped on it. In this way, AppleScript will generalize the "drag and drop" gesture in the Finder, and make it user-customizable.

System

The tasks done through tools such as the Control Panel and the Chooser are possible via AppleScript as well. A new Layer Manager allows the Script Editor to appear to be a part of an application.

Apple Event Manager

Two changes are required in the Apple Event Manager to support AppleScript:

- Recording support

- Roll-in of the Object Support Library (OSL)

Apple Event Manager 1.5 incorporates these changes.

QuickTime Component Manager

The QuickTime Component Manager is required for AppleScript execution, because AppleScript is implemented as a component.

System 7.1: Custom Install Bug with Monitor CDEV (6/93)

Revised: 6/11/93
Security: Everyone

System 7.1: Custom Install Bug with Monitor CDEV (6/93)

==========

Article Created: 29 March 1993

Article Change History

06/11/93 - REVISED & RETITLED
- The problem isn't strictly on the Quadra.

TOPIC ----------

You must use Easy Install when installing System 7.1 on these systems:

- Quadra 700, 900, and 950
- Macintosh LC and LC II
- PowerBooks 100, 140, and 170

DISCUSSION ----------

There is a known problem in the Custom Install that doesn't install all of the appropriate resources for the Monitors CDEV. The problem manifests itself when you try to use the OPTIONS portion of the CDEV. You will get an "Out of Memory" message, which will prevent you from accessing the options. By the way, replacing the Monitors CDEV doesn't resolve the issue!

LaserWriter Driver 7.2: Setup Button in the Chooser

==========

Article Created: 29 March 1993

TOPIC: ----------

After installing the LaserWriter Driver 7.2, I noticed a new feature, a "Setup" button in the Chooser. What's the purpose of the Setup button?

DISCUSSION: ----------

The LaserWriter Driver 7.2 Setup feature queries the printer for information. Specifically, it checks the printer model, the paper source (Built-in trays, 75-envelope feeder or optional 500-sheet tray), and imaging options which are available for your printer. It was put in place to determine what options should be presented in the Print dialog box.

Macintosh LC III: FPU Configurations with PDS Cards (7/93)

Revised: 7/16/93
Security: Everyone

Macintosh LC III: FPU Configurations with PDS Cards (7/93)

==========

Article Created: 1 April 1993
Article Reviewed/Updated: 13 July 1993

TOPIC ----------

A Macintosh LC III (Performa 450) can potentially have two FPUs: one on the logic board, and another on an expansion card. This article describes the four possible combinations of FPU (on logic board and on add-on card) in a Macintosh LC III.

DISCUSSION ----------

- No FPU on the logic board, and none on the expansion card. No problem.

- No FPU on the logic board, but one on the expansion card. The system uses the one on the card -- at 16 MHz.

- An FPU on the logic board, but none on the expansion card. The system uses the one on the logic board -- at 25 MHz.

- Two FPUs: one on the logic board, and one on the expansion card. Both FPUs are on the processor bus. There's no way to predict which one will respond to a given FPU cycle, and no way to assign priority.

Apple does NOT recommend removing an FPU from an expansion card and installing it on the logic board. Expansion card FPUs are 16 MHz, but the logic board requires a 25-MHz FPU.

If, after installing a card with an FPU, your system crashes, contact the vendor of the card to determine if there are any known incompatibilities between that card and the Macintosh LC III.

Article Change History:
07/13/93 - Revised to include Performa 450.
06/24/93 - Revised in response to input from Apple Engineering.

Macintosh: Which Models Can Start Up from CD-ROM (4/93)

==========

Article Created: 5 April 1993

TOPIC ----------

Which Macintosh models can be started up from a CD-ROM volume, and which can't?

DISCUSSION ----------

- The following Macintosh models don't support starting up from a CD-ROM:
  Macintosh 128K, 512K, 512Ke
  Macintosh Plus, SE, and SE/30
  Macintosh Portable
  Macintosh II, IIx, and IIcx
  Macintosh Classic

- All other Macintosh models do support starting up from a CD-ROM.

- We assume that all future models will be able to start up from a CD-ROM.

• One-time peace message - destroyed itself after 3/22/88

Extension
• Gives message “this disk needs minor repairs” for a locked floppy
• Infects unlocked floppies upon insertion
• Printing problems
• Extension conflicts
• MultiFinder crashes

ANTI, ANTI-ANGE
• First virus to modify code resource. Only affects application and Finder.
• May cause system crashes
• Cause applications to crash once infected (Anti-Ange)

CDEF
• Non-destructive
• Adds devices to the Desktop file

CDEF Mutation (discovered 24-Feb-93)
• Minor changes to the code

• same effects as original CDEF virus.

CODE 252
• Designed to spread from January 1 through June 5 of any year
• Virus triggered on and after June 6
• No intentional damage to file or disks
• Displays following message:
  "You have a virus."
  "Ha Ha Ha Ha Ha Ha Ha"
  "Now erasing all disks..."
  "Ha Ha Ha Ha Ha Ha Ha"
  "P.S. Have a nice day."
  "Ha Ha Ha Ha Ha Ha Ha"
  "(Click to continue...)"
• System may behave erratically
• Periodic system crashes
• Infects the System, Finder, and Applications
• Spreads very quickly under System 6.0.x

GARFIELD
• Odd menu behavior, most common is menus will not pop down.
• System files and applications are the most likely to get infected.
• Unknown how virus is spread.

INIT 29-B (Discoverd late March, 1994)
• no malicious intent.
• Spreads very rapidly.
• Infects all types of files: applications, system files and data files.
• Not contagious when found in a data file, meaning it can not spread from a data file
• Can reinfect a file again and again and again. This multiple infection characteristic can result in a wide variety of problems including out of memory error when running applications, the usual unexpected crashes, erratic behavior and an unexpected increase in file size.
• Running an application infected with INIT 29-B can spread the infection to the System file. Once the machine is rebooted, the virus will then spread from the infected System file to any file that is opened.

INIT-M (discovered May 1993)
• Designed to trigger on any Friday the 13th.
• The virus may infect all kinds of files -- including extensions, applications, preference files, and document files --
• Causes problems with the proper display of windows.
• The virus spreads and attacks only under System 7.0 or later.
• It does not spread or attack System 6.

MBDF A
• Spreads quickly
• System crashes
• Infects applications-adds MBDF resource with id 0
• Infects System file-adds MBDF resource with id 0 and renumbers existing MBDF id 0 to id 1.

MERRY CHRISTMAS VIRUS (discovered December, 1993)
• Only affects HyperCard stacks
• The Merry Christmas virus is written in HyperTalk, the HyperCard scripting language.
• Many stacks can function properly when infected, some such as Apple's Service Source cannot.
• Basically, the virus traps these messages:
 - openbackground
 - closebackground
 - idle
Then it looks in the Home stack script for itself, and if it isn't there it copies itself. From the Home stack it checks the currently active stack for itself, and if it isn't there it copies itself.
• merryxmas vaccine (HyperCard stack) will remove any occurances of the virus, as well preventing future infections. The stack is available on online services.

WDEF
• Instructs Finder to infect desktop
• Infects diskettes immediately upon insertion
• Slow performance
• System crashes
• System beeps
• Easily eradicated by rebuilding the desktop, or using SAM Virus Clinic
• Does not affect Macintosh computers running System 7 and higher.

Part II: Malicious Viruses

Malicious viruses damage files, and can even alter applications.

CHINATALK - Trojan Horse
• System extension
• Claims to be a female sound driver that is MacinTalk compatible
• Erases Hard Disk

CPRO - Trojan Horse
• application
• found in a file named CPRO141.SEA, looks like an update to a popular file compression program.
• If the CPro application is run, it attempts to format mounted hard disks and floppy disks.
• Only successful in formatting floppy disks.

FONTFINDER - Trojan Horse type
• Trigger date of Feb 10th, 1990
• Before date, displayed lists of fonts and point sizes in the System file
• On or after date, destroys directories of all mounted volumes

INIT 1984
• Trigger date of Friday 13th in 1991 and after
• Changes names and attributes of large number of folders and files to random strings
• Deletes a small percentage of files (< 2%)

INIT-9403 (discovered 3 March 1994)
• Damage: Alters applications and system files.
May destroy all disk volumes.
• Spreads: only in Italian version of MacOS so far, but extensive there.
• Systems affected: All Apple Macintosh computers, all systems.
• Once present, the virus alters the Finder file, and may insert copies of itself in various compaction, compression, and archive programs.
• These infected files can then spread the virus to other Macintoshes.
• This virus can only spread under the Italian release of MacOS.
• After a certain number of other files have been infected, the virus will erase disks connected to the system: it attempts to destroy disk information on all connected hard drives (> 16 Mb) and attempts to completely erase the boot volume.

MOSAIC - Trojan Horse type
• Destroys directories
• Renames attached disks to "GOTCHA"
• All available unmounted SCSI disks are mounted and destroyed

NVIR (including nVIRa, nVIRb, nVIR-f nFLU, AIDS, Hpat, Jude, MEV#)
• Infects by installing first in System file, often infects Finder and DA Handler. Lies dormant, then makes itself known.
• Applications beep when launched
• Files disappear mysteriously
• System crashes
• MacinTalk, if installed, says "don’t panic"

SCORES
• Creates invisible SCORES file
• Creates new desktop file in System folder
• Changes Notepad and Scrapbook to generic documents
• Causes system crashes after a certain time
• Difficulty running applications, and printing
• MS Excel files show damage
• Unexplained increases in file size
• Slow system

STEROID - Trojan Horse type
• Trigger date of July 1, 1990
• INIT which claims to speed up QuickDraw on 9-inch screens
• Shipped with a file name (Steroid) preceded by 2 invisible characters (so it loads before SAM Intercept and other extensions)
• Zeros your volume directories
• If file renamed, so that it runs after SAM, in advanced or custom modes you will get SAM alerts saying "There is an attempt to bypass the file system" when the Trojan attacks your volumes. Denying these attempts prevents the Trojan from doing damage.
• NOTE: Having CommToolbox installed seems to interfere with the INIT and keeps the erase from happening.

T4-A/T4-B
• Included with a game called GoMoku (versions 2.0 and 2.1)

- From GoMoku 2.0, virus will spread on August 15, 1992 and later
- From GoMoku 2.1, virus will spread on June 26, 1992 and later.
- Alters/damages The System file.
- System Extensions and INIT files unable to load
- System may become unbootable
- Attempts to modify applications on boot volume
- Damage applications by overwriting locations with infecting code. These damaged applications cannot be repaired.

T4-C

- Affects all Apple Macintosh computer systems and infects applications and System files.
- Under System 6, when activated, T4-C attempts to alter the System file, resulting in INIT files not being able to load. The system may be unbootable.
- Attempts to modify application files on the start-up volume. These damaged applications cannot be repaired.
- Damages the System file, therefore it is important to re-install your system if you think you may have been infected with this virus.

ZUC

- Adds a 1256 byte piece of code at the end of the first executed CODE resource (similar to ANTI)
- 90 seconds after launching infected application ZUC takes over cursor, moving it diagonally until you reboot.
- Only applications are infected.

Article Change History:
1 April 1994 - Added all viruses discovered since March, 1993.
5 March 1993 - Added info on variation of CDEF virus and new T4-C virus.

System 7.1: 32-Bit Enabler and Drive7 Incompatibility (3/93)

Revised: 7/27/93
Security: Everyone

System 7.1: 32-Bit Enabler and Drive7 Incompatibility (3/93)

==========

Article Created: 30 March 1993
Article Reviewed/Updated: 26 July 1993

TOPIC ----------

I have been unable to start my Macintosh SE/30 with the 32-Bit System Enabler, version 1.0.3, installed. I am also using Drive7 formatting software, driver version 2.3.2. I have already tried the various suggestions of doing a clean install of System 7.1, and removing inits.

DISCUSSION ----------

It has been verified that there is a third-party compatibility problem with the 32-Bit System Enabler, Version 1.0.3. The 32-Bit System Enabler is incompatible with versions 2.3.2 (and before) of Casa Blanca Works, Inc.'s Drive7 formatting software. When the 32-Bit System Enabler is used on a system which has been formatted with Drive7, the system will not start up.

Casa Blanca Works, Inc. is releasing a new version, 2.3.4, which they report corrects this problem.

To locate a vendor's address and phone number, use the vendor name as a search string.

Bitmap, PostScript, and TrueType Fonts Compared (7/96)

Revised: 7/1/96
Security: Everyone

Bitmap, PostScript, and TrueType Fonts Compared (7/96)

==========

Article Created: 2 April 1993
Article Reviewed/Updated: 01 July 1996

TOPIC ----------

This article compares bitmap, PostScript, and TrueType fonts as System 7 uses them. This article also explains the basics of font terminology and mechanics and answers some of the most frequently asked font questions.

You can mix all three types of fonts in the same document.

DISCUSSION ----------

Bitmap, TrueType, and PostScript Fonts

Suitcases can contain only bitmap and TrueType fonts; PostScript printer fonts are separate files. So a suitcase could contain just bitmap fonts, bitmap fonts and a corresponding TrueType font, or bitmap fonts that correspond to a separate PostScript printer font.

Bitmap Font

Bitmap fonts (also called fixed-size) is a representation of a certain font in an exact size. Bitmap fonts have the single letter "A" shown on their icons. You need a separate font file for each size of character you want to use.

These fonts consist of "pictures" of a typeface at specific sizes. For example, you might have bitmap fonts at 10, 12, and 18 point sizes installed in your Macintosh computer. “Times 12” is each character of the Times font at exactly 12 point.

If you try to use sizes that aren't installed, the Macintosh scales the largest installed bitmap, often resulting in type that is blocky and less legible. Specifically installed bitmap font sizes look smooth on any screen and print

smoothly on PostScript printers.

PostScript Font

PostScript is an industry-standard page-description language used for describing text, graphics, and digitized images for printed pages. This font has two parts to it; a bitmap font that the Macintosh uses like any other bitmap font, and a printer font used only by PostScript printers and Adobe Type manager software. All PostScript printer fonts have corresponding bitmaps; without them, your font does not appear in the Font menu of your applications. Like TrueType, PostScript printer fonts are a scalable outline. However, they require Adobe Type Manager (ATM) software to display without “jaggies” or print smoothly on a non-PostScript printer. The LaserWriter driver converts fonts to mathematical formulas instead of bitmapped images.

PostScript uses outline font technology to describe characters as a number of PostScript or B-spline curves. These curves are stored as mathematical constructs that form the outline of a character. The print controller processes the constructs to arrive at the desired size, style, and orientation, and then fills in the object with dots at the specific resolution of the printing device.

Several Apple LaserWriter printers support PostScript. PostScript fonts are also used in combination with bitmap fonts to support additional fonts on the Macintosh.

To use PostScript fonts with system software version 7.1, install bitmap and PostScript fonts in the Fonts folder. You can drag fonts or font suitcases to the closed System Folder, and the system will ask if you want to place them in the Fonts folder. Click the OK button.

In system software versions 7.0 or 7.0.1, install bitmap fonts by dragging a font suitcase or font file onto the closed System file. Put PostScript fonts in the Extensions folder.

For versions of System 6, use Font/DA Mover to install bitmap fonts into the System file and put PostScript files into the System Folder.

TrueType Font

TrueType (also called variable-size, outline, or scalable) fonts describe a typeface without rigidly specifying a size, and thus look good whichever size you choose. A TrueType font is a representation of a certain font defined by a scalable outline. Your Macintosh uses this outline to generate the size of the font you require. TrueType fonts provide sharp text at any size on any device, whether screen or printer. The TrueType font format is an open-industry standard, so you can mix and match TrueType fonts from various font vendors.

TrueType fonts are mathematical descriptions of text characters that store individual characters as a series of lines and curves, rather than a group of pixels (a bitmap). When an application asks for a character in any size, like 33

point, the Macintosh enlarges this outline to 33 point and fills in the dots for the display or printer output.

Only Macintosh computers running system 6.0.7 or later versions support TrueType fonts. To use TrueType fonts with System 6, be sure you have at least 1MB of RAM, install version 6.0.7 or later, and install the TrueType INIT. Install the fonts using Font/DA Mover version 4.1.

Versions of System 7 don't require the TrueType INIT nor the Font/DA Mover. Drag TrueType fonts onto the closed System file, and system software version 7.1 places fonts in the Fonts folder. TrueType is fully compatible with all Macintosh hardware. As part of the operating system of the Macintosh, it's transparent to the user, making it easier to use and to manage fonts.

TrueType prints on most devices, including PostScript devices. Very little has changed about printing in versions of System 7. Apple provides a TrueType core set that maps to the internal fonts in printer ROM, as they did in System 6. When you print a page with a third-party TrueType font on it, the LaserWriter driver sends the TrueType font and the TrueType scaling software to the printer. This ensures the best match to the screen display, because the printer uses the same font and scaling software.

Low-cost, non-PostScript printers (like the Personal LaserWriter LS, StyleWriter, HP DeskWriter, and so on), used with a Macintosh computer, can produce excellent type quality with System 7 and TrueType fonts. Also, direct-connect printers, driven by QuickDraw and TrueType, print with good type quality.

You can recognize TrueType fonts by these characteristics:

- Multiple letters on the icon — TrueType fonts have a scaling "A" shown on their icons.

- There's no point size in the name.

Using TrueType with PostScript

PostScript is a page-description language, and TrueType is a font technology. They aren't interchangeable. However, if a file requires a PostScript font not available in LaserWriter ROM nor in the System Folder, PostScript can use the available TrueType font to print. Using the TrueType font requires additional processing, and can reduce LaserWriter efficiency.

TrueType fonts don't necessarily take more disk space than PostScript Type 1 fonts. People sometimes look at the size of the downloadable Type 1 font and compare that to the size of the TrueType font. This isn't an accurate comparison, because a raw Type 1 font doesn't work on the Macintosh without the bitmap fonts and metrics contained in the screen font "suitcase". When the suitcase is added to the equation, PostScript fonts and TrueType fonts typically occupy about the same space.

TrueType fonts have the potential to become larger in point size than PostScript

Type 1 fonts, due to the enhanced functionality offered by the technology. Many high-quality headline typefaces aren't offered in PostScript form, because of limitations in the Type 1 technology -- like the number of points or contours in a character.

The core set of TrueType fonts (Times, Helvetica, Courier, Symbol, Avant Garde, Bookman, New Century Schoolbook, Palatino, Zapf Chancery, and Zapf Dingbats) have the same metrics as the fonts in the PostScript LaserWriters that Apple ships.

Using TrueType with Bitmap

Bitmap screen fonts come installed with TrueType fonts on systems using System 7 to maintain compatibility with documents created on Macintosh systems that don't have TrueType fonts. If a document uses a font family and size that's available as both a TrueType font and a bitmap font, the Font Manager uses the bitmap font when the application opens the document. If you want the Macintosh to use the TrueType font, you need to remove the bitmap font from your system.

For example, if a document uses Times 12, available in that size as a bitmap and as a TrueType font, the system uses bitmap. If a document uses Times 4, the system scales the TrueType font to that size because a bitmap version isn't available.

Using only TrueType fonts produces a closer match between appearance of type on the screen and when printed. However, any existing documents you've created with the bitmap fonts will be reformatted with the TrueType fonts, and line breaks in these documents may change. A document created on a system that has TrueType or the Adobe Type Manager installed will have different spacing, kerning, and so on, when opened on a system that doesn't have TrueType or the Adobe Type Manager.

What You Should Use

You can use both TrueType and PostScript fonts at the same time. You don’t, however, want to have both versions of the same font. Helvetica, for example, is available in both TrueType and PostScript, so you should decide on one to avoid needless duplication. This table shows what you can expect depending on what kind of font and what kind of printer you have:

Font Type	Screen	Non-PostScript Printer	Printer
TrueType	Smooth	Smooth	Smooth
PostScript without ATM	Jagged	Jagged	Smooth
PostScript with ATM	Smooth	Smooth	Smooth

How the Macintosh Displays Fonts on the Screen

==========

These are the steps your Macintosh goes through to display your request on screen:

STEP	ACTION
1	The System Software checks to see if there is a bitmap of the font you want in the exact point size you requested; if found it displays it.
2	If the requested point size is not present, it looks for the TrueType version of the font, which is used to generate the requested point size and then displayed.
3	If the TrueType version of the font is not present, the System Software scales the largest point size available to the requested size and displays it. This is when you see the “jaggies” on your screen.
4	However, if Adobe Type Manager is present, it steps in. If the PostScript printer file of the requested font is also present, Adobe Type Manager generates the requested point size and then pass it on to the System Software to be displayed.

The 128 Font Limit

Only font files and suitcases count towards the 128 limit. Printer files do not, as they are not resources loaded by the System. Drag any loose font files onto a suitcase and/or combine suitcases by dragging them on top of each other. If you want to make an empty suitcase, simply duplicate any suitcase, open it, and throw away the contents.

Font Corruption

Sometimes a font can become corrupted. The most obvious symptom of this is that it cannot be removed or causes your Macintosh to crash when you choose it. In System 7.0 or 7.1 you can check for font corruption by double-clicking on a suitcase or font file. An error message stating that it cannot be opened means you need to replace that suitcase or font from your original disks. In System 7.1, if you get an error message trying to pull a font or suitcase out of the Fonts folder, first make sure you have quit all running applications. Then, drag the Fonts folder out of the System Folder onto the Desktop. You should now be able to remove corrupt font or suitcase. When you’re finished, put the Fonts folder back in the System Folder.

Just Drag and Drop

Most font-related problems come from missing pieces; a quick check to make sure everything is installed properly usually results in a quick fix. In System 7 and

above, the easiest way to make sure the different components wind up in the right place is to simply drag each item on top of the System Folder icon; the System places things where they need to be for you. Remember not to drag a folder on top of the System Folder; the items inside are not moved to where they need to be.

Viewing Your Fonts

To see what fonts you have installed:

- For versions of System 6, use the Font/DA Mover.
- For versions of System 7 before 7.1, double-click the System file to open it as you would any other file.
- For system software version 7.1, open the Fonts folder within the System Folder.

If you have a version of System 7, you can see samples of the fonts. Double-click the font file, and a window appears displaying the font.

This article is one of many available through the Apple Fax center. For a complete list of available fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature). The Apple Fax center is available free of charge 24 hours a day, 7 days a week.

Article Change History:
01 Jul 1996 - Added Fax Doc Word
11 Oct 1994 - Added keyword as well as additional information.
30 Sep 1994 - Removed reference to an image of a font suitcase.
09 Feb 1994 - Retitled and edited.

DAL Server for AS/400: 90-Day Evaluation Procedure (3/93)

==========

Article Created: 18 March 1993

TOPIC ----------

How can I get a 90-day evaluation of DAL Server for AS/400?

DISCUSSION ----------

There is a 90-day evaluation program for the AS/400. To apply for an evaluation copy, call 408-974-2320 (ESD Licensing), leaving your name and address. You should then be sent an evaluation agreement and when the signed agreement is received by ESD Licensing, the evaluation product will be shipped. The product numbers are:

- B1230LL/A for the 1/4 inch cartridge
- B1238LL/A for the 9-track reel

Manuals for DAL Server for AS/400 are available from APDA for a fee.

DAL Server For AS/400: Pricing Basis For Server (3/93)

==========

Article Created: 18 March 1993

TOPIC ----------

Is the pricing based on concurrent users on the DAL Server or number of Hosts with DAL client installed?

DISCUSSION ----------

Pricing for the server is based on the number of simultaneous client connections. There are three sizes:

- 1 to 8 users
- 1 to 32 users
- over 32 users

The cost of the client varies by the number of clients purchased. You must also purchase a separate DAL client product, version 1.3.7, for each user's Macintosh. This is not the Developer's Toolkit product, but is a separate, less expensive client product that includes the Client, the DAL Tester, the Network Adapters, and an installation manual for information on client network connections.

Macintosh: Compressed Archives and Error -39 (4/93)

Revised: 4/6/93
Security: Everyone

Macintosh: Compressed Archives and Error -39 (4/93)

==========

Article Created: 1 April 1993

TOPIC ----------

I was trying to open a file that was compressed with DiskDoubler as a self-extracting archive. I got error -39. Why?

DISCUSSION ----------

The problem is not necessarily associated with DiskDoubler. When extracting compressed archives, make sure you have enough room on your hard disk. Unfortunately, applications do not always display an error message when needed because of an application problem or extension conflict.

If you have enough space on the hard disk, try downloading the file again. The archive may have been damaged during transfer. It is also possible that the file was defective when compressed. You may want to contact the individual or group that originally compressed the file.

DAL Server for AS/400: How Much Storage is Needed (3/93)

Revised: 4/6/93
Security: Everyone

DAL Server for AS/400: How Much Storage is Needed (3/93)

==========

Article Created: 18 March 1993

TOPIC ----------

What is the minimum RAM and DASD requirement for the DAL Server for AS/400? Is SQL/400 a must for it to work?

DISCUSSION ----------

RAM is determined by the partition of the Interactive Subsystem of the AS/400, the DAL Server will swap in and out of RAM. The storage requirement on the AS/400 is approximately 3MB of DASD for the DAL Server installation and the demo library.

The SQL/400 licensed product is NOT a must. The run-time portion of SQL/400 that is shipped as part of OS/400 is sufficient for DAL operation. However, if you wish to exercise better maintenance control over database files (update), then we recommended you purchase the IBM-supplied SQL/400 licensed program.

APPC connectivity on the AS/400 side is also required, as the only connection method for this server is a SNA•ps APPC gateway.

AppleShare 3.0.1: PrintServer and LaserWriter Pro (4/93)

==========

Article Created: 6 April 1993

TOPIC ----------

After capturing a LaserWriter Pro using AppleShare PrintServer 3.0.1, I tried to select the LaserWriter (via the Chooser) to "Setup" the paper source (trays).

This did not work. The LaserWriter Pro appears as "unknown" and the only option is to choose "Cancel". How do I obtain access to the paper trays? I'm using the 7.2 printer driver. Is there a workaround?

DISCUSSION ----------

The solution is on the client side. Open the Chooser and select the print spooler. You must then do a manual Setup by holding down the Option key and clicking Setup in the Chooser dialog box. This will display a list of printers and options associated with those printers.

Once the Setup is complete, you can select different paper trays.

A/UX 3.0: FileSharing Shows Incorrect Volume Size (4/95)

Revised: 4/26/95
Security: Everyone

A/UX 3.0: FileSharing Shows Incorrect Volume Size (4/95)

==========

Article Created: 5 April 1993
Article Reviewed/Updated: 26 April 1995

TOPIC ----------

I'm running A/UX 3.0 on a Quadra 950 with 16MB of RAM and a 600MB internal hard drive. I currently have 375MB free on slice 0 and 90MB in use. I did a df -B command and its number matches with the finder.

Whenever a user connects to this A/UX machine with personal file sharing either as a user, or owner the finder says there is 1MB free and 17MB in use on this volume. I got the same result from other client machines. The client machines are running System 7.1 and are primarily Quadra 700s.

What is causing the discrepancy? Is there a fix to this problem? This isn't an issue of having several partitions mounted under "/" since the df -B command does show that 375MB are free on slice 0.

At one point I loaded AppleShare 3.0 on the A/UX machine and found it wasn't compatible. I then removed the AppleShare software but never reinstalled A/UX. Everything seemed to be running until recently.

DISCUSSION ----------

We were able to duplicate the problem. In A/UX 3.0, the root / volume shows 99.6MB in disk with 18MB available. A Mac OS client sharing the A/UX root / volume shows 35.7MB in disk and 18MB available.

This is a known bug in the File Sharing version used in A/UX 3.0: A/UX volume shows incorrect size on the client using File Sharing. It is currently being analyzed.

Article Change History:
26 Apr 1995 - Made correction of typographical errors.

Gupta SQLbase and Macintosh Client Access (4/93)

==========

Article Created: 6 April 1993

TOPIC ----------

Is there a way to permit Macintosh clients using an application and/or DAL Server to access and use a database on SQLbase, from Gupta running as NLM on Novell Netware 3.11?

DISCUSSION ----------

Novell told us that their DAL for Netware SQL only supports their own Btrieve database, and no other SQL databases running on their Netware server.

Gupta told us that there is no current Macintosh client access to SQLbase. There is some discussion about Macintosh clients but they don't have any plans as yet.

LaserWriter Select 310: No GrayShare Support (4/96)

Revised: 4/12/96
Security: Everyone

LaserWriter Select 310: No GrayShare Support (4/96)

==========

Article Created: 8 April 1993
Article Reviewed/Updated: 12 April 1996

TOPIC ----------

Will Apple support GrayShare technology in the LaserWriter Select 310?

DISCUSSION ----------

There are currently no plans to provide "sharing" functionality for the LaserWriter Select 310. Since GrayShare was designed for QuickDraw-based printers, it does not support the LaserWriter Select 310. Using QuickDraw GX you can use the LaserWriter GX driver. This allows you to use the LaserWriter Select 310 on more than one Macintosh computer. However, anyone on the network who wants to print to the LaserWriter Select 310 must use QuickDraw GX. If QuickDraw GX is not used, it can only be used as a single-use serial PostScript printer.

Article Change History:
12 Apr 1996 - Added QuickDraw GX solution.

SNA•ps Gateway and LAN Routing Services (4/93)

Revised: 4/13/93
Security: Everyone

SNA•ps Gateway and LAN Routing Services (4/93)

==========

Article Created: 7 April 1993

TOPIC ----------

I'm confused about the appropriate time to use a router with a SNA•ps Gateway. Here are some examples to help explain my question:

- If I'm using s SNA•ps gateway with a Coax/Twinax card or Serial NuBus card and then distributing those sessions to an attached network with either LocalTalk, Ethernet, or Token Ring, I don't need a router.

- Now if I have a SNA•ps gateway running on a Token Ring card, is a router needed to distribute SNA sessions via TokenTalk as well as LocalTalk on the same gateway system?

- What if I utilize a system with Ethernet, LocalTalk, and Token Ring on the SNA•ps Gateway system. Can I distribute SNA sessions over all three?

Since SNA•ps is an AppleTalk to SNA gateway, and is at a higher level on the OSI model than a router, does that negate my need for a router on a system using a Token Ring Card and distributing sessions over Ethernet?

DISCUSSION ----------

Any SNA•ps gateway (Coax, Token Ring, or SDLC) can distribute SNA traffic to clients on AppleTalk networks. The Macintosh performing the gateway function can distribute AppleTalk traffic to only one physical network type, at a time, as defined by the Network Control panel in the gateway machine. Perhaps a table of connections will help:

Gateway type	Physical LAN	Network Control Panel
COAX	LocalTalk	Built-in
COAX	Ethernet	EtherTalk

COAX	Token Ring	TokenTalk
SDLC (Serial)	LocalTalk	Built-in
SDLC	Ethernet	EtherTalk
SDLC	Token Ring	TokenTalk
Token Ring	LocalTalk	Built-in
Token Ring	Ethernet	EtherTalk
Token Ring	Token Ring	TokenTalk

In all the environments listed above, you do NOT need a router! The only confusing one is Token Ring for SNA and TokenTalk for AppleTalk. Both protocols are running on the Token Ring card at the same time. Still no router needed.

If you have a LAN environment with multiple physical environments (LocalTalk, Ethernet, and Token Ring), then the gateway machine will determine the initial physical LAN type for AppleTalk client distribution. You will need a router to get the traffic to other physical LAN types in this case.

You may have routers in just one LAN type for all the reasons you need routers, to break-up large networks to improve performance.

In reality, an SNA gateway is really the combination of an SNA controller and a special purpose router. It does not use the OSI model (it is SNA) and it is not at a "higher level" than a router.

PowerBook Duo Dock and 3COM EtherLink NB Card (4/93)

Revised: 7/7/94
Security: Everyone

PowerBook Duo Dock and 3COM EtherLink NB Card (4/93)

==========

Article Created: 7 April 1993

TOPIC ----------

I have tried to install two different 3COM EtherLink NB REV E cards in a Duo Dock we are using for demonstrations. We have used these cards in the past in a Macintosh IIfx and Macintosh IIci without problems. After the cards were installed (very tight fit, but everything seated properly), and EtherLink network drivers were installed, the card weren't recognized. We put the cards back in the Macintosh IIfx and Macintosh IIci and everything was OK.

After checking with 3COM I learned they haven't tested their card in the Duo Dock. They said it's the same part and version number as the Apple EtherTalk NB card, and it should function the same as the Apple card. Are there any reports of the Apple EtherTalk NB card having problems with the Duo Dock?

We are using the network EtherTalk drivers that come with System 7.1. We also have not encountered any other problems with the Duo and Duo Dock; it has been in use for about two months.

DISCUSSION ----------

Apple does not support the use of the EtherTalk NB card in the Duo Dock. The main reason is a physical incompatibility: it doesn't fit in the machine without modification (one of the AUI posts catches the edge of the rear opening, which prevents the Dock from being reassembled). Because of this, the driver software was not tested.

We verified the physical incompatibility here at our labs this morning.

We also tried the newer Apple Ethernet NB card and it installs easily into the Duo Dock and works perfectly.

Our recommendation is to try a different type of Ethernet card. The 3COM EtherLink card and the Apple EtherTalk NB card appear to be incompatible with

the Duo Dock.

Centris 650 & Macintosh IIci: SCSI Differences (7/94)

Revised: 7/28/94
Security: Everyone

Centris 650 & Macintosh IIci: SCSI Differences (7/94)

==========

Article Created: 16 April 1993
Article Reviewed/Updated: 28 July 1994

TOPIC ----------

How different is the SCSI implementation on the Centris 650, as opposed to the Macintosh IIci? Are there any inconsistencies that could lead to bus errors?

The information in this article relative to the Centris 650 is also relevant to the Quadra 650.

RESPONSE ----------

The major differences between the SCSI implementation on a Macintosh IIci and a Centris 650 are: the Centris 650 utilizes a different SCSI controller (same as the Quadra 700), and uses an active SCSI termination scheme which is automatically enabled depending on the state of the SCSI bus termination.

Though the SCSI controller is different, the Centris 650 utilizes the same SCSI Toolbox routines as the Macintosh IIci, so its SCSI implementation is backward compatible.

Article Change History:
28 Jul 1994 - Added reference to Quadra 650 to aid in searching.

Macintosh Plus: 120ns SIMMs (4/93)

==========

Article Created: 7 April 1993

Article Change History

04/07/93 - REWROTE
- Separated this information from a previous, unrelated article.

TOPIC ----------

The Macintosh Plus came with Apple-labelled DIP SIMMs silk-screened as being for Macintosh Plus or Macintosh SE only, rated at 120ns. I understand that DIP SIMMs are not to be used for upgrades on Macintosh Plus and Macintosh SE systems because of space constraints for hardware additions. But why are 120ns SIMMs unacceptable for Macintosh II computers, since that is the nominal rating for the ones Apple ships in production Macintosh II computers?

DISCUSSION ----------

The SIMMs you are referring to are for finished goods systems only and are not included in any memory expansion kits. These SIMMs will either be 150ns or 120ns and have a different refreshing scheme (RAS before CAS) than what is supported by the Macintosh II (CAS before RAS). This is why the silk-screening identifies these SIMMs as for the Macintosh Plus and Macintosh SE only.

These SIMMs will fit in all four SIMM positions in the Macintosh Plus and in SIMM positions 3 and 4 of the Macintosh SE.

The 120ns version of these SIMMs work properly in the Macintosh SE/30, Macintosh IIx, and Macintosh IIcx.

Centris 610: 3197 and 3178c Terminal Emulation (4/93)

Revised: 4/13/93
Security: Everyone

Centris 610: 3197 and 3178c Terminal Emulation (4/93)

==========

Article Created: 8 April 1993

TOPIC ----------

I need to connect my Centris 610 to a mainframe that emulates a 3197 and 3178c Terminals. What software or hardware solutions would achieve this?

DISCUSSION ----------

We will separate this question into two parts:

1) The 3197 and 3178 emulation issue

2) The Centris 610 issue

1) The 3197 terminal shows up primarily on IBM midrange systems so any 5250 style emulation will do the trick. As of April, 1993, two 5250 emulation products are available: Andrew's MacMidrange products, and IDEAssociates' IDEACom Mac products. In June, 1993, Apple's SNA•ps 5250 product, which connects only to AS/400s over APPC SNA•ps gateways, will be available. If you have System 38s or 36s, be sure the midrange product you choose supports them. There may be a model of 3197 which emulates a 3270-style terminal. If that is the case, then include the 3197 in the discussion of 3270 emulations below.

   The 3178c terminal is a color terminal in the 3270 family. Any Macintosh 3270 emulation will support this terminal type. The vendors are:

   a) Apple with SNA•ps 3270
   b) DCA with MacIRMA, MacMainFrame, and Netway
   c) AttachMate with EXTRA! for the Macintosh
   d) Netware for SAA for the Macintosh

All the products listed above primarily use the client-server relationship to connect Macintoshes to IBM mainframe or midrange machines. The server types cover a multitude of hardware solutions from special Twinax cards (in Macintosh), APPC gateways on Token Ring or SDLC (in Macintosh), 3270 gateways on Coax, Token Ring, or SDLC cards (in Macintosh), 3270 solutions in stand alone SPARC based hardware (Netway), and 486 PC based gateways (DCA IRMALan, AttachMate and Netware for SAA).

There are also standalone solutions which generally require the installation of a NuBus card in a NuBus slot in the Macintosh. There are coax, Token Ring, and SDLC based standalone solutions which use NuBus cards.

2) The Centris 610 has some special issues. The NuBus slot only allows a 7 inch long card. This eliminates ALL currently available stand alone solutions since all available Coax, Token Ring, or SDLC cards are longer than 7 inches and do not fit in the Centris 610. So you have to use the client-server or distributed session products to do all emulations. The Centris 610 has built-in LocalTalk and can accept the Apple Ethernet NB card and other vendor's Ethernet cards since they are all within the Centris 610 7 inch NuBus limitations. There are NO Token Ring cards available from any vendor which fit into the Centris 610.

Summary

The Centris 610 can only be connected to larger IBM machines via terminal emulation using gateways with emulation data streams delivered via AppleTalk. The only physical connections offered are LocalTalk and Ethernet. 3197 emulation is generally a 5250 vendor offering and 3178 emulation is a 3270 vendor offering. If the customer wants a standalone solution, another Macintosh computer should be selected (capable of accepting Coax, Token Ring, or SDLC cards).

To get more background on these solutions, refer to the Apple Network Solutions guide, 1992 edition, published by the MZ Group in San Francisco. Read from page 165 and beyond about Communication Services.

To locate a vendor's address and phone number, use the vendor name as a search string.

AppleShare Print Server 3.0.1 & Retrospect 1.3 (8/93)

Revised: 8/27/93
Security: Everyone

AppleShare Print Server 3.0.1 & Retrospect 1.3 (8/93)

==========

Article Created: 8 April 1993
Article Reviewed/Updated: 27 August 1993

TOPIC ----------

Are there any reported problems when the Retrospect Application 1.3 and AppleShare Print Server 3.0.1 run on the same Macintosh?

DISCUSSION ----------

Crashes and "unexpectedly quit" errors have been reported where the Retrospect Application is running on the same computer as the print server.

The solution is to use the AppleShare 3.0.2 Patch Program to update AppleShare 3.0 or 3.0.1 file and print servers to version 3.0.2. The AppleShare 3.0.2 Patch Program is available directly from Apple or on AppleLink in the following path:

Software Sampler
 Apple SW Updates
  Macintosh
   Networking & Communications
    AppleShare 3.0.2 Patch Program

To locate Dantz's address and phone number, use Dantz as a search string.

Article Change History:
27 August 1993 - Revised article with AppleShare 3.0.2 patch solution.

AppleCD 300: Recording Sounds From an Audio CD (7/93)

Revised: 7/16/93
Security: Everyone

AppleCD 300: Recording Sounds From an Audio CD (7/93)

==========

Article Created: 13 April 1993
Article Reviewed/Updated: 13 July 1993

TOPIC ----------

I have some questions about recording sounds from CDs.

1) How can I record sounds directly from a CD on the Centris
   and the Quadra 800 computers?

2) With the Macintosh IIvx (Performa 600CD) and IIvi, I was surprised that I
   had to record from the CD and the microphone at the same time. The "Options"
   button in the Sound control panel was always disabled. Why? The
   Quadra 950 and the Color Classic both have and use their "Options"
   button. Can you explain this?

DISCUSSION ----------

1) You can record sound from an audio CD. The Macintosh IIvx and IIvi,
   Centris 610 and 650, and Quadra 800 allow an audio CD (in the built-in
   CD-ROM player) to output sound to the built-in speaker. The key is to
   unplug the microphone from the computer.

   If an audio CD-ROM is playing and a microphone is plugged in, you are
   able to record the audio output since the audio will play through the
   built-in speaker. The microphone picks up this sound as input, along
   with other ambient sounds. Also, if the microphone is plugged in via
   the ports on a monitor, such as the Macintosh 16" Color Display, then
   the cable that plugs into the computer must be unplugged. Unplugging the
   microphone at the monitor is not sufficient.

   Again, if you want to record from the CD, unplug the microphone from
   the computer. If you do not want music included in a recording while using
   the microphone, don't play a CD.

2) The Options button is grayed out because the sound circuitry on these

systems (Macintosh IIvx and IIvi) is less sophisticated than the Quadra 950's. The Quadra 950 allows the input source to be selected from software.

When a microphone is plugged into the other systems, the input defaults to the microphone due to the internal connections that are made. When no microphone is plugged in, then the sound input is from the CD.

Article Change History:
07/13/93 - Revised to include Performa 600CD.

System 7.1: Damaged Font Suitcase Message (7/96)

Revised: 7/1/96
Security: Everyone

System 7.1: Damaged Font Suitcase Message (7/96)

==========

Article Created: 9 April 1993
Article Reviewed/Updated: 1 July 1996

TOPIC

This article tells you what to do when you try to open or remove a font suitcase file, and the Macintosh displays a message saying that the font suitcase is damaged.

If you try to move the damaged font suitcase from the Fonts folder to the Trash or to another folder, the Macintosh returns a System error. The System 7.1 Finder doesn't allow moving or deleting some damaged font files from the active Fonts folder.

DISCUSSION

TESTING AND REMOVING A DAMAGED SUITCASE

To test a font suitcase file to see whether it's damaged, double-click on the font suitcase to open it. If you can open the suitcase, it probably isn't damaged. If you can't open the suitcase (receive a system error typically -39 or "Command could not be completed because the file is damaged."), here's how to remove it from the Fonts folder:

1) Move the Fonts folder to the desktop.

2) Create a new Fonts folder in the System Folder.

3) Drag the known good Fonts from the desktop Fonts folder to the newly created Fonts folder.

4) Restart the Macintosh.

5) Drag the Fonts folder on the desktop, with the corrupted font suitcase, to the Trash.

6) Drag a "good" copy of the corrupted font suitcase from a backup copy or from the original font disk to the closed System Folder.

REASONS THE SYSTEM IDENTIFIES A SUITCASE AS DAMAGED

Name Longer Than 31 Characters

System 7 considers a font damaged if its name is longer than 31 characters. System 6 allowed fonts to have longer names, but System 7 doesn't. You should contact the font vendor and request a System 7-compatible version of the font.

(The Finder has always limited file names to a maximum of 31 characters. System 6 fonts couldn't exist as files on the desktop. System 7 allows fonts to exist in suitcases, like System 6 and earlier, or as individual files on the desktop. But since the Finder doesn't allow font names longer than 31 characters, it treats these fonts as damaged.)

Compressed by Third-Party Utility

System 7.1 reports fonts as damaged if a third-party font compression utility (such as Font & Sound Valet, included with Suitcase from Fifth Generation Systems, Inc.) compressed the font. Versions of Font & Sound Valet before 1.3 create suitcases that appear damaged in System 7.1.

To fix a damaged suitcase, decompress the suitcase with the proper utility and open the suitcase to test if the suitcase is damaged. If you have Font & Sound Valet, use version 1.3 or later to decompress the font suitcase. Otherwise, reinstall the original uncompressed font suitcase.

Performa 400 and 600 Series: Overview and Differences (4/93)

Revised: 7/12/93
Security: Everyone

Performa 400 and 600 Series: Overview and Differences (4/93)

==========

Article Created: 12 April 1993

Article Change History

07/09/93 - REVISED
- To include Macintosh equivalents

TOPIC ----------

What are the differences between the Performa 405 and 430, and between the Performa 430 and 450? And how do they compare with the Performa 600 and 600CD?

DISCUSSION ----------

What the Performa 405, 430, and 450 Have in Common

- Complete system. The computer (the main unit), color display (monitor), keyboard, mouse, fax/data modem, microphone, and software are all included. You need no additional software or cables to begin using a Performa 405, 430, or 450. In addition, these models are packed in a single box: computer, display, and accessories all in one carton.

- Ease of use. Like all Apple Macintosh computers, these Performa models are easy to set up, learn, and use.

- Software already installed. All three models feature System 7.1P, disability access features, At Ease, Macintosh PC Exchange, Launcher, and a selection of productivity and communication software.

- Compatibility. Each of these Performa models has a built-in SuperDrive, which can read disks from Macintosh, Apple II, MS-DOS, and Windows computers. AppleTalk is built in to every model.

- Service & Support. All three models feature one year limited warranty, one year free in-home service, and a toll-free help line.

How They Differ

The following table summarizes the differences among the three models, as well as the Performa 400, 600, and 600CD.

	400	405	430	450	600	600CD
Processor	68030	68030	68030	68030	68030	68030
Clock speed	16 MHz	16 MHz	16 MHz	25 MHz	32 MHz	32 MHz
FPU Socket	No	No	No	Yes	Yes	Yes
Std. RAM	4MB	4MB	4MB	4MB	4MB	5MB
Max. RAM	10MB	10MB	10MB	36MB	68MB	68MB
Std. Hard Drive	80MB	80MB	120MB	120MB	160MB	160MB
Display	Separate	Included	Included	Included	Separate	Separate
VRAM	512K	256K	512K	512K	512K	1MB
Colors	256	16	256	256	256	32,000
Dot Pitch	.39mm/.29mm	.39mm	.39mm	.29mm	.29mm	.29mm
Slots	1 PDS	1 PDS	1 PDS	1 PDS	1 PDS & 3 NuBus	1 PDS & 3 NuBus
Keyboard	Standard	Standard	Standard	Standard	Extended	Extended

NOTE: Performa 400 = Macintosh LC II with 512K video RAM.
Performa 405 = Macintosh LC II with an external modem.
Performa 430 = Macintosh LC II with 512K video RAM and external modem.
Performa 450 = Macintosh LC III with an external modem.
Performa 600 = Macintosh IIvx without the 68882 math coprocessor.

Performa 405: Specifications (7/94)

Revised: 7/26/94
Security: Everyone

Performa 405: Specifications (7/94)

==========

Article Created: 12 April 1993
Article Reviewed/Updated: 26 July 1994

TOPIC ----------

This article provides technical specifications for the Macintosh Performa 405 computer.

DISCUSSION ----------

Microprocessor

- MC68030, 32-bit architecture, 16 MHz clock speed
- CMOS custom clock/calendar with long-life lithium battery

Memory

- 4MB RAM on logic board, expandable to 10MB via two SIMM slots
- 256K Video RAM (VRAM) for 16 colors on the Apple Performa Display
  VRAM expandable to 256 colors

Video Display

- Apple Performa Display standard:
  - 14-inch color display
  - 640 x 480 pixels
  - 0.39mm dot pitch
  - Meets international magnetic-field emissions guidelines (SWEDAC MPR2)

Storage

- One internal SuperDrive 1.4MB high-density floppy-disk drive, reads disks from Macintosh, Apple II, MS-DOS, and Windows systems
- One internal 80MB SCSI hard disk drive
- Optional external SCSI hard disk drive (many capacities available)

- Optional external AppleCD CD-ROM drive

Modem

- TelePort/Bronze for Macintosh Performa
  (from Global Village Communication, Inc.)
- GlobalFax software (send-only fax) for 9600-baud faxing from any application
  to fax machines worldwide (upgradable to receive fax via software)
- Modem also serves as 300/1200/2400-baud data modem
- No separate power adapter required

Power Input

- Line voltage: 90 to 240 volts AC, RMS automatically configured
- Frequency: 47 to 63 Hz single phase
- Power: 50 watts maximum, not including display power

Interfaces

- One Apple Desktop Bus (ADB) port supports a keyboard, mouse, and other
  devices daisy-chained through a low-speed, synchronous serial bus
- Two serial (RS-232/RS-422) ports, 230 kilobits per second maximum
  (up to 0.920 megabits per second if clocked externally)
- SCSI interface for connecting up to six external devices
- Video port supports RGB and monochrome monitors of various sizes and
  resolutions
- Sound output port capable of delivering monophonic sound to both
  channels of a stereo device
- Sound input port for monaural sound input (monaural 8-bit sound, sampled
  at 22 or 11 kHz)
- Internal expansion slot for one processor-direct expansion card

Keyboard and Mouse

- Apple Desktop Bus (ADB) keyboard with numeric keypad and two-level tilt
  adjustment
- Apple ADB Mouse II

Apple Desktop Bus Power Requirements

- Maximum current draw for all ADB devices: 200 milliamperes (mA)
- Recommended maximum of three ADB devices
- Mouse draws 10 mA
- Keyboard draws 25 mA

Microphone

- Hands-free omnidirectional electret microphone included

Sound Generator

Custom sound chip, including mono sampling generator capable of driving stereo
miniature phone jack headphones, or stereo equipment by sending the same output

into each channel.

Software

- Macintosh System Software version 7.1P, designed specifically for Performa computers.
- At Ease software lets adults share the computer with children -- while protecting valuable data.
- Macintosh PC Exchange lets you work with MS-DOS and Windows disks.
- Application software: a selection of productivity and communication tools already installed on the hard drive.

Disability Access

- CloseView, Easy Access, and "visible beep" software are built in.
- Third-party options provide other alternative input and output devices

Size and Weight

- Main Unit
  Weight: 8.8 lb. (4.0 kg)
  Height: 3.0 inches (77 mm)
  Width: 12.2 inches (310 mm)
  Depth: 15.0 inches (382 mm)
- Mouse
  Weight: 6 oz. (0.17 kg)
  Height: 1.1 inches (27.9 mm)
  Width: 2.1 inches (53.3 mm)
  Depth: 3.8 inches (96.5 mm)
- Keyboard
  Weight: 2 lb. (1 kg)
  Height: 1.8 inches (44 mm)
  Width: 16.5 inches (418 mm)
  Depth: 5.6 inches (142 mm)

Environment

- Operating temperature: 10 to 40° C (50 to 104° F)
- Storage temperature: -40 to 47° C (-40 to 116.6° F)
- Relative humidity: 20% to 80% (noncondensing)
- Maximum altitude: 3048 m (10,000 ft.)

Security: Everyone

Performa 430: Specifications (7/94)

==========

Article Created: 12 April 1993
Article Reviewed/Updated: 26 July 1994

TOPIC ----------

This article provides technical specifications for the Macintosh Performa 430 computer.

DISCUSSION ----------

Microprocessor

- MC68030, 32-bit architecture, 16 MHz clock speed
- CMOS custom clock/calendar with long-life lithium battery

Memory

- 4MB RAM on logic board, expandable to 10MB via two SIMM slots
- 512K Video RAM (VRAM) for 256 colors on the Apple Performa Display

Video Display

- Apple Performa Display standard:
  - 14-inch color display
  - 640 x 480 pixels
  - 0.39mm dot pitch
  - Meets international magnetic-field emissions guidelines (SWEDAC MPR2)

Storage

- One internal SuperDrive 1.4MB high-density floppy-disk drive, reads disks from Macintosh, Apple II, MS-DOS, and Windows systems
- One internal 120MB SCSI hard disk drive
- Optional external SCSI hard disk drive (many capacities available)
- Optional external AppleCD CD-ROM drive

Modem

- TelePort/Bronze for Macintosh Performa
  (from Global Village Communication, Inc.)
- GlobalFax software (send-only fax) for 9600-baud faxing from any application to fax machines worldwide (upgradable to receive fax via software)
- Modem also serves as 300/1200/2400-baud data modem
- No separate power adapter required

Power Input

- Line voltage: 90 to 240 volts AC, RMS automatically configured
- Frequency: 47 to 63 Hz single phase
- Power: 50 watts maximum, not including display power

Interfaces

- One Apple Desktop Bus (ADB) port supports a keyboard, mouse, and other devices daisy-chained through a low-speed, synchronous serial bus
- Two serial (RS-232/RS-422) ports, 230 kilobits per second maximum (up to 0.920 megabits per second if clocked externally)
- SCSI interface for connecting up to six external devices
- Video port supports RGB and monochrome monitors of various sizes and resolutions
- Sound output port capable of delivering monophonic sound to both channels of a stereo device
- Sound input port for monaural sound input (monaural 8-bit sound, sampled at 22 or 11 kHz)
- Internal expansion slot for one processor-direct expansion card

Keyboard and Mouse

- Apple Desktop Bus (ADB) keyboard with numeric keypad and two-level tilt adjustment
- Apple ADB Mouse II

Apple Desktop Bus Power Requirements

- Maximum current draw for all ADB devices: 200 milliamperes (mA)
- Recommended maximum of three ADB devices
- Mouse draws 10 mA
- Keyboard draws 25 mA

Microphone

- Hands-free omnidirectional electret microphone included

Sound Generator

Custom sound chip, including mono sampling generator capable of driving stereo miniature phone jack headphones, or stereo equipment by sending the same output into each channel.

Software

- Macintosh System Software version 7.1P, designed specifically for Performa computers.
- At Ease software lets adults share the computer with children -- while protecting valuable data.
- Macintosh PC Exchange lets you work with MS-DOS and Windows disks.
- Application software: a selection of productivity and communication tools already installed on the hard drive.

Disability Access

- CloseView, Easy Access, and "visible beep" software are built in.
- Third-party options provide other alternative input and output devices

Size and Weight

- Main Unit
  Weight: 8.8 lb. (4.0 kg)
  Height: 3.0 inches (77 mm)
  Width: 12.2 inches (310 mm)
  Depth: 15.0 inches (382 mm)
- Mouse
  Weight: 6 oz. (0.17 kg)
  Height: 1.1 inches (27.9 mm)
  Width: 2.1 inches (53.3 mm)
  Depth: 3.8 inches (96.5 mm)
- Keyboard
  Weight: 2 lb. (1 kg)
  Height: 1.8 inches (44 mm)
  Width: 16.5 inches (418 mm)
  Depth: 5.6 inches (142 mm)

Environment

- Operating temperature: 10 to 40° C (50 to 104° F)
- Storage temperature: -40 to 47° C (-40 to 116.6° F)
- Relative humidity: 20% to 80% (noncondensing)
- Maximum altitude: 3048 m (10,000 ft.)

Service and Support

- One year limited warranty
- One year free in-home service
- Toll-free help line
- Support for non-Apple software is provided by the respective software publishers.

Performa 450: Specifications (7/95)

==========

Article Created: 12 April 1993
Article Reviewed/Updated: 7 July 1995

TOPIC ----------

This article provides technical specifications for the Macintosh Performa 450 computer.

DISCUSSION ----------

Microprocessor
==========
• MC68030, 32-bit architecture, 25 MHz clock speed
• Socket for optional 68882 FPU
• CMOS custom clock/calendar with long-life lithium battery

Memory
======
• 4 MB RAM on logic board, expandable to 36 MB via one 72-pin SIMM slot
• 512K Video RAM (VRAM) for 256 colors on the Apple Performa PLUS Display.
. VRAM is expandable to 768K for 32,000 colors.

Video Display
==========
• Apple Performa Plus Display standard:
. - 14-inch color display
. - 640 x 480 pixels
. - 0.29mm dot pitch
. - Meets international magnetic-field emissions guidelines
. (SWEDAC MPR2)

Storage
=======
• One internal SuperDrive 1.4 MB high-density floppy-disk drive, reads disks
. from Macintosh, Apple II, MS-DOS, and Windows systems
• One internal 120MB SCSI hard disk drive

• Optional external SCSI hard disk drive (many capacities available)
• Optional external AppleCD CD-ROM drive

Modem

• TelePort/Bronze for Macintosh Performa
. (from Global Village Communication, Inc.)
• GlobalFax software (send-only fax) for 9600-baud faxing from any application
. to fax machines worldwide (upgradable to receive fax via software)
• Modem also serves as 300/1200/2400-baud data modem
• No separate power adapter required

Power Input

• Line voltage: 90 to 240 volts AC, RMS automatically configured
• Frequency: 47 to 63 Hz single phase
• Power: 50 watts maximum, not including display power

Interfaces

• One Apple Desktop Bus (ADB) port supports a keyboard, mouse, and other
. devices daisy-chained through a low-speed, synchronous serial bus
• Two serial (RS-232/RS-422) ports, 230 kilobits per second maximum
. (up to 0.920 megabits per second if clocked externally)
• SCSI interface for connecting up to six external devices
• Video port supports RGB and monochrome monitors of various sizes and
. resolutions
• Sound output port capable of delivering monophonic sound to both
. channels of a stereo device
• Sound input port for monaural sound input
. (monaural 8-bit sound, sampled at 22 or 11 kHz)
• Internal expansion slot for one processor-direct expansion card

Keyboard and Mouse

• Apple Desktop Bus (ADB) keyboard with numeric keypad and two-level tilt
. adjustment
• Apple ADB Mouse II

Apple Desktop Bus Power Requirements

• Maximum current draw for all ADB devices: 200 milliamperes (mA)
• Recommended maximum of three ADB devices
• Mouse draws 10 mA
• Keyboard draws 25 mA

Microphone

• Hands-free omnidirectional electret microphone included

Sound Generator

Custom sound chip, including mono sampling generator capable of driving stereo miniature phone jack headphones, or stereo equipment by sending the same output into each channel.

Software

- Macintosh System Software version 7.1P, designed specifically for Performa computers.
- At Ease software lets adults share the computer with children -- while protecting valuable data.
- Macintosh PC Exchange lets you work with MS-DOS and Windows disks.
- Application software: a selection of productivity and communication tools already installed on the hard drive.

LaserWriter Pro: Lower Rollers Before Printing (4/93)

Revised: 4/16/93
Security: Everyone

LaserWriter Pro: Lower Rollers Before Printing (4/93)

==========

Article Created: 9 April 1993

TOPIC ----------

This article describes how to make a new LaserWriter Pro ready for printing by lowering the fuser pressure rollers.

DISCUSSION ----------

All LaserWriter Pro printers are shipped from the factory with their fuser pressure rollers in the up position to prevent fuser rollers from developing flat spots during long-term storage. The fuser rollers must be lowered before printing to ensure good print quality. If you print to the LaserWriter Pro with its fuser rollers raised in their shipping position, the toner on your documents will not fuse properly and may easily be scraped or wiped from your documents.

To lower the fuser pressure rollers:

1) Open the fuser assembly doors on the left side of the printer and remove the packing materials.

2) Locate the fuser assembly levers located on either side of the metal frame that supports the lower fuser roller.

3) Lower the fuser assembly levers (you will have to push firmly) all the way to the bottom of their travel.

4) Close the fuser assembly doors and begin printing.

This procedure is also described and illustrated on page 6 of the LaserWriter Pro User's Guide.

A/UX 3.0: Secure Startup and auxstartuprc (4/93)

Revised: 4/16/93
Security: Everyone

A/UX 3.0: Secure Startup and auxstartuprc (4/93)

==========

Article Created: 8 April 1993

TOPIC ----------

A/UX 3.0 Macintosh partition doesn't show on the desktop when logged in as anything but the root. I went into the startup shell, as it says to do in the TIL article, and the password check option was already off. When we rebooted A/UX and logged in as a user we still couldn't see the Macintosh partition.

Is there somewhere else that might be storing this bit or is there some preferences file we could throw away?

DISCUSSION ----------

The problem might be the existence of the /etc/auxstartuprc file in the system.

According to the manual pages of auxstartuprc(4), "whether the /etc/auxstartuprc file is empty or not, and whether A/UX Startup has Password checking disabled or not, the EXISTENCE of /etc/auxstartuprc causes the A/UX Finder to suppress the display of a desktop icon for the Macintosh volume residing on the root disk, for normal users except the 'root' account."

If the /etc/auxstartuprc exists and is EMPTY, and Password checking in A/UX Startup is disabled, the /etc/auxstartuprc file will automatically be removed by A/UX Startup. If the Password checking is enabled, the empty /etc/auxstartuprc file will be re-created.

Note that a non-empty /etc/auxstartuprc file will never be removed by A/UX Startup even if the Password checking is disabled.

If you don't need a secure A/UX Startup, and you give any user total access

to A/UX Startup and the Macintosh volume on the root disk, do the following:

- Disable Password checking
- Remove /etc/auxstartuprc, or rename it

See auxstartuprc (4) NOTES for more information.

Language Kits: Language Registers (2/95)

Revised: 2/22/95
Security: Everyone

Language Kits: Language Registers (2/95)

==========

Article Created: 12 April 1993
Article Reviewed/Updated: 22 February 1995

TOPIC -----

This article describes the Japanese Language Register, however, please note that the same applies for the registers that come with the Chinese Language Kit.

DISCUSSION -----

The Japanese Language Register is an application which ships with the Japanese Language Kit. This application is installed in the Apple Extras folder, which is located at the root level of the hard disk drive.

Application programs contain a language and region code that tells the system which script (writing system) and font to use for menus, dialog boxes, help balloons, and other items.

Some programs, however, did not properly set these codes. As a result, some Japanese programs which are launched under the Japanese Language Kit will have menus, dialog boxes, and other text strings which are unreadable.

This problem can be remedied by "registering" these applications with the Japanese Language Register. By either selecting the application through the standard file dialog box or by "dragging and dropping" the application icon to the Japanese Language Register icon, the correct language and region information will be stored in a database found in the Language Kit Preferences file.

Once these applications with unreadable menus are registered, the correct language and region information is used, so text is displayed correctly. Applications only need to be registered once, as long as the Language Kit Preferences file is not lost.

Article Change History:
22 Feb 1995 - Changed article to include all Language Kits.

LaserWriter Pro: Line Frequency and Gray Levels (4/94)

Revised: 4/18/94
Security: Everyone

LaserWriter Pro: Line Frequency and Gray Levels (4/94)

==========

Article Created: 8 April 1993
Article Reviewed/Updated: 18 April 1994

TOPIC ----------

What is the highest line frequency and number of gray levels that the LaserWriter Pro can support (with PhotoGrade) at 300 and 600 DPI?

DISCUSSION ----------

The LaserWriter Pro supports five settings via the LaserWriter Utility 7.4 when PhotoGrade is turned on. Here are the numbers:

Far right:	Frequency: 150 lpi;	Screen Angle: 0 degrees
Middle right:	Frequency: 106 lpi;	Screen Angle: 45 degrees
Center:	Frequency: 83 lpi;	Screen Angle: 56 degrees
Middle left:	Frequency: 75 lpi;	Screen Angle: 0 degrees
Far Left:	Frequency: 53 lpi;	Screen Angle: 45 degrees

Note: lpi = lines per inch.

PhotoGrade at 300 DPI supports 91 gray levels when the frequency is 53 lpi and the screen angle is 45 degrees. In the 600 DPI mode the frequency is 85 lpi and the screen angle is 45 degrees.

PhotoGrade is not available when printing at 600 DPI; however, it is possible to get 33 gray levels at 106 lpi when using PhotoGrade at 300 dpi.

Article Change History:
18 April 1994 - Clarified last statement about gray levels at 106 lpi.

Language Kits: Viewing Files/Folders in Japanese/Chinese (2/95)

Revised: 2/22/95
Security: Everyone

Language Kits: Viewing Files/Folders in Japanese/Chinese (2/95)

==========

Article Created: 12 April 1993
Article Reviewed/Updated: 22 February 1995

TOPIC ----------

How do I display my files and folder names in Japanese or Chinese after installing one of the Language Kits on my Macintosh computer which is running System 7.1 (or higher)?

DISCUSSION ----------

After installing one of the Language Kits on your System 7.1 or higher Macintosh computer, change the Views control panel font to either a Japanese or Chinese font so that file and folder names appear correctly.

The font which is currently selected may not be appropriate for the Language Kits. For example, many people use the Geneva font for file and folder names, but Geneva only contains characters for English and other languages that use the Roman character set (such as French, Spanish, and German).

The Osaka font contains Japanese characters as well as most commonly used Roman characters. Selecting Osaka in the Views control panel will make Japanese filenames readable.

Beijing and Taipei fonts contain Chinese characters as well as the most commonly used Roman characters. Selecting one of these fonts in the Views control panel will make Chinese file and folder names readable.

There is a side effect of choosing a Language Kit font in the Views control panel: certain accented characters and symbols (é and ™) will be replaced by other characters. This occurs because the Language Kit fonts have a different character mapping of the upper ASCII table than Roman fonts.

Article Change History:
22 Feb 1995 - Changed article to include all Language Kits.

Language Kits: Kanji Bitmap Fonts (2/95)

Revised: 2/22/95
Security: Everyone

Language Kits: Kanji Bitmap Fonts (2/95)

==========

Article Created: 12 April 1993
Article Reviewed/Updated: 22 February 1995

TOPIC ----------

This article gives information about Kanji Bitmap fonts.

DISCUSSION ----------

Both the Chinese and Japanese Language Kits include bitmap fonts. The font file icons are identified by the Kanji character "kan" with the circle behind it. They are sometimes referred to as "fbit/fdef" fonts because the font resource is tagged "fbit" and the code necessary to process these fonts were stored as a "fdef" resource.

Typically, each font is divided into two files, L1 and L2. These two files correspond to the Industry Standard Level 1 and Level 2 standard for the Japanese and Chinese character sets. These two font files contain a range of bitmap sizes for that font (for example: 10, 12, 14, 18, 24 points). In some cases, however, each file has only one point size and is appropriately labeled as such.

The InputBackSupport extension provides backwards compatibility with system 6.x (KanjiTalk for example) input methods and fbit/fdef bitmap fonts. Unless this extension is installed, the Kanji bitmap fonts provided with the kits will have garbled characters which typically include black squares.

These fonts must be located at the root level of the system folder, NOT in the Fonts folder. These fonts are not kept in the Fonts folder for compatibility reasons.

Fonts: Terminology (4/93)

Revised: 4/21/93
Security: Everyone

Fonts: Terminology (4/93)

==========

Article Created: 6 April 1993

TOPIC --------------------

When using a TrueType font, Times Roman for instance, and I chose to make it bold, does the printer select a true Times bold font? Or does it just make the plain version bolder?

DISCUSSION --------------------

To work with fonts in your application, you need to understand some basic font definitions. The following definitions are those used in the LaserWriter Reference and Inside Macintosh manuals.

- Intrinsic font: A font whose characteristics are entirely defined in a FONT or NFNT resource. The plain style of any family is an intrinsic font. Other styles may or may not be intrinsic. QuickDraw or the LaserWriter can use an intrinsic font without modification.

- Derived font: A font whose characteristics are partially determined by modifying an intrinsic font. A derived font might be one whose characters are slanted to achieve an italic style.

- Style: The characteristics other than size that uniquely define the fonts of a single font family. Times bold and Times italic are two styles of the Times font family.

Let us assume you are printing some italicized text. The LaserWriter driver may choose an intrinsic font (if available) or modify the intrinsic font to achieve the derived style. For example, Times Italic is an intrinsic font and Avant Garde Book Oblique is a derived font.

VM DAL Server and Non-IBM TCP/IP Connection (4/93)

Revised: 4/16/93
Security: Everyone

VM DAL Server and Non-IBM TCP/IP Connection (4/93)

==========

Article Created: 13 April 1993

TOPIC ----------

I'm working on a project to hook a number of Macintosh computers to an IBM mainframe SQL/DS data base under VM using DAL over TCP/IP. The challenge is the TCP/IP package on the IBM hosts is NOT from IBM but from a company called Fibronics, K2000 KNET TCP/VM.

I have an evaluation copy of the DAL server for VM, and installed it on the host, but the network connection does not work. Installation and verification have been completed successfully at the host side. Now, any virtual machine can select data from SQL using IDAL at the host side. Should these files be copied to any service VM or KNET virtual machine? (KNET/VM is Fibronics software similar to TCP/IP VM). I have no idea if KNET has the necessary socket interface for SQL connection. Would it be necessary to copy DAL Server files to TCP/IP VM, if we would have IBM's TCP/IP software and related hardware?

Here is additional information on the environment:

```
  Host:     IBM 3081
  OS:       VM/SP Release 5, HPO level 50 service level 520
            CMS release 5
  Database: SQL/DS version 2, release 2

  Host:     IBM ES 9000/320
  OS:       VM/ESA release 1.1, service level 0102
            CMS level 8, service level 101
  Database: VSE/SP CICS (MRPII)
```

Network configuration:
- 2 Ethernet
- 2 LocalTalk (connected to Ethernet via FASTPATH)

Mainframe connection:
FIBRONIC K2000 KNET TCP/VM
K2000 controller (Ethernet-IBM) channel attached.

KNET TCP/VM 3.1 is running in KNET VM to manage TCP/IP communication and provide TELNET and FTP services to Macintosh and PC over Ethernet which are using TELNET &FTP

Common protocol:
TCP/IP

DISCUSSION ----------

In answer to your questions:

- The only TCP/IP connection supported by DAL for VM is the "IBM TCP/IP Version 2 for VM" product. (Program Number 5735-FAL) See page 2 of the VM Install Guide, "System Requirements" for required products.

- The DAL product need only be installed on a disk which is accessible to all the users. It does not need to be copied to the TCP/IP Virtual Machine.

- The VM host file would need to be updated to contain the IP addresses of Macintoshes which will be allowed to access the DAL Server via the TCP/IP connection. These addresses will be verified by the REXEC Daemon before the DAL TCP/IP connection is allowed.

Since the IBM product is a requirement for TCP/IP access to the DAL VM Server, we're afraid that you will have to purchase that product to use TCP/IP to access the server. The other 3270 connections (SNA•ps, MacMainFrame, Netway, and so on) would be supported without any additional host requirements.

By the way, there is a difference between VM/SP and VM/ESA systems as related to SQL/DS. VM/SP supports the "connect to database" feature of SQL/DS. VM/XA and VM/ESA do not.

Therefore, for DAL installations in VM/ESA sites, the access module (CL1DBI01) may need to be changed to comment out the "connect to database" commands. Whether this is required is a function of your SQL/DS environment, some sites can prep and assemble the module without having to comment out the commands.

This constraint of the VM/ESA operating system means that the DAL 'Open Database' command needs to reference a special database name that tells DAL not to attempt to issue a "connect to database" SQL command ('@sql'), rather than the actual database name.

This special database name (@sql) should be the only one listed in the Environment File in the SSID= field. Sites with VM/ESA have only a single database name available under SQL/DS, but that name cannot be listed in the

Environment File or DAL will attempt to use it in a "connect to database" command, which will fail.

The format of the DAL 'Open Database' command is:

```
open database '@sql';
```

Rather than:

```
open database 'database name';
```

Which would be used in a VM/SP environment.

A/UX 3.0 and Telnet Receiving Two Mail Notices (4/93)

Revised: 4/16/93
Security: Everyone

A/UX 3.0 and Telnet Receiving Two Mail Notices (4/93)

==========

Article Created: 12 April 1993

TOPIC ----------

I have been receiving two mail notices whenever I connect to A/UX 3.0 with telnet.

DISCUSSION ----------

We looked at the A/UX 3.0 source code and this is what we found:

- The first "You have mail" message, is generated by the process remlogin, which is called by the in.telnetd process when a telnet login is performed.

- The second "You have mail" message is displayed by the initialization scripts during the login sequence. Both /etc/profile and /etc/cshrc check for mail.

Language Kits: Inline Support (2/95)

Revised: 2/15/95
Security: Everyone

Language Kits: Inline Support (2/95)

==========

Article Created: 13 April 1993
Article Reviewed/Updated: 15 February 1995

TOPIC -----

When inputting Japanese or Chinese text into a Japanese or Chinese TeachText document or into the Finder (including control panels) using the Japanese or Chinese Language Kit the text does not show up inline like in KanjiTalk 7. Why not?

DISCUSSION -----

The inline text feature is not available in the Japanese or Chinese Language Kits because the Text Services Manager Text Edit (TSMTE) patches are not included with the Kits. Thus, inline text support is not available for TeachText, the Finder, or any other application that relies on Text Edit system routine for text input.

However, Japanese or Chinese text can still be input using the standard input window. In addition, applications that implement their own inline code or utilize the Text Services Manager will provide inline support under the Japanese or Chinese Language Kits.

Article Change History:
15 Feb 1995 - Added Chinese Language Kit info.

Language Kits: Language Kit Extension (2/95)

==========

Article Created: 13 April 1993
Article Reviewed/Updated: 14 February 1995

TOPIC --------------------

What is the Language Kit Extension?

DISCUSSION --------------------

The Language Kits come with the Language Kit extension. This extension provides system support for the integration of scripts (writing systems, or alphabets) other than the primary script. It provides a mechanism for applications to show the menu bar, title bar name, and file names in the Standard File dialog.

Specifically, for the Japanese Language Kit, this extension allows Japanese text to show up in Japanese application menu bar, the document title bar, and the Standard File Open and Save dialogs. The Language Kit Extension uses the Japanese Support extension to provide the proper user interface in Japanese. The same is true of the Chinese Language Kit.

Note:
In the standard Open and Save file dialogs, the file names shown in the scrolling field and text box will show in Japanese only if a Japanese font is selected (in Chinese if a Chinese font is selected) in the Views control panel. Otherwise, the text will be unreadable.

Language Kits: Script Preference (2/95)

==========

Article Created: 13 April 1993
Article Reviewed/Updated: 22 February 1995

TOPIC ----------

How can I view my filenames in Japanese or Chinese instead of English after installing one of the Language Kits?

DISCUSSION ----------

The Language Kits create a multiscript system. A system with one of the Language Kits installed now has a choice between English and that language for certain system functions such as sorting or entering text.

The following describes the preferences of one script (writing system or alphabet) over the other (the Japanese Language Kit is used in the example):

In the standard file Open and Save dialog box, the filenames are displayed in the font selected in the Views control panel. If a user wants to view Japanese filenames, a Japanese font needs to be selected. The Views control panel selection also affects the text which can be entered in the text box.

Within a Finder window or the standard file Open and Save dialog box, the system sorts icon names based on the primary script. For example, on an Arabic system, the Arabic sort order will be used. Thus, the sorting will be different from a Japanese system.

Icon names can be edited in either Japanese or English. However, the Views control panel must be set to a corresponding font. In order to edit or to view a file name with Kotoeri, the Japanese Language Kit input method, a Japanese font such as Osaka must be selected in the Views control panel. Otherwise, the Kotoeri input method will be grayed out in the Keyboard menu.

Language Kits: Unreadable Text (2/95)

Revised: 2/22/95
Security: Everyone

Language Kits: Unreadable Text (2/95)

==========

Article Created: 13 April 1993
Article Reviewed/Updated: 22 February 1995

TOPIC ----------

This article discusses why text may appear unreadable in the Chinese or Japanese Language Kits. The discussion below uses the Japanese Language Kit as an example.

DISCUSSION ----------

When the Japanese Language Kit is installed, there are instances when Japanese text is unreadable (for example: Ç±ÇΔÇ¶ÇË). This situation occurs when an English font is used for Japanese text. In some instances, the problem can be fixed, in others not.

Japanese Font System Basics

Please check the following basic points to make sure the Japanese font system is complete:

Kanji Bitmap Fonts In Root Level Of System Folder

The "fbit/fdef" Kanji bitmap fonts (the one with the Kanji character "kan" and the circle behind it icon) are located at the System Folder root level (not Fonts folder). At minimum, the Osaka (*Beijing* or Taipei for Chinese Language Kit) font must be installed.

InputBackSupport in Extensions

The InputBackSupport extension is installed in the Extensions folder.

Make Unreadable Fonts Readable

Following are situations where unreadable Japanese text can be made readable:

Filenames In Finder Windows:

Open the Views control panel and select a Japanese font (for example, Osaka). Note: There is a side effect in choosing a Japanese font in the Views control panel. Certain accented character and symbols (é and ™) will be replace by another character. This occurs because Japanese fonts have a different character mapping of the upper ASCII table than Roman fonts.

Japanese Application Menu Bar And Dialog Boxes:

Applications have a resource that tells the system for which language the application was written. The system uses the information to select the appropriate font. In some case, this resource was not properly set and the system has assumed English as the application's language. Use the Japanese Language Register (or Chinese Language Register) application to register the application as Japanese (or Chinese). NOTE: Some applications hard-code the font to be used, for example in text entry window or font list. In this case, the Japanese Language Register will not correct this misused font.

Unreadable Text That Cannot Be Made Readable

The following are situations where Japanese text shows up as unreadable and there is no fix:

Unreadable Text In Menus And Dialog Boxes

Unreadable text will occur in the menus and dialog boxes. For example, the Applications Menu showing an application with a Japanese name. These areas of the system were not designed to support multiple scripts (writing systems). You will see this with the Kotoeri alert messages. The alert dialog box routine uses the primary script to display the message.

System 7: Optimizing Hard Disk Space with Virtual Memory (4/93)

Revised: 4/23/93
Security: Everyone

System 7: Optimizing Hard Disk Space with Virtual Memory (4/93)

==========

Article Created: 14 April 1993

TOPIC ----------

I attempted to free up some space on my hard drive, so I dragged more than 7MB of files into the Trash. Even after I emptied the Trash, the Finder showed less than 1MB free. Can you explain?

DISCUSSION ----------

Look in the Control Panels folder under Memory. Check to see that you haven't set your Virtual Memory allocation to its maximum. If you turn Virtual Memory off (or down a bit), and restart the computer, you should have more free space on your hard drive.

At Ease 1.0 : Saving Existing Documents to Floppy (8/95)

Revised: 8/9/95
Security: Everyone

At Ease 1.0 : Saving Existing Documents to Floppy (8/95)

==========

Article Created: 14 April 1993
Article Reviewed/Updated: 08 August 1995

TOPIC ----------

I want to set up documents in At Ease so that when someone opens an existing document and modifies it, they are required to save it to floppy disk.

I have set "Require a floppy disk" in the At Ease control panel, but when someone opens the document, it can still be saved on the hard drive. What is the workaround?

DISCUSSION ----------

Existing documents opened with At Ease can be saved to the hard disk even when the "Require a floppy disk" option is enabled. The option of saving to a floppy applies only to saving new documents.

To make At Ease require a floppy disk to save an existing document, make the document a "Stationery pad". Here's how:

1) In the Finder, select the document

2) Choose "Get Info" from the File Menu

3) Click "Stationery pad".

A document marked as Stationery pad will be opened as a new document containing all the information of the original. The student can then make modifications and save document. At Ease will require a floppy disk when saving the document because it is a new copy of the original document.

A/UX 3.0 and Password Entry Error (4/93)

Revised: 4/20/93
Security: Everyone

A/UX 3.0 and Password Entry Error (4/93)

==========

Article Created: 14 April 1993

TOPIC -----

I'm running A/UX 3.0 and getting the following message when booting:

  banjo: syslog: getpwnam invalid name field:

When I hit OK, everything seemed fine. The message has gone away for now, but I've had to cut quite a bit out of my /etc/password file.

The original /etc/password file contained 172 lines of code, but the new one contains 28 lines.

I'm planning on restoring some of the userids not in the current file, but I would like to know what might be causing these error messages. I can't locate the offending entry.

DISCUSSION -----

The "... syslog: getpwnam: invalid name field:" message will be shown on the A/UX System Console window recorded by the "syslogd" deamon if there are any blank line(s) or the name filed(s) are white space(s).

Hence the blank line(s) and white space(s) field in /etc/passwd are not allowed.

We can reproduce this by inserting a blank line in the /etc/passwd file.

ARA: Installing Software Remotely (4/93)

Revised: 4/20/93
Security: Everyone

ARA: Installing Software Remotely (4/93)

==========

Article Created: 16 April 1993

TOPIC ----------

I have a PowerBook Duo with an Express Modem. When I'm using my Duo remotely, I sometimes need to update software. However, the installer functions for the software being updating require you to quit all applications -- including ARA or other connection software. Is there a workaround for this problem?

DISCUSSION ----------

There does not seem to be any workaround to the problem of an ARA connection getting stopped by the Installer. There is a limit to what a "live" install can be expected to do. We assume you are asking this question because you can't download the software (no floppy adapter and drive, or no external hard drive) then perform the installation.

We came up with two similar procedures that still require downloading the software then doing the install, but at least they do not require any additional equipment:

- Depending on the amount of software that must be downloaded and the amount of RAM installed in the Duo, you could create a RAM disk to copy the software into, disconnect and quit ARA, then run the installation. The RAM disk still appears if you then restart with the Shift key down to disable extensions. This will increase the amount of RAM available for the Installer to run in. We successfully downloaded Microsoft Mail and installed it using a RAM disk on a Duo with 4MB of RAM.

- The RAM disk method isn't likely to work with a huge program like Word or Excel. We used disk partition software that comes with Norton Utilities. We created a couple of partitions on our hard drive and copied the

software into them. The nice thing about these kind of partitions is that they can be created and deleted on the fly. Although we didn't perform extensive testing, this method also appeared to work.

Excel: Accessing Sybase Without DAL (4/93)

Revised: 4/20/93
Security: Everyone

Excel: Accessing Sybase Without DAL (4/93)

==========

Article Created: 15 April 1993

TOPIC ----------

Does the Data Access Macro, which comes with Microsoft Excel 4.0, only support databases accessible by DAL servers?

Is code available -- macros, add-ins, drivers -- which provide data access using the Sybase DB-Lib/Open Client driver? This should be an available option, since Microsoft's relational server product on Lan Manager is SQL Server from Sybase.

Is there support for data access via the Data Access Manager and thereby the Database extension for Open Client from ClearAccess?

DISCUSSION ----------

We checked with Microsoft and they only support the DAL Servers with their Data Access Macro.

They claim their macro is not DAM (Data Access Manager) compliant, and therefore would not support any of the other servers.

It is possible to use ClearAccess to actually access a far broader range of servers and platforms, and then paste the information into an Excel spreadsheet.

DAL Server For VMS and VAX Cluster Arrangement (4/93)

Revised: 4/20/93
Security: Everyone

DAL Server For VMS and VAX Cluster Arrangement (4/93)

==========

Article Created: 15 April 1993

TOPIC ----------

Questions regarding the DAL server for VMS and Rdb:

- Do Pathworks and the DAL server software need to be on the same VAX as the Rdb dataset?
- What if the VAXes are clustered: can DAL be on VAX1 and Rdb or at least the data be on VAX2?
- If a distributed topology is allowed, are there performance or support drawbacks?

DISCUSSION ----------

The DAL Server and the Rdb DBMS server must both be on the same VAX in the cluster. This is an architectural constraint and is enforced by the installation process. The DAL Server cannot be installed if the DBMS server is not present on the same VAX system.

The Rdb data can be on a different VAX in the cluster as long as the data disks are sharable across the nodes in the cluster.

Performance would depend on network traffic load among the VAXes as well as load on each of the VAXes themselves. We would expect a minimal impact when DAL and the data are separated, ALL OTHER THINGS BEING EQUAL.

MacTCP, Asanté, & Sperry Connectivity (4/93)

Revised: 4/20/93
Security: Everyone

MacTCP, Asanté, & Sperry Connectivity (4/93)

==========

Article Created: 15 April 1993

TOPIC ----------

I have several Macintosh computers with Asanté Ethernet cards connected to a Sperry computer. They are running a Sperry product called PEP, which came with MacTCP. Everything is working fine except on one Macintosh.

This is an original Macintosh II. There is no other Macintosh II in the building. The problem shows up when you try to connect to the Sperry: nothing connects.

If I try to use 'Ping' from this machine, nothing happens UNTIL you ping it from somewhere else. Then it works fine.

I have placed a Macintosh IIci in the same office on the same port and things work fine. I put a different Asanté card in the Macintosh II and that didn't work. I reinstalled most of the software, and still nothing worked.

DISCUSSION ----------

Your problem is most likely due to old Asanté Ethernet drivers. The current version of the drivers are included on their Universal Installer 5.1 disk. You can download it from the Third Parties board on AppleLink. Here is the path:

Third Parties
  Third Parties (A-G)
    Asanté Technologies
      Software Upgrades

If you have the latest Asanté drivers installed already, the next step is to use the Asanté installation diskette to remove the Asanté drivers. Once

removed, you should install Apple's Ethernet drivers. If you are running System 7, use the System 7 installation set and select EtherTalk Software from the customize option menu. If you are using System 6, then you will need to use the Network Software Installer version 1.2 or above, or the original EtherTalk Installer version 2.5.1.

Also use the Asanté TroubleShooter, a diagnostic program Asanté supplies on the Installation diskette. It checks the basic integrity of the Asanté card. Be sure the Bandwidth option collects packets.

LaserWriter Pro for Windows: Printing Problem (4/93)

Revised: 4/23/93
Security: Everyone

LaserWriter Pro for Windows: Printing Problem (4/93)

==========

Article Created: 16 April 1993

TOPIC ----------

I am using a LaserWriter Pro 600 for Windows, connected to a 33mhz 486 computer through the parallel port. I have the port switch set to 0. PostScript files print fine in the portrait mode. When I try to print them in landscape mode or print graphics, the document appears upside down and backwards. (I was using a Hewlett Packard 3P previously and it printed fine.)

I tried the drivers that came with my Pro 600 (600 and 300 dpi), and my original HP PostScript drivers, to no avail. When I reconnected my HP 3P printer, the documents printed fine in landscape mode with either driver. It also worked when I connected to a Linotronic printer. The problem only occurs when printing on the LaserWriter Pro 600.

DISCUSSION ----------

We believe this problem is related to the Windows PostScript driver (.WPD) because the .WPD files included in the "LaserWriter Pro Software for Windows" disk are only printer description files, and not drivers. The files just describe the specifications of the printer (tray capability, imageable area, etc.), so the PostScript code to render the actual image is produced by the Windows PostScript driver.

The latest version of the PostScript driver (PScript.DRV) is v3.55. Try reinstalling the driver, and then install the .WPD files again following the instructions in the LaserWriter Pro User's Guide. If the problem persists, we suggest you call Windows Technical Support directly. To locate a the phone number, search the Tech Info Library with "Windows and support".

Landscape vs. Portrait (4/93)

==========

Article Created: 16 April 1993

TOPIC --

In articles about displays, printers, and photographs I often read the terms "landscape" and "portrait." What do these terms mean?

DISCUSSION --

- Portrait is the vertical orientation, in which the display or image is higher than it is wide.

- Landscape is the horizontal orientation, where the display or image is wider than it is high.

CD-ROM: Making a Macintosh Start-Up Volume (4/93)

Revised: 4/16/93
Security: Everyone

CD-ROM: Making a Macintosh Start-Up Volume (4/93)

==========

Article Created: 5 April 1993

TOPIC ----------

What are the issues involved in making a CD-ROM volume from which a Macintosh can start up?

DISCUSSION ----------

The process of making a "bootable" CD is not trivial. The partition for the driver must be expanded -- from the HD default size of 16K to 32K -- and the CD-ROM driver must be written to that partition.

In addition, there are many portions of system software that expect to be able to write to the disk (for example, creating a preferences file) that it will obviously not be able to. Therefore, only minimal system software is included on the bootable CD-ROM. And special care must be taken to properly prepare the Desktop and Trash folders.

The boot blocks are the same as those on a hard disk, including the signature byte of "LK", indicating that the disk is bootable. An AppleCD 300i is not required to use a bootable CD. In order to make the boot process ignore the built-in hard disk, hold down the Shift, Option, Command, and Delete keys.

LaserWriter Pro and Select 310: PageMaker 4.2 and PPD (4/93)

Revised: 4/23/93
Security: Everyone

LaserWriter Pro and Select 310: PageMaker 4.2 and PPD (4/93)

==========

Article Created: 21 April 1993

TOPIC ----------

I have a LaserWriter Pro 630 and I'm using PageMaker 4.2. I realize that I need a new PPD to use the printer with PageMaker 4.2. I found the PPD on AppleLink, and placed it in my System Folder in the following location:

```
System Folder
  Aldus
     PPDs
```

PageMaker was not able to see it. I went back to AppleLink and I read that PageMaker wants to see .PPD at the end of the PPD file. I changed the name, but it still doesn't work. I get a message that says:

"Internal Error: Bad Printer Description file LASERWRITER PRO 630 V2010.PPD, line 53". Then next to the CONTINUE button it says 7304:5953.

DISCUSSION ----------

The problem is related to PageMaker 4.2 being unable to recognize PPD files of version spec 4. The PPD files for the LaserWriter Pro series and LaserWriter Select 310 are of version 4, and PageMaker 4.2 only recognizes version 3 files. The resolution is to upgrade to PageMaker 4.2a, which recognizes PPD spec 4 files.

LaserWriter Drivers: CRs & Generated PostScript Code (4/93)

Revised: 4/23/93
Security: Everyone

LaserWriter Drivers: CRs & Generated PostScript Code (4/93)

==========

Article Created: 21 April 1993

TOPIC ----------

The LaserWriter driver generates PostScript code that does not insert a carriage return (CR) every 128 characters or less automatically. This is a problem because VaxStations are unable to display or use these PostScript files. When they generate PostScript files on their Intel PCs using Windows, they do not experience this problem.

Efforts to resolve the problem:
The customer has a workaround that involves a couple of pages of instructions on reformatting the output in Microsoft Word. This is not a tenable solution since it is very cumbersome on their staff

DISCUSSION ----------

You are correct in stating that our LaserWriter drivers do not insert a carriage return (CR) every 128 characters. The carriage return is placed after a very large number, which we were unable to determine. Basically, this implementation design is because Macintoshes word-wrap lines that are too long.

We understand that this may be an issue with some computers (such as the VaxStations or the applications on them) so we will forward this information on to engineering as an enhancement request.

Theoretically, it should be fairly easy to modify the PostScript output to include a carriage return every 128 characters or less with a Macintosh text editor or a Vax editor. As long as the carriage return is placed before or after a space (the PostScript delineator), the files will be fine. By the way, we also checked the line length of PostScript comments produced by the driver and none exceeded 128 characters, so comments are not an issue.

Installer: Doesn't Replace Corrupt Files (4/93)

Revised: 4/22/93
Security: Everyone

Installer: Doesn't Replace Corrupt Files (4/93)

==========

Article Created: 16 April 1993

TOPIC -----

If I reinstall system software (using the System disks) over an existing System (with the same version as the one on the Installation disk), will the Installer overwrite/replace the existing software?

DISCUSSION -----

No, the Installer will not overwrite software with the same version number as is on the Installer. This means the Installer cannot be used to replace a corrupt file unless the corrupt file is first thrown away.

The Installer does not check for corruption or change in a file. Installer scripts vary, but in general an Installer will not replace a file if that same file exists on the Installation disk and is a like version.

This also applies to system software that has been modified by utilities such as ResEdit. The Installer will look at the modified system files, see that it is the same version as on the Installation disk and will leave the information unaltered.

How Will DAL Support ODBC and Its Relevance (4/93)

Revised: 4/21/93
Security: Everyone

How Will DAL Support ODBC and Its Relevance (4/93)

==========

Article Created: 19 April 1993

TOPIC ----------

I'm evaluating DAL (Data Access Language), I have some concerns about DAL and how it relates to ODBC. My concern centers on the expense of the DAL servers and the function of the servers as I might migrate to ODBC. In this case I'm spending a considerable amount for a single VTAM DAL server. Recognizing the "industry direction" is toward ODBC, I want to make sure my expenditure won't be a throwaway when Apple has ODBC support in DAL.

As I understand it the ODBC support Apple will have, is for the API. In the case of ODBC with DAL, the user would code to the ODBC API, but the final conversion to the native SQL will still be performed by the DAL server on the host. Is this correct? This is backward from the way ODBC would typically work, where the conversion to the native SQL is performed on the CLIENT and native SQL is then passed over the network to the host.

In DAL, you only need to change a single server instead of all the clients should you add or change a DBMS on the host server. I just want to make sure my understanding is correct.

DISCUSSION ----------

Your understanding of this issue is correct. The ODBC support will involve supporting ODBC API calls in DAL and DAM (Data Access Manager). This will enable applications that write to the ODBC API to now access all the DAL Servers. This will not make DAL a throw-away but will rather enhance it in the marketplace as it will allow more applications to participate in the environments it supports.

And yes, you were correct in the understanding that one of DAL's benefits is that a single client supports many servers. Unlike some other products, you don't have to get a client to match each server, you can expand the

server and thereby enhance "all the clients".

HP Deskwriter C: Out of Memory Error (4/93)

Revised: 4/23/93
Security: Everyone

HP Deskwriter C: Out of Memory Error (4/93)

==========

Article Created: 4/23/93

TOPIC ----------

I had a situation with a Macintosh IIsi (with 5MB of dynamic RAM, 16MB with Virtual Memory turned on) running System 7.1, attached to an HP Deskwriter C (running HP's Version 2.0 drivers). Whenever I printed from any application and then tried to launch another application, the Macintosh would come back with an "Out of Memory" message.

DISCUSSION ----------

HP Printer Support said if you are printing to an HP DeskWriter C with HP's Version 2.0 drivers (the latest), using the HP PrintMonitor, their PrintMonitor will take whatever memory is available to process the print job. This prevents you from opening other documents until the print job is completed and the PrintMonitor releases that memory. This will occur if the printer is connected via LocalTalk or serially.

Not having sufficient memory to open additional documents may not occur in every case when printing, but is quite prevalent. For example, you might be able to launch other processes while the PrintMonitor is processing a small document (say 50K) when your Macintosh has a few megabytes of available memory. However, if the print job were larger (we don't know how much larger) you may have to wait until the print job has finished.

We were unable to obtain more specific guidelines from HP Support on when problems could arise. The present workaround is to open the other documents you wanted to use prior to printing, or wait until the PrintMonitor has completed the print job.

Apple Restore: Restoring Files (4/93)

Revised: 4/22/93
Security: Everyone

Apple Restore: Restoring Files (4/93)

==========

Article Created: 16 April 1993

TOPIC ----------

Will the application Apple Restore allow me to replace files on a volume from my backup, if the files on the volume and the backup are identical in terms of version and creation dates?

DISCUSSION ----------

Yes, Apple Restore overwrites files with the same name and path information on the volume being restored. If the file on the volume has been modified since the backup was made, Apple Restore will prompt the user asking if the user wants to replace the modified file.

Files that were not archived with the backup are not affected during the restore procedure.

LaserWriter Pro: Paper Tray Questions (11/95)

Revised: 11/29/95
Security: Everyone

LaserWriter Pro: Paper Tray Questions (11/95)

==========

Article Created: 20 April 1993
Article Reviewed/Updated: 29 November 1995

TOPIC ----------

This article addresses questions on paper handling options with the LaserWriter Pro printer.

DISCUSSION ----------

Question: If a 500 sheet tray is added, can it be chosen as a separate paper source if a customer wants to have three different types of paper?

Answer: Yes, the user will have three paper sources to choose from. The 500 sheet feeder does act as a completely separate paper source.

Question: Can a 500 sheet tray be chosen as the next source if the 100 or 250 sheet trays are empty?

Answer: Yes. The user must set this up via the LaserWriter Utility 7.4.

Question: Can more than one 500 sheet feeder/tray be added to the printer?

Answer: The printer can only one 500 sheet feeder mechanism attached at any one time.

Question: If customers add an envelope feeder, will they have three different paper sources to choose from?

Answer: Yes. Once the envelope tray is attached, it will appear as an additional paper input source to choose from.

Question: If customers add an envelope feeder and a 500 sheet tray, will they have four sources to choose from?

Answer: Yes, this is the maximum at the current time. The user will have four input sources to choose from.

Question: If customers adds an envelope feeder, will they be able to use the manual feed option?

Answer: Yes, adding a envelope feeder does NOT disable the multipurpose tray.

NOTE: Remember that once a paper input source has been added, the User Test Print will indicate that the additional input paper sources are attached. However the printer driver will not show these paper input sources as additional selections until the printer driver is configured.

Steps to configure the driver:

Step 1

Choose Chooser from the Apple menu.

Step 2

Select the LaserWriter icon.

Step 3

Select a LaserWriter Pro printer for printing.

Step 4

Click Setup. This will prepare the LaserWriter driver for all input sources installed.

NOTE: The Setup button in the Chooser is located next to the background printing radio button. The button will either read Setup (if you are setting up the printer for the first time) or Review.

Step 5

The printer driver will now have these additional paper input sources as selections.

Built-In and NuBus Ethernet Maximum Transfer Rate (3/96)

Revised: 3/20/96
Security: Everyone

Built-In and NuBus Ethernet Maximum Transfer Rate (3/96)

==========

Article Created: 20 April 1993
Article Reviewed/Updated: 20 March 1996

TOPIC ----------

What is the maximum data transfer rate possible with the built-in Ethernet port in comparison to NuBus Ethernet cards?

DISCUSSION ----------

According to IEEE 802.3 Ethernet specification, Ethernet's maximum data transfer rate is 10 Mbits per second. The Apple EtherTalk card, Apple Ethernet NB card, and on-board computer Ethernet provide physical and link-level access to data communications networks meeting IEEE 802.3 and 802.2 Logical Link Control (LLC) type 1 standards.

In real life, Ethernet transfer rates from 4 to 10 Mbits per second vary depending on a number of factors, such as:

- The load of the internet network
- The network configuration
- The Ethernet buffer size on the card or board
- The type of Macintosh
- The software running
  - Version of AppleTalk
  - Operating System
  - MacTCP
  - MTU (Maximum Transmission Unit

Regarding the differences between on-board Ethernet and the Ethernet NB card, on-board Ethernet is about 15% to 20% faster than Ethernet NB card. This is because built-in Ethernet uses Direct Memory Access (DMA), it doesn't rely on NuBus data transfers, and the chip is operating at the faster system bus clock rate. Built-in Ethernet interface utilizes a 32-bit data path. The following systems use Ethernet DMA:

- Quadra systems with built-in Ethernet
- Performa 611x series
- Power Macintosh 6100, 7100, and 8100 series
- Workgroup Server 6150, 8150, 9150 series

The Quadra's on-board Ethernet is implemented using the National DP83932 SONIC Ethernet controller chip. This device includes an IEEE 802.3 encoder/decoder (ENDEC), media access control (MAC) unit, separate 32-byte send and receive FIFOs, and DMA controller in one device. SONIC is housed in a 132-pin PQFP package. A small ROM provides the Ethernet global address (which provides a unique 48-bit identity for each Quadra built). The SONIC controller includes DMA capability. It will request the bus and transfer data between its internal registers and main memory.

The Curio integrated circuit (IC) controls the Ethernet functions on Power Macintosh computers. The Curio IC is a multipurpose custom IC that contains a Media Access Controller for Ethernet (MACE), a SCSI controller, and a Serial Communications Controller (SCC). The Curio IC supports DMA transfers between its I/O ports and the computer’s main memory.

DAL and DB2 HyperCard Demo Disks (4/93)

Revised: 4/22/93
Security: Everyone

DAL and DB2 HyperCard Demo Disks (4/93)

==========

Article Created: 20 April 1993

TOPIC ----------

If I have the DAL demo database on a user dataset, for example APPLE1, I can't use it from APPLE2 with the Raskin-Bobbins HyperCard stack, because the requests mention APPLE2.OFFICES. Do I have to change something in the HyperCard stack, DAL parameters, or make logical links in DB2 to resolve my problem?

DISCUSSION ----------

DB2 requires that all tables are referenced by both the creator name (or owner name) and the tablename. This means that, if you don't supply the creator name in the SQL statement, DB2 will append your userid to the tablename and search for that "creator.tablename". So when APPLE2 tries to use the Raskin-Bobbins stack, which does not explicitly supply the creator name, DB2 will search for:

APPLE2.ORDERS, and so on

Since your tables are created with "APPLE1" as the creator, no valid tablenames will be found and the queries won't work.

In order to be able to use the Raskin-Bobbins stack against DB2 in this instance, without having to go into all the scripts and change every SQL statement, you have to be able to enter the creator name as needed, in this case as "APPLE1" whenever you sign on as some other userid.

This can only be done on the connection card that is offered after the 'Setup' button is clicked. This card will display the "Host Connection" card which requests the Connection Name, Userid and Password.

You use the pop-up menu to select your hosts.cl1, or DAL Preferences,

Connection Name. If the hostname of the selected connection script begins with 'tso', 'vm', or 'cics' another field will appear called "Owner ID".

This field is required for you to be able to enter the desired creator or owner name. This will become the creator name that is automatically used in every SQL statement in the current execution of the stack.

There is only one feasible way to be able to get this button to appear on the Setup card:

> Change the hostname (first field) in the connection script to begin with 'tso' -- the script keys, off those characters and will display the field to allow you to enter the desired creator name.

When you do that:

- The "Owner ID" field will appear
- You will be able to insert the creator name you wish to use
- BE SURE TO follow it with a period ('.') so it displays as: "APPLE1."
- Then insert your userid and password and continue as usual

This will cause all the SQL statements to access the tables as (APPLE1.tablename) instead of as (uerid.tablename) which is what you desire.

LaserWriter Pro: Envelopes Must Load Flush Left (4/93)

Revised: 4/16/93
Security: Everyone

LaserWriter Pro: Envelopes Must Load Flush Left (4/93)

==========

Article Created: 9 April 1993

TOPIC ----------

I normally use a LaserWriter Plus to print envelopes. When I printed some envelopes on my LaserWriter Pro, they came out blank.

DISCUSSION ----------

This happened because your document is configured to print the address in the wrong place on the envelope.

With the LaserWriter, LaserWriter Plus, and Personal LaserWriter printers, you feed the envelopes into the right side of the Manual Feed Tray or Multipurpose Tray. In landscape mode, the address will print on the top of the imaged page, so you must put the address block across the top of the document.

With the LaserWriter II and LaserWriter Select printers, you feed envelopes into the center of the Manual Feed Tray, Multipurpose Tray (for the LaserWriter Select), or Envelope Feeder/Cassette. In landscape mode, the address will print in the center of the image, so you must move the address block down to the middle of your document.

With the LaserWriter Pro, you must feed envelopes onto the left side of the Multipurpose Tray or Envelope Feeder. In landscape mode, the address will print toward the bottom of the image, so you must move the address block down to the bottom of your document.

For instance, if you've created a document to print envelopes on a LaserWriter Plus and use it to print envelopes to a LaserWriter Pro, the address block will miss the envelope and print on the inside of the printer instead.

To cure this, you must put the address block on the appropriate part of the document for the printer you are using, then adjust the top and bottom margins

until the address prints in the proper place.

DAL For MVS/VTAM and Authority List of DB2 (4/93)

Revised: 4/22/93
Security: Everyone

DAL For MVS/VTAM and Authority List of DB2 (4/93)

==========

Article Created: 20 April 1993

TOPIC ----------

Is it true that DAL uses the authority list of DB2 running on MVS/VTAM, and not its own list?

DISCUSSION ----------

Yes, DAL uses only the DBMS's authorization. DAL uses the operating systems's security package (RACF, ACF2, Top Secret, and so on) to verify a userid and password. When these are valid, DAL then passes the userid on to the DBMS and it determines all data access based on that userid. DAL has no "authorization" information, or qualification, of its own.

Photo CD: How to Display an Image (4/93)

==========

Article Created: 15 April 1993

TOPIC ----------

This article describes how to display a Photo CD image on a Macintosh computer.

DISCUSSION ----------

1) Insert the Photo CD into your CD-ROM drive. A Photo CD Icon should appear on your desktop.

2) Double-click on the Photo CD icon. You will see photo folders, a Kodak folder, a "Slideshow" file, the Slideshow Viewer application, and a Photo CD folder.

3) To see a slideshow of your images, open the Slideshow View application. You will be able to display each picture, and scroll through the pictures.

4) To see an image at high resolution, open the photo folder and double-click on the image you wish to display. You'll be asked if you want to view the picture in TeachText. TeachText will display the image (if enough memory is available) and you can copy and paste or print the image. Each image is included in five pixel resolutions: 128 by 192, 256 by 384, 512 by 768, 1024 by 1536, and 2048 by 3072.

Photo CD images can be opened from the CD by any application that can open a PICT file.

You must have the following resources to display Photo CD images:

- A Macintosh computer with a 68020 processor (or better), and at least 2MB of memory (4MB is recommended).

- An AppleCD SC, AppleCD SC Plus, or AppleCD 150 (for single session Photo CDs only); or AppleCD 300 or 300i (single or multisession Photo CDs) CD-ROM drive -- or an Apple-compatible CD-ROM drive which can read the CD-XA format, with compatible driver software.
- System Software 6.0.7 or later.
- CD-ROM Setup 4.0.2 or later (Apple CD-ROM drives only).
- QuickTime 1.5 or later.
- Apple Photo Access.

The CD-ROM Setup driver must be installed in your System Folder.

Here's where the QuickTime 1.5 and Apple Photo Access system extensions must be installed:
- System 7: in the Extensions Folder in your System Folder
- System 6.0.7/6.0.8: in the root level of your System Folder

PhotoGrade: Description (4/93)

Revised: 4/26/93
Security: Everyone

PhotoGrade: Description (4/93)

==========

Article Created: 16 April 1993

TOPIC ----------

This article describes PhotoGrade printing technology, Apple's proprietary technology that uses grayscaling and halftoning to provide high-quality graphic images on Apple laser printers.

DISCUSSION ----------

How Grayscale Images are Produced

While many graphic images are grayscale, laser printers can only print black dots or no dots (which produces white areas). To print gray images, laser printers must convert grayscale images into black and white images for printing. This process is called halftoning.

Screening, the most popular halftoning technique, uses a matrix of black and while pixels to simulate shades of gray. Each matrix of pixels is also known as a halftone cell or screen. As you add more pixels to the halftone cell, you have more shades of gray available.

The size of the halftone cells determines the screen frequency. Screen frequency is defined as the maximum effective image resolution of the printer for a given size halftone cell. As the screen frequency increases, the number of gray shades decreases.

How PhotoGrade Works

PhotoGrade optimizes graphic images to provide the maximum possible screen frequency with the largest possible number of gray shades.

PhotoGrade increases the number of gray shades available. It uses a custom ASIC to allow the laser to fire at shorter than normal intervals, which

produce smaller dots than normal. This, in itself, produces more gray shades. Once smaller dots are produced, PhotoGrade can intelligently select which gray shades are most distinct and thereby provide more apparent gray shades.

PhotoGrade also combines halftoning with its grayscaling ability. Because PhotoGrade has so many more gray levels for each pixel, a much smaller halftone cell can be used while providing more gray shades. This results in a higher effective resolution and produces sharper images.

PhotoGrade can produce up to 91 levels of gray on the LaserWriter Select 300 and LaserWriter Pro 600 and 630 with a 106 line halftone screen. Without PhotoGrade, 600 dpi laser printers produce 33 levels of gray and 300 dpi laser printers produce 9 levels of gray with a 106 line halftone screen.

DAL: MVS/VTAM Installation Effort (4/93)

Revised: 4/26/93
Security: Everyone

DAL: MVS/VTAM Installation Effort (4/93)

==========

Article Created: 22 April 1993

TOPIC ----------

I have some questions regarding the installation effort with DAL for MVS/VTAM. I'm interested in evaluating DAL and would like to know how much time and effort is involved. I plan on using SMPE to install DAL: would this cause a problem? Also please provide a rundown of the installation steps and other related configuration changes (NCP gen, and so on) that would be required.

DISCUSSION ----------

SMPE is the facility that IBM uses for the installation of their system software. It simplifies backing out of an installation if something goes wrong. Data Access Language's installation is very straight-forward and consequently is not set up to install under SMPE. Instead, the tape comes with the first file being JCL, which downloads the remainder of the files on the tape to a number of libraries (JCL, LINKLIB, and so forth) as appropriate.

The Installation Guide for the VTAM Server should give you a good idea of the magnitude of the task.

A length-of-time estimate would be difficult because each site's configuration can have an effect on the amount of time it takes to install. A range is from less than a day, to a maximum of three days.

If the product is installed in a site where:

- RACF is the security package
- Only 3270 (no APPC) connections will be made
- There is no problem installing with a high-level dataset name of 'DAL'
- The DBA is free to do the Bind and Grant in a timely manner

- The Systems Programmer takes the 1 1/2 to 2 hours to read the entire install guide before beginning
- The Systems Programmer verifies the install as defined on page 16 of the install guide
- There is someone on the client side familiar with Macintosh and what is required to connect with a 3270 session to the site's MVS system

Then it should take less than a day to install the server and make a connection from the Macintosh. No additional NCP definitions are required if you use 3270 (LU2) sessions off existing controllers, or gateways.

The security product ACF2 requires additional installation work, a SAF rule.

If SNA•ps is used for the connectivity, the connection process is likely to take longer to configure than Avatar or Netway, and so on. However, it is much more powerful, offering the opportunity to do APPC connections as well as 3270 sessions. It is the APPC configuration which can cause additional installation time, as changes may be required to the VTAM tables to define an XID and Log Mode to support LU6.2 connections.

Connectix: Enabler Patch (4/93)

Revised: 4/26/93
Security: Everyone

Connectix: Enabler Patch (4/93)

==========

Article Created: 23 April 1993

TOPIC ----------

The purpose of this article is to clear up the confusion regarding the "Enabler patch" (released by Connectix), which patches a specific ROM routine (GetIndResource) to change its behaviour when an invalid parameter is passed to that routine.

DISCUSSION ----------

When a negative index is passed to GetIndResource, low memory globals can become corrupted, which will lead to a system error. There is no situation where a negative index should be passed to this routine. Instead of changing the code that passes a negative index to GetIndResource, Connectix chose to modify the behavior of the GetIndResource routine with their patch.

Apple does not support or recommend the enabler patch distributed by Connectix. The patch has not been completely tested, and it causes new compatibility problems with other third-party software. Customers with further questions on the enabler patch should contact Connectix.

There has been additional confusion between Apple's Hardware Systems Update and Connectix's patch, partly because they were released at about the same time. The Hardware Systems Update released in February does not patch GetIndResource. There was a problem with Apple File Exchange on a few machines where Apple File Exchange had the same problem of passing an invalid index to GetIndResource. The Hardware Systems Update fixes Apple File Exchange on these systems. It does not modify GetIndResource.

PowerBook Duo, Express Modem, & StyleWriter II (3/95)

Revised: 3/14/95
Security: Everyone

PowerBook Duo, Express Modem, & StyleWriter II (3/95)

==========

Article Created: 22 April 1994
Article Reviewed/Updated: 14 March 1995

TOPIC ----------

I have encountered an anomaly using a PowerBook Duo 230 with StyleWriter II printers. In this case, it is a Duo with an Express Modem installed.

Assume I'm printing from an undocked Duo and that AppleTalk is inactive as defined in the Chooser.

In the Chooser, select the StyleWriter II icon, turn on Background Printing, and click on Printer (Serial Port). Close the Chooser. Print a document. PrintMonitor comes up with an alert that "The serial port is currently in use by another application. Please quit that application and print again." But it just isn't so!

Apple Remote Access (ARA) is not set to answer calls (this should be irrelevant, since we are set to use the Express Modem). Personal File Sharing & Program Linking are off (this should also be irrelevant, since AppleTalk is turned off).

Similar weirdness seems to happen with a MiniDock, although I have not been able to evaluate all the combinations.

Are there any tricks in printing to the StyleWriter II with a Duo 250 and/or a 270c?

DISCUSSION ----------

Regarding the undocked configuration you describe (Duo 230 w/ Express Modem, ARA 1.0, StyleWriter II connected to the serial port, AppleTalk turned off) -- Yes, it is possible to print to the StyleWriter II.

If you have AppleTalk turned on, you need to select "Remote Only" in

the Network Control Panel.

If you have AppleTalk turned off, no changes are needed.

Select External Modem in the PowerBook control panel. The Express Modem provides a means of compatibility for those applications which do not support the Comm Toolbox. Selecting Internal Modem in the PowerBook control panel will enable applications using serial port A (External Modem Port) to communicate with the Express Modem. ARA does not have that problem, therefore the PowerBook control panel should be set to External Modem.

When you select StyleWriter II via the Chooser, two icons will be displayed: printer and modem. It doesn't matter which one you select, because they are both directed to one port anyway. Because of this, the modem icon will always be highlighted when you open the Chooser and select StyleWriter II.

Because you have Apple Remote Access installed, it is recommended that you remove the Serial Port Arbitrator extension from the Extensions folder inside the System Folder. Apple Remote Access will still function properly. The extension just keeps track of the names of applications using serial ports for user notification.

The software (with the Duo 250 and 270c) used to print to the StyleWriter II with a 250 and 270c is differenct from the software that is used with the Duo 210/230.

The following procedure works well when using an undocked Duo and a StyleWriter II:

a) Go to Express Modem Control Panel and turn it OFF.
b) Go to PowerBook Setup Control Panel and set modem to Normal (External).
c) Go to Chooser and verify that Appletalk is OFF. If ON, turn OFF.
d) Select the StyleWriter II driver and select the MODEM port.

HyperCard 2.1 Player: Error t63 (4/93)

==========

Article Created: 23 April 1993

TOPIC --------------------

What is HyperCard's error "t63"?

DISCUSSION --------------------

Error t63 is generated by the HyperCard 2.1 Player. The error mechanism in the Player is different from HyperCard's. HyperCard Player produces a letter indicating the error type and then a number indicating an exact message.

In this case, the "t" refers to the string resource "Talk Errors" and "63" means: Can't understand "^0".

For more information on HyperCard Player Error Messages refer to the Technical Information Library on AppleLink. Follow this folder structure:

Incorrect SQLCode With DAL and Selective UPDATES (4/93)

Revised: 6/4/93
Security: Everyone

Incorrect SQLCode With DAL and Selective UPDATES (4/93)

==========

Article Created: 23 April 1993

Article Change History

06/04/93 - REVISED
- To better state the problem.

TOPIC ----------

There is a problem with DAL that an update with a "where" clause does not return the proper sqlcode if no rows met the "where" criteria.

DISCUSSION ----------

There is a workaround to do a select with the desired "where" clause before attempting the update, checking the sqlcode to see if there were any rows, and then continuing with the update only when the sqlcode is 0:

```
Select * from offices where city = 'none';
fetch;
print $sqlcode;
```

If there was at least one row in the cursor, the $sqlcode will be zero (0), otherwise it will be one hundred (100).

It is necessary to do a fetch before the "print $sqlcode", because the SQL generated by the select is only the prepare, describe and open of the cursor. The fetch command actually causes the DBMS to execute the statement and return rows to the cursor table.

Alternatively, if you want a 'count' of the rows that would be changed, as opposed to just knowing whether there were 'any' rows that met the where clause, the workaround statements should look like this:

```
   select * from offices where city > 'abc' for scrolling;
   fetch last;
   print $rowcnt;
```

Here, a "select...for scrolling" (or "select...for extract") is required to be able to get a count of the entire cursor table with a single fetch statement. The "fetch last" is required to force the server to actually fetch all the rows that qualify. This then enables the "print $rowcnt" command to return the actual number of qualifying rows with one fetch command.

LaserWriter: Available PCL-Compatible Fonts (12/96)

Revised: 12/20/96
Security: Everyone

LaserWriter: Available PCL-Compatible Fonts (12/96)

==========

Article Created: 26 April 1993
Article Reviewed/Updated: 19 December 1996

TOPIC ----------

Which Hewlett-Packard PCL-compatible fonts, styles, and sizes are included in Apple's PCL-compatible LaserWriter printers?

DISCUSSION ----------

Here is a table that shows the PCL fonts available for PCL-compatible LaserWriter printers.

Begin_Table

Apple LaserWriter Model	PCL ROM-Resident font	PCL ver.	Notes
LaserWriter IIf, LaserWriter IIg, LaserWriter Pro 600, LaserWriter Pro 630, Personal LaserWriter NTR	Courier No Line Printer font available. No other ROM-Resident fonts available in PCL mode.	4+	1
LaserWriter Pro 810	33 of the 35 Type 1 fonts are used and rasterized as PCL fonts. Only ZapfDigbats Symbol fonts cannot be used as PCL fonts.	4+	
LW Select 360, LW 16/600 PS, LW 12/640 PS	Times Roman, Univers Medium, Courier, Line Printer	5	

End_Table

NOTES:

(1) There is actually a problem with the HP emulator that inadvertently allows access to the Helvetica and Times-Roman fonts. You can access these two fonts through the same PCL escape code command to change typefaces.

PCL Escape Codes
================

In terms of styles and sizes, Apple supports the PCL escape codes listed below for font manipulation:

```
<esc>(s#T    : typeface selection (#= 3-Courier,4-Helvetica,
               5-Times-Roman)
<esc>(s#H    : pitch selection (#= usually 10 or 16.66 built-in)
<esc>(s#V    : character height (#= Font Size in points)
<esc>(s#B    : stroke weight (#= -7 to 7 for BOLD style)
<esc>(s0P    : proportional spacing OFF
<esc>(s1P    : proportional spacing ON
<esc>(s0S    : italic OFF
<esc>(s1S    : italic ON
<esc>&d@     : underlining OFF
<esc>&dD     : underlining ON
```

Apple also supports a variety of symbol sets (i.e. USASCII, PC-8 US, etc.) which are different types of characters available as part of the different fonts. These characters include mathematical symbols, foreign language accented characters, etc.

```
<esc>(#      : change Symbol Set (#= symbol set as listed below)
```

Symbol Set	#
ISO-60 Norwegian	0D
ISO-25 French	0F
German	0G
ISO-15 Italian	0I
ISO-14 JISASCII	0K
ECMA-94 Latin 1	0N
ISO-11 Swedish	0S
ISO-6 ASCII	0U
ISO-61 Norwegian	1D
ISO-4 UK	1E
ISO-69 French	1F
ISO-21 German	1G
Spanish	1S
ISO-57 Chinese	2K

ISO-17 Spanish	2S
ISO-2 IRV	2U
ISO-10 Swedish	3S
ISO-16 Portuguese	4S
ISO-84 Portuguese	5S
ISO-85 Spanish	6S
Roman-8	8U
PC-8 US	10U

In the PCL commands and Symbol Set list above, 0 represents the numeral zero, not the upper-case letter O. Also, <esc> represents the ESCAPE or esc character.

LW Select 310: Serial Connection to MS-DOS Computer (4/93)

Revised: 4/28/93
Security: Everyone

LW Select 310: Serial Connection to MS-DOS Computer (4/93)

==========

Article Created: 26 April 1993

TOPIC ----------

Can you connect a MS-DOS/Windows computer to the RS-232 serial port of a LaserWriter Select 310?

Also, can you use both serial and parallel ports at the same time?

DISCUSSION ----------

To answer the second question first: you CANNOT use the parallel and the serial ports simultaneously. The LaserWriter Select 310 will get confused as it polls both ports for data.

You may be able to connect an MS-DOS or Windows computer to the RS-232 serial port of the LaserWriter Select 310 and print documents, but Apple does NOT support this solution. Apple only supports connection to a MS-DOS or Windows computer through the Centronics parallel connector.

If you want to try to connect the Select 310 serial port to your MS-DOS or Windows computer, we have included the pinouts below for the DB-25 to DIN-8 cable (DTR/DSR protocol is enabled). You will also need a communications program to send data to the printer at 57.6K baud.

Remember that the LaserWriter Select 310 is a PostScript-only printer and does not emulate any other printers.

Cable Pinouts

(DTE)

25 PIN	8 PIN	Signal	Description	I/O
---	---	---	---	---

2	3	/TXD	Transmit Serial Data	Output
3	5	/RXD	Received Serial Data	Input
6	2	DSR	Data Set Ready	Output
7	4,6	GND	Signal Ground	
20	1	DTR	Data Terminal Ready	Input

The remaining pins are not connected.

FileShare & AppleShare: Setting Labels On Shared Files (4/93)

Revised: 4/27/93
Security: Everyone

FileShare & AppleShare: Setting Labels On Shared Files (4/93)

==========

Article Created: 25 April 1993

TOPIC ----------

I have had problems setting labels on shared files in the following situations:

- I logged on to a Personal File Sharing machine, selected a folder, changed the label (color), and closed the window. When I re-opened the window, the color had reverted to the original color.

- I tried doing the same thing with an AppleShare file server with the same result.

- I then tried this on a AppleShare file server with a folder I owned, thinking perhaps I was prohibited from changing the color of a folder I didn't own. I closed the window and re-opened it, the folder had reverted back to the original color.

DISCUSSION ----------

The owner of a folder or volume controls the labels in the first level of that folder or volume. The bottom line: unless you own the folder that contains the folders you are trying to change the labels on, the changes won't remain. As long as a window is open, whatever labels are assigned will remain. When the window is closed, the labels revert to their previous state.

As an example, create a folder named A1, owned by A, that allows all privileges to users A, B, and C. Within the A1 folder users A, B, and C create folders A2, B2, and C2, respectively. Only user A can change the labels on folders A2, B2, and C2. All three users, A, B, and C have read write access to all three folders A2, B2, and C2. Let all three users create folders within A2, B2, and C2. Only user A will be able to change

labels in folder A2, B in folder B2, and C in folder C2.

The confusion results from your expecting that, as owners of a folder you should be able to control the label of that folder. This is not the case.

This appears to hold true for both File Sharing and AppleShare. We don't believe this is a problem because AppleShare 3.x requires System 7 but does not require System 7 on the client side. Since System 6.0.x does not support labels there isn't a compelling reason to have AppleShare update that information dynamically the way file or folder names are. Since View by Name, Data, and so on is supported by both System 6 and 7 it makes sense to maintain the view that the user selects at least to one level of depth. If you change the view in a window that is two levels down and you close all the windows the view will revert to the original. The overhead of keeping track of the views dynamically while multiple people are using the same folders would be too great. Obviously these attributes are kept locally and in a limited fashion.

This does not cause any data loss, but users may be disappointed if things do not work intuitively. Workarounds can be devised, such as setting the label on a folder locally, then copying the folder to the server, but we doubt the "cure" will be worth the effort in most cases.

Macintosh II: 32-bit System Enabler (2/95)

Revised: 2/24/95
Security: Everyone

Macintosh II: 32-bit System Enabler (2/95)

==========

Article Created: 27 April 1993
Article Reviewed/Updated: 24 February 1995

TOPIC ----------

This article describes what is needed to use the 32-bit System Enabler with the Macintosh II.

DISCUSSION ----------

To use the 32-bit System Enabler, a Macintosh II must have:

- a PMMU
- FDHD (SuperDrive) ROMs
- rev B logic board (required for FDHD ROMs)

See your authorized Apple reseller for these items.

MacTCP: No Public Domain Version, but Workaround (4/93)

Revised: 4/28/93
Security: Everyone

MacTCP: No Public Domain Version, but Workaround (4/93)

==========

Article Created: 27 April 1993

TOPIC --

I'm looking for a "Public Domain" version of MacTCP. This may be a version 1.0 that was available, before we had site licensing issues.

Some questions:

• Is there a Public Domain version of MacTCP?

• Is it available now?

• Will it still work? (Or was it tied to a specific version of the OS?)

DISCUSSION --

There isn't really a "public domain" version of MacTCP available.

Although you might be able to find a copy of the MacTCP 1.0 product and there might not seem to be a "legal" reason to not give it out, there is, however, a technical reason not to. That release of the software (and 1.0.1 also) will not work with newer releases of system software, notably 7.1.

Instead, we suggest that you get release 2.5 of NCSA Telnet. With this release you can support either MacTCP or direct Ethernet / AppleTalk connections. You would not need to use MacTCP at all. Also, at release 2.3 of NCSA Telnet there was one version that supported MacTCP and another that supported Ethernet / AppleTalk directly -- so even at that release level you are not forced to use MacTCP.

Please refer to the following excerpt from the ReadMe that accompanied the 2.5 release of NCSA Telnet:

========== ReadMe ==========

IMPORTANT NOTES- June 1992 NCSA/BYU Telnet 2.5

There are some substantial changes with this release of Telnet. While all of these changes are described fully in the documentation, they are worthy of another mention here. If you do not already have the Telnet 2.5 documentation, please get it from anonymous ftp from: ftp.ncsa.uiuc.edu

NCSA/MacTCP drivers

NCSA Telnet previously came in two versions: NCSA driver version, and MacTCP driver version. However, in this release of Telnet, the two versions have been merged into one application. This allows greater flexibility, along with removing the need to have two different applications for basically the same program. You may select the NCSA drivers, by appropriately setting the hardware= line in config.tel to ether, or atalk.

To select the MacTCP drivers, you may set hardware=mactcp in the config.tel file. Also, since Telnet defaults to MacTCP, if there is no hardware= line, Telnet will still assume that MacTCP is to be used.

========== End ReadMe Selection ==========

LaserWriter Pro 630: Changing Default Paper Tray (4/97)

Revised: 4/14/97
Security: Everyone

LaserWriter Pro 630: Changing Default Paper Tray (4/97)

==========

Article Created: 4 May 1993
Article Reviewed/Updated: 14 April 1997

TOPIC ----------

If I install a 500-sheet feeder on a LaserWriter Pro 630, in a standard MS-DOS environment how do I make the 500-sheet tray the default tray?

DISCUSSION ----------

The PostScript code below changes the default paper tray to the 500-sheet tray. (Remember, PostScript code IS case-sensitive.)

PostScript Level 1 code:

```
%============================================================
% Begin PostScript Code
%
serverdict begin 0 exitserver
statusdict begin 2 setdefaultpapertray end
%
% end PostScript Code
%============================================================
```

CAUTION:
Use this PostScript code at your own risk. You are responsible for the support of any problems associated with changing the default tray. You should also inform others using the printer that you have changed the default tray. Changing the default tray on the printer may cause the paper out LED to light if there is no paper present in the default tray, or if the wrong size paper is used in the tray. When this happens, there is nothing wrong with the printer's hardware.

To change the default tray to another tray, change the number before the "setdefaultpapertray" operator to one of the following values.

Value	Tray Selection

0	250 Sheet Cassette
1	Multi-purpose tray
2	500 Sheet Cassette
3	Envelope tray

This is the equivalent PostScript Level 2 code:

```
%=========================================================
% Begin PostScript Code
%
serverdict begin 0 exitserver
1 dict dup /InputAttributes 1 dict dup /Priority [2 1 0] put put setpagedevice
%
% End PostScript Code
%=========================================================
```

This sets the paper tray priority to:
1st Priority - Cassette (500 Sheets) - designated by the "2" in the array above.
2nd Priority - Multipurpose Tray - designated by the "1" in the array above.
3rd Priority - Cassette (250 Sheets) - designated by the "0" in the array above.

You can change the paper tray priority order by changing the values in "/Priority [2 1 0]".
For example, /Priority [0 1 2] makes the 250 sheet cassette first priority, then the Multipurpose tray next, then the 500 sheet cassette.

After downloading the code, you can verify that the change was made by printing the configuration page.

Article Change History:
14 Apr 1997 - Added PS Level 2 code.
21 Apr 1995 - Added Caution message.

LaserWriter: Sharing a Hard Drive with a Macintosh (5/93)

Revised: 5/4/93
Security: Everyone

LaserWriter: Sharing a Hard Drive with a Macintosh (5/93)

==========

Article Created: 3 May 1993

TOPIC ----------

I've used the LaserWriter utility software to format an Apple hard drive to store fonts for a LaserWriter. If I decide to use the same drive with a Macintosh, will the computer recognize the drive, or must I reinitialize the drive first? In other words, does the LaserWriter utility format the hard drive in a different way than the Macintosh does?

If the formatting is different, will formatting the drive for the Macintosh (instead of using the LaserWriter Utility) allow the hard drive to be attached to a LaserWriter (such that the LaserWriter recognizes it for storing fonts)?

Which LaserWriter, and which version of LaserWriter Utility, will allow a hard drive to be recognized by both a Macintosh computer and a LaserWriter? Can the same results be expected if a third-party hard drive is used (providing the hard drive functions on the Macintosh and/or the LaserWriter?

DISCUSSION ----------

The answer depends on which LaserWriter you're using.

LaserWriter NTX

The LaserWriter NTX uses the LaserWriter Font Utility to initialize drives and download fonts. This utility formats the disk(s) as one logical disk device for the PostScript file system. Because the LaserWriter NTX regards all attached hard disks as a single logical unit, these drives are not recognized by the Macintosh file system.

LaserWriter IIf and IIg, LaserWriter Pro Series

Beginning with the LaserWriter IIf and IIg, LaserWriter Utility (version 7.1 and later) took over the task of downloading the fonts and initializing the drives. With this utility, the drive is Macintosh (HFS) compatible and supports the PostScript file system. The file system supported by the LaserWriter IIf and IIg, and the LaserWriter Pro series, is described in sections 3.8.2 and 3.8.3 of the PostScript Language Reference Manual (second edition), with the following restrictions:

- Filenames cannot begin or end with a slash, or contain adjacent slashes (//).

- Filenames may not contain the colon character (:).

- There may not be more than 31 non-slash characters between two slash characters, and the total number of characters in the filename may not exceed 255.

- Because the printer uses SCSI ID 6, it is not possible to use a disk drive whose SCSI ID is also 6.

While formatting the drive, the LaserWriter Utility does some additional functions. It names the drive "disk#" (where # is the drive's SCSI ID) and it creates a folder, at the root level, named "fonts". Although it is possible to manually do these functions from the Macintosh, it is much simpler and cleaner to let the Utility do the work.

Downloading fonts should be done only through the LaserWriter Utility. So that the fonts are recognized on the PostScript file system, the utility:

- Removes the fonts from their suitcases and places them in the "fonts" folder.

- Changes the file type and creator.

- Renames the fonts (for example, "Courier (bold)" is renamed "Courier-Bold").

Non-Apple Drives

If you are considering connecting non-Apple hard disks to your LaserWriter, keep these points in mind:

- The LaserWriter must be able to tell how much space is available on the disk. This is not possible with some hard disks from manufacturers other than Apple.

- Some non-Apple disks have internal SCSI terminators. Since the LaserWriter has an internal terminator, put any disk with an internal terminator at the other end of the chain, and do not use an external terminator. There should be no more than two terminators in any SCSI chain.

MacX 1.2 Features, from Release Notes (4/93)

Revised: 4/29/93
Security: Everyone

MacX 1.2 Features, from Release Notes (4/93)

==========

Article Created: 28 April 1993

TOPIC ----------

This article describes the new features and other improvements of MacX 1.2, configured to broaden compatibility with X client applications and to provide you with increased ease of use. You may even notice some improvements in performance. In most cases, you'll never have to adjust the MacX 1.2 default settings. Advanced users, however, may want to study the following feature descriptions to see if their special needs might be met by changing the default settings.

DISCUSSION ----------

This section provides information about improvements and features not described in the MacX 1.1.7 Release Notes or the MacX User's Guide:

- If your Macintosh computer has a color monitor and video card, MacX 1.2 makes color graphics capabilities available to X client applications by default. No special "screen" designations are required. Advanced users, however, can change the screen designation to meet special needs.

- MacX 1.2 provides further display improvements with a special option preset to disable non-zero screens. With this option as the default, the server only recognizes screen 0. This is helpful for those clients that experience programmatic conflicts caused by the presence of multiple screens. Advanced users, however, can change this option to enable multiple screens.

- MacX 1.2 provides standard X Window System Backing Store and Save Under capabilities. With these features, graphics don't have to be redrawn every time an overlapping window or pop-up menu is moved or closed. Some X client applications rely on these capabilities to support complex graphical operations.

- MacX 1.2 makes all 256 entries of each screen's default colormap available for use by X client applications. This treatment of screen colormaps represents a change in the default function of MacX 1.1.7.

- By default, MacX 1.2 disables the Smoother Animation feature in order to provide better graphics performance. This represents a change in the default setting from the MacX 1.1.7 setting.

- MacX 1.2 allows client applications to connect to your Macintosh computer without any action on your part. If you want to control which X client applications are displayed on your MacX server, you can enable Access Control from the MacX Remote menu. As a result, a host access alert box will be presented to you before an X client is allowed to be displayed on your screen. This treatment of host access alert boxes represents a change in the default setting from MacX 1.1.7.

- New window-menu commands give you more ways to manage windows. The Circulate Up and Circulate Down commands give you easy ways to switch between windows. The Maximum Height / Restore Height command gives you an easy way to resize windows.

- MacX 1.2 reports the size of a window as you resize it.

More Flexible Screen Configurations

MacX 1.2 provides greater compatibility for X client applications that are unable to support more than one X server screen. This improvement is especially useful for clients that only check the default screen for color support. MacX now supports clients that expect color capability on the default screen, also called screen zero, or the screen corresponding to the display host:0.0.

The default settings for screen zero are as follows:

- Match Best Monitor. If you have a color monitor connected to your Macintosh computer, the default screen is configured for color. If you don't have a color monitor, MacX displays the screen in black and white. If you have more than one monitor attached to your Macintosh, the MacX Window Manager places clients on the color monitor by default.

- Rootless Mode. The default screen is a rootless screen that uses the MacX Window Manager to adorn client windows in the Macintosh style.

Advanced users can change the screen designation to meet special needs. To change the default screen configuration, follow these steps:

1) Open the MacX application program by double-clicking its icon.

2) Choose the Display Preferences command from the Edit menu.

3) Click the Screen Zero options that correspond to the configuration you want.

Once you choose Screen Zero options, the attributes of the other MacX screens are established according to the following table.

- Note - If you have the Disable Non-zero Screens option (the default setting) turned on, then only the screen 0 column has meaning.

MacX Screens - ("Monochrome/" is represented in the table as "Monochrm/")

Screen Zero options	Video card	Screen 0	Screen 1	Screen 2	Screen 3
Match Best Monitor (Rootless)	8-bit/pixel (256 colors)	Color/ Rootless	Color/ Rooted	Monochrm/ Rootless	Monochrm/ Rooted
	1-bit/pixel (monochrome)	Monochrm/ Rootless	Monochrm/ Rooted	Color/ Rootless	Color/ Rooted
Match Best Monitor (Rooted)	8-bit/pixel (256 colors)	Color/ Rooted	Color/ Rootless	Monochrm/ Rooted	Monochrm/ Rootless
	1-bit/pixel (monochrome)	Monochrm/ Rooted	Monochrm/ Rootless	Color/ Rooted	Color/ Rootless
Color (Rootless)	Any	Color/ Rootless	Color/ Rooted	Monochrm/ Rootless	Monochrm/ Rooted
Color (Rooted)	Any	Color/ Rooted	Color/ Rootless	Monochrm/ Rooted	Monochrm/ Rootless
Monochrome (Rootless)	Any	Monochrm/ Rootless	Monochrm/ Rooted	Color/ Rootless	Color/ Rooted
Monochrome (Rooted)	Any	Monochrm/ Rooted	Monochrm/ Rootless	Color/ Rooted	Color/ Rootless

- Click the Black and White button, and screen zero (the default screen) will support X client applications that only require 1 bit per pixel.

- Click the Color button, and screen zero (the default screen) will support X client applications requiring 8-bit color.

- The Screen Zero option is preset to Match Best Monitor. With this selection, MacX configures the default screen in either of two ways:
  - as an 8-bit color screen if your monitor is set for greater than 1 bit per pixel
  - as a 1-bit monochrome screen if your monitor is set for 1 bit per pixel (black and white)

- The screen zero option is preset to Rootless. With this selection, X clients that connect to the default screen are displayed in rootless mode; that is, they are managed by the Macintosh Window Manager alongside other Macintosh application windows.

- Click the Rooted button, and X clients that connect to the default screen are displayed in rooted mode; that is, they are drawn on an X

root window and must be managed by a foreign (remote) window manager.

- The Disable Non-zero Screens option is preset to "enabled." With this selection, all screens other than the default screen (screen zero) are ignored by MacX. As a result, client applications that are designed to connect only with screen zero are displayed correctly on the MacX server because multiple screens are no longer available. To turn off this option, click the checkbox to remove the "X" from the box.

4) Click the OK button to confirm your preferences.
   An alert box appears to report that your preferences will not be enabled until the MacX file, or document, is reopened.

5) Click the OK button to dismiss the alert box.

6) Save, close, then reopen the MacX document to enable your new display preferences.

For more information about rooted and rootless windows, see Chapter 1 of your MacX User's Guide.

Support for Backing Store and Save Under to Preserve Client Windows
---
MacX now provides Backing Store and Save Under features as defined by the X Window System standard.

By default, Backing Store and Save Under support are given to those client applications that require the MacX server to preserve window contents. Typically, these X clients create complex graphic images that can take a substantial amount of time to refresh. By taking advantage of Backing Store and Save Under, X client applications can greatly reduce the time they need to refresh their windows.

These new capabilities, however, may incur an additional memory cost to your MacX application program because the MacX server must set aside additional memory to preserve portions of client windows.

- Backing Store and Save Under may consume additional memory. In the course of providing Backing Store and Save Under to X client applications, MacX may use additional memory. As a result, you may want to increase the "application memory size" of MacX. For more information, see "Can't Use a MacX Feature," in Chapter 6 of your MacX User's Guide.

Backing Store and Save Under features are set by default to provide you with the level of support required by most X client applications. Experienced users of the X Window System, however, may want to adjust this level. For example, you can disable Backing Store entirely or force it on every window of every X client. In addition, you can disable Save Under entirely.

Follow these steps to change the level of Backing Store capability.

1) Open the MacX application program by double-clicking its icon.

2) Choose the Display Preferences command from the Edit menu.

3) Click the Backing Store option that corresponds to the level of feature support needed.

   - Click the Off button to disable the Backing Store feature entirely. With the feature in this state, client applications must redraw their windows each time they are exposed. You save computer memory, but you may have to wait for some client windows to redraw themselves when Backing Store is turned off. The amount of computation time needed to redraw the client window depends on the client application itself, the network bandwidth, and the speed of your computer.

   - The Backing Store feature is preset to Requesting Clients. This selection enables the Backing Store feature only for the windows of client applications that request it. Clients that do not request Backing Store may redraw their windows more slowly than those with the feature enabled.

   - Click the All Windows button to provide Backing Store capability for all client application windows, regardless of whether or not they request it. With the feature in this state, you typically use additional computer memory but get the benefit of not having to wait for client windows to redraw themselves each time they are exposed. Because many clients (particularly those that primarily draw text) perform worse with Backing Store enabled, this setting should be used with caution.

4) Click the Save Under option that corresponds to the level of feature support needed.

   - Click the Off button to disable the Save Under feature. With the feature in this state, client applications must redraw their windows each time they are exposed. You save computer memory when Save Under is turned off, but you may have to wait for some client windows to redraw themselves.

   - The Save Under feature is preset to Requesting Clients. This selection enables the Save Under feature only for the windows of client applications that request it. When a window requesting Save Under is displayed on your monitor, the contents of windows behind it are saved (even if they didn't request Backing Store); when the window is dismissed, the saved contents are restored. Save Under is used mainly for transient windows such as menus and dialog boxes.

5) Click the OK button to confirm your preferences.
   An alert box appears to report that your preferences will not be enabled until the MacX file, or document, is reopened.

6) Click the OK button to dismiss the alert box.

7) Save, close, then reopen the MacX document to enable your new display

preferences.

Greater Client Compatibility with colormaps

MacX 1.2 makes all 256 entries of each screen's default colormap available for use by X client applications. A default "standard" colormap is no longer installed automatically by MacX. This change provides support for those X client applications that require many free colormap entries in the screen's default colormap.

Earlier versions of MacX installed a standard colormap as the screen default colormap, leaving only 128 empty colormap entries available for client allocation. This caused problems with clients requiring that more than 128 colormap entries be available in the default colormap.

If your particular X application expects a standard colormap to be present in the screen default colormap, follow these steps to load the standard colormap:

1) Open the MacX application program by double-clicking its icon.

2) Choose the Misc. Preferences command from the Edit menu.

3) Click the Load Standard Colormap at Startup checkbox.

4) Click the OK button to confirm your preferences.
   An alert box appears to report that your preferences will not be enabled until the MacX file, or document, is reopened.

5) Click the OK button to dismiss the alert box.

6) Save, close, then reopen the MacX document to load the standard colormap.

• Are you having trouble displaying a color X client on your MacX server alongside other color clients? Try displaying the troublesome client application on your MacX server by itself. Your other X clients may have filled up the colormap, and the troublesome application, finding the colormap already full and not requesting MacX to create a new one, fails to run. By running only the troublesome X client application, you allow it to take advantage of all the colormap entries it needs since no other applications are competing for colormap entries.

Faster Display of Client Applications, with Smoother Animation Turned Off

Smoother (but Slightly Slower) Animation is no longer enabled by default, with the result that client applications may be displayed more quickly on your MacX screen.

The Smoother Animation option regulates how often MacX responds to client graphics requests. With this option turned off, client graphics requests are batched for approximately one-sixth of a second before executing to prevent constant screen refreshing—a time-consuming process.

With Smoother Animation turned on, client graphics requests are rendered immediately, meaning that client applications may be displayed more slowly on your monitor than with the feature turned off.

Depending on your needs, you can enable Smoother Animation anytime. Follow these steps:

1) Open the MacX application program by double-clicking its icon.

2) Choose the Misc. Preferences command from the Edit menu.

3) Click the Smoother (but Slightly Slower) Animation checkbox.

4) Click the OK button to enable your new preference and to dismiss the preferences window.

For more information about animation preferences, see the section "Animation and Mouse-Movement Preferences" in Appendix A of the MacX User's Guide.

Easy Client Access to MacX, with Host Access Alert Boxes Turned Off
---
Host access alert boxes are no longer enabled by default, allowing unrestricted access by client applications to MacX. As a security feature, the following alert box, if enabled, appears automatically when clients attempt to connect to MacX. The alert box requests your permission to accept connections from the client.

This alert box may appear several times in the course of establishing a connection. With the alert box suppressed, you no longer have to respond to it before clients can connect to MacX. However, this also means that you no longer have control over client connections.

Depending on your needs, you can enable the host access alert box at any time. Follow these steps:

1) Open the MacX application program by double-clicking its icon.

2) Choose the Access Control command from the Remote menu.

New Window Commands for Easier Window Control

Three new commands have been added to the Window menu to give you greater convenience when controlling windows.

Circulate Up (Cmd-U) This command causes the window farthest back in the collection of MacX windows to be brought to the front of the stack. This is handy for switching between windows easily without removing your hands from the keyboard to use the mouse.

Circulate Down (Cmd-D) This command causes the front most window in the collection of MacX windows to be sent to the back of the stack. This is

handy for switching between windows easily without removing your hands from the keyboard to use the mouse.

Maximize Height/Restore Height (Cmd-M) This command, which is only enabled when the front most window is a rootless X client window, makes the front most window taller by extending its bottom edge to the bottom of the screen. If the front most window has already been extended in this way, the command restores the window's previous height.

Window Dimensions Reported During Resizing

While rootless X windows are being resized, the size of the window in client-specified units (normally, pixels for graphics or characters for text-oriented clients such as terminal emulators) is displayed in the menu bar.

Macintosh LC III, Performa 450: 16-Bit Color in 512K VRAM (4/93)

Revised: 5/4/93
Security: Everyone

Macintosh LC III, Performa 450: 16-Bit Color in 512K VRAM (4/93)

==========

Article Created: 30 April 1993

TOPIC ----------

This article describes a setting that enables the Macintosh LC III and Performa 450 to display images at 16 bits per pixel -- though with a smaller screen area -- without adding optional video RAM above the 512K included with the computer.

DISCUSSION ----------

The AppleColor High-Resolution RGB Monitor, Macintosh Color Display, and Macintosh 12" Monochrome Display can be set to display images of 16 bits per pixel with just the 512K of video RAM included with the Macintosh LC III and Performa 450. But to obtain the higher depth, the active screen area is reduced from the normal size 640 x 480 pixels to 640 x 400 pixels.

To turn on this option, open the Monitors control panel and click on the Options button. Choose the 640 x 400 pixel display mode, and restart the computer. The screen window will be at the same resolution as that of a PowerBook display, shorter at 400 pixels than in normal display mode. You can then set the monitor to thousands of colors, instead of the 256 colors available in 640 x 480 mode.

Adding the optional VRAM upgrade will allow the monitor to display thousands of colors in normal (640 x 480) pixel mode.

DAL 1.3.5: VM/CMS ESA Connection (4/93)

Revised: 5/18/93
Security: Everyone

DAL 1.3.5: VM/CMS ESA Connection (4/93)

==========

Article Created: 29 April 1993

TOPIC ----------

I will be installing DAL 1.3.5 for VM/CMS on an ES/9000 mainframe with the VM/ESA Operating System. I have an installation of about 200 Macintosh computers. For host access I use Avatar's MacMainFrame via coax to a 3174 Unit Controller and I have to make the installation via this path.

Only one Unit Controller is available to make the connection and this unit is configured as non-SNA. It's this way because this is the controller that attaches to the system console.

Here are my questions:

1) I have release 3.2 of Avatar MacMainFrame. I should have no problems accessing the non-SNA Control Unit because Avatar supports CUT, NLCA, and DFT, but is there a compatibility problem with Avatar MacMainFrame 3.2 and DAL 1.3.5?

2) I also want to make a SNA•ps connection. I've read DAL supports CUT, NLCA, and DFT access using MacDFT through the 3270mac network adapter. Does the SNA•ps 3270 driver support CUT and NLCA through the 3270mac network adapter? I don't think it does, but I would like confirmation of this.

3) If CUT and NLCA access through the SNA•ps 3270 driver is not supported, can I make the connection through a SNA•ps gateway using the DALnet SNAps3270 network adapter via a non-SAN control unit?

DISCUSSION ----------

There is more to this issue than just the questions you have asked. Here are the answers to your questions:

1) DAL 1.3.5 does not work with MacMainFrame 3.2. That is a very old release and has not been supported by Avatar for quite some time. You need to get release 4.0.1 at least before you will be able to work with DAL 1.3.5 successfully.

2) DAL supports the SNA•ps 3270 connection only through the DALnet SNAps3270 network adapter. This network adapter is only available in the DAL Client release 1.3.5 or greater. This connection uses the SNA•ps 3270 API and requires a SNA•ps 3270 gateway.

3) Both CUT and NLCA are usually single-session coax connections. It is not possible to run a gateway over a single session, non-SNA connection. DAL uses the SNA•ps 3270 API and that requires a SNA Gateway. So, no you can't put a SNA•ps gateway on this controller. You could use the SNA•ps 3270, not the GC (Gateway Client), product to show that the emulator works, but that will not work with DAL as it uses the SNA•ps 3270 API -- the 3270 emulator does not use the 3270 API.

Now, for another issue: With VM/XA and VM/ESA (as opposed to VM/SP) operating systems, IBM does not support the SQL command "Connect to Database", which DAL does support -- as it is available in VM/SP systems.

Since DAL supports this command, there is a possibility that the installation of the DAL Server could run into a problem when doing the SQL Prep of the Access Module (page 7 on the DAL Server for VM Installation Guide). If the SQL Prep process takes exception to the "Connect to Database" command, simply comment those commands out in the CL1DBI01 TEXT module and rerun the SQL Prep process.

Regardless of whether the SQL Prep process has a problem with the inclusion of that command, there is work that needs to be done to allow users to access the database when the installation is complete.

The Environment file (ENV DAL) must be updated to have the first line, SSID= changed to:

```
SSID=@SQL
```

The use of "@SQL" is a key to the DAL Server to NOT attempt to issue the "Connect to Database" command.

It is necessary that the SSID= field in the environment file be changed because commercial applications like ClearAccess™ require the user to select a database name from a list. If the actual database name were listed, and the user selected it, DAL would attempt to issue the command that is not supported and the user would never be able to connect.

It is also possible to use a null value ('' -- quotes with no space inside) instead of the @SQL value. This will only work where the application supports the entry of the database name and supports a null value.

For example, if the user used the DAL Tester, then his Open Database

command could use either @SQL or a null as the value of the database name:

```
    Open SQLDS dbms;
    Open database '';
```

or:

```
    Open SQLDS dbms;
    Open database '@SQL';
```

MacX 1.2: File Compatibility with Earlier MacX Versions (4/93)

Revised: 5/4/93
Security: Everyone

MacX 1.2: File Compatibility with Earlier MacX Versions (4/93)

==========

Article Created: 29 April 1993

TOPIC ----------

This article describes compatibility with MacX 1.2 of files created in earlier versions of MacX.

DISCUSSION ----------

Your MacX 1.1.7 documents are fully compatible with MacX 1.2. If you are in MacX 1.2 and open documents created with earlier versions of MacX, you are presented with an alert box that asks you to preserve or update your default settings. You have two options:

- If you click the Update Defaults button, the default settings of MacX 1.2 are applied to the MacX document that was created with an earlier version of MacX.

  The Update Defaults selection provides you with increased compatibility with all X client applications, and you may recognize some improvements in performance.

- If you click the No Change button, the old default settings are carried over to the newly converted document.

MacX 1.1.7: Read Me Technical Information (4/93)

Revised: 5/18/93
Security: Everyone

MacX 1.1.7: Read Me Technical Information (4/93)

==========

Article Created: 29 April 1993

TOPIC ----------

This article contains technically-oriented information about MacX 1.1.7.

DISCUSSION ----------

A/UX and MacX now support floppy disks just as Command Shell does: it permits floppies to be used either for Macintosh disk format or for Unix data. When a disk is inserted, a dialog is displayed which is similar to the one presented by Command Shell under similar circumstances. This dialog permits the user to choose between Macintosh format and Unix disk usage, or to eject the disk in case it was inserted accidentally. Floppy disks which are not in Macintosh format will be accepted silently, and disks which have not yet been formatted will result in a dialog which permits the disk to be initialized as a Macintosh disk.

Several new features have been added to MacX 1.1.7 to make the MacX window manager more convenient to use. Three commands have been added to the Window menu to support these new features. Also, while rootless X windows are being resized, the size of the window in client-specified units (normally pixels or, for text-oriented clients like terminal emulators, characters) is displayed in the menu bar.

Circulate Up (Cmd-U)

This command causes the bottom-most window in the collection of MacX windows to be brought to the top of the stack. This is handy for switching between windows easily without removing your hands from the keyboard to use the mouse to do so.

Circulate Down (Cmd-D)

This command causes the top-most window in the collection of MacX windows to be sent to the bottom of the stack. This is handy for switching between windows easily without removing your hands from the keyboard to use the mouse to do so.

Maximize Height / Restore Height (Cmd-M)

This command, which is only enabled when the front-most window is a rootless X client window, can be used to make the front-most window taller by extending its bottom edge to the bottom of the screen. If the front most window has already been extended in this way, the command restores the window's previous height.

MacX 1.2 Documentation Navigation Aids, Release Notes (4/93)

Revised: 5/18/93
Security: Everyone

MacX 1.2 Documentation Navigation Aids, Release Notes (4/93)

==========

Article Created: 29 April 1993

TOPIC ----------

If you're already using MacX 1.1.7, you need to read only the MacX 1.2 Release Notes and the documentation it references. You don't have to reread the MacX 1.1.7 Release Notes unless you want to familiarize yourself with its features.

DISCUSSION ----------

The MacX documentation includes the MacTCP Administrator's Guide, version 1.1, and revised installation procedures for system software version 7.x. These procedures are described in the MacX Installation Guide.

To navigate through the MacX documentation, follow these steps:

- If you're new to MacX, read the MacX 1.1.7 Release Notes first, then read the MacX 1.2 Release Notes. If you're already a user of MacX 1.1.7, you need to read only the MacX 1.2 Release Notes.

- Follow the instructions in the MacX Installation Guide to install the MacX application program.

  If you're running MacX on system software version 6.0.x, make sure you read Chapter 3, "Setting Up Communications," in the MacX Installation Guide to learn how to install the Macintosh Communications Toolbox.

- Follow the instructions in the MacTCP Connection Tool Module to install MacTCP and configure the MacTCP driver.

- Read the MacX User's Guide to learn how to use MacX. If necessary, refer back to these release notes for information about MacX 1.2 features not described in the MacX User's Guide.

MacX: Updating to Version 1.2 (4/93)

Revised: 5/18/93
Security: Everyone

MacX: Updating to Version 1.2 (4/93)

==========

Article Created: 29 April 1993

TOPIC ----------

This section provides instructions about updating your older release of MacX to version 1.2.

DISCUSSION ----------

With the MacX 1.2 Update product, you receive the following items:

- MacX 1.2 Release Notes
- MacX 1.1.7 Release Notes
- MacTCP Administrator's Guide, version 1.1
- MacX Application disk
- MacX Communications disk
- Communications 1 disk
- Network Products Installer disk

To update to MacX 1.2, perform these steps:

- Install the MacX 1.2 application program, located on the MacX Application disk.

  If you're not using A/UX, go to Chapter 2, "Installing MacX," of the MacX Installation Guide. Follow the instructions that apply to your Macintosh computer's hardware and software configuration. You do not have to reinstall the other files on the MacX Application disk (MacX Colors file, Sample, and so on).

  - A/UX users: Replace your version of MacX with the one on your new MacX Application disk. Unless you've moved your MacX program, you'll find it in the /mac/MacX/ directory. As soon as you replace the program, you can begin using it. If you don't have permissions to

access this directory, see your system administrator.

- If you're not using A/UX, install the MacTCP 1.1.1 driver located on the MacX Communications disk.

  Go to the MacTCP Connection Tool Module in the MacX Binder. Follow the instructions that apply to your Macintosh computer's hardware and software configuration to install and configure MacTCP 1.1.1.

  - A/UX users: The version of MacTCP that resides in your Control Panels folder is customized for A/UX only. Do not use the MacTCP 1.1.1 driver that's included on the MacX 1.2 Communications disk. MacTCP 1.1.1 supports the Macintosh Operating System only, not A/UX.

The Communications 1 disk and the Network Products Installer disk are included in your MacX 1.2 Update product in the unlikely event that you need to reinstall the Communications Toolbox on your computer. Read Chapter 3, "Setting Up Communications," in the MacX Installation Guide for instructions about installing the Communications Toolbox on system software version 6.0.5, 6.0.6, or 6.0.7. If you're using version 7.0 or later, or you're using A/UX, you don't need to install the Communications Toolbox; it is built into system software versions 7.0 and later.

MacX Technical Notes (4/93)

Revised: 5/18/93
Security: Everyone

MacX Technical Notes (4/93)

==========

Article Created: 29 April 1993

TOPIC ----------

This article contains Technical notes from the MacX 1.1.7 Release Notes on:

- Full 256 Color Colormaps and Color Update
- Differences Between MacX and Other X11R4 Servers.

DISCUSSION ----------

Full 256 Color Colormaps and Color Update

MacX no longer requires that black and white colors occupy pixel values #255 and #0 (respectively) in colormaps in order to animate colormaps. Clients that require all 256 colormap entries and set entry #0 and/or entry #255 to colors other than white and black, respectively, will cause the Macintosh user interface to look strange while the client's windows are front-most. This condition is temporary and can be alleviated to make the menu bar and other Macintosh features more visible either by converting such windows to an icon (using Command-I, for example) or by switching to another MultiFinder application.

MacX updates the colors in windows displayed by other applications several seconds after the last X11 colormap operation modifies the color environment. This is to permit "batching together" of colormap operations and updates of other applications' windows to improve MacX's color performance.

Differences Between MacX and Other X11R4 Servers

MacX ignores X11 requests ChangeHosts, SetAccessControl, SetScreenSaver, ForceScreenSaver, SetFontPath, ChangeKeyboardControl. For rootless screens, MacX ignores GrabPointer and GrabButton (with a confine-to

window). In order to live comfortably in both the X11 and Macintosh worlds, MacX must make a few concessions to both worlds' diverse requirements and capabilities. Access control is implemented on MacX solely based on a per-connection go/nogo decision made by the user. The screen saver functionality in X11 is not present in MacX since this would interfere with the Macintosh's other uses. Font path searching is not present — MacX implements a hierarchical font directory scheme that does not require manually updating a master list of available fonts every time a change is made. All X11 requests for changing keyboard and bell sound settings or for confining the mouse pointer to a given portion of the screen are contrary to the Macintosh world and have no effect in MacX.

MacX Troubleshooting (4/93)

Revised: 5/18/93
Security: Everyone

MacX Troubleshooting (4/93)

==========

Article Created: 29 April 1993

TOPIC ----------

This article describes technical troubleshooting information, and covers the following areas:

- MacX and the Macintosh Display Card 8•24 GC
- 32 Bit QuickDraw
- Default Colormap and Colormap Errors from Client
- Remote Command and Ultrix 4.0
- Remote Commands and Sun OS.

DISCUSSION ----------

MacX and the Macintosh Display Card 8•24 GC

Use of MacX with a Display Card 8•24 GC in "millions" mode can cause crashes. This is due to a problem in which the Display Card 8•24 GC fails to properly support color cursors in the Display Card 8•24 GC software version 1.0. Since MacX only supports 8 bits per pixel (256 colors), use of the Display Card 8•24 GC in that mode is a good work-around for this problem until it can be fixed in the Display Card 8•24 GC support software. Also, due to the way MacX and the Display Card 8•24 GC work, it may be faster to use MacX with the Display Card 8•24 GC card's acceleration turned OFF.

32 Bit QuickDraw

MacX requires the presence of 32-bit QuickDraw to support one feature: the conversion of color PICTs to X11 selections. If you do install 32-bit QuickDraw on your machine (or have a machine at least as new as a Macintosh IIci), you will have this capability — MacX will offer to convert clipboard contents to color PIXMAP and COLORMAP style. If MacX can't find the 32-bit

QuickDraw features, MacX will only offer to convert to BITMAP.

Note that 32-bit QuickDraw also adds some performance enhancement and bug fixes on machines older than the Macintosh IIci. Also note that 32-bit QuickDraw is built into System 7.0 and later for all machines that support Color QuickDraw.

Default Colormap and Colormap Errors from Client

Some X11 clients ("xgif", for example) complain when attempting to display a large number of colors simultaneously on MacX color screens. This is because the clients are constructed based on the assumption that there are many free colormap cells in the default colormap. MacX always installs the standard X11 colormaps, created in a manner analogous to those created by the MIT "xstdcmap" client, for both screen #2 and screen #3. If a client attempts to allocate more than the number of colormap entries left unused by the currently-installed colormap, it gets an error. This problem sometimes causes "grainy" color picture displays (in xgif) or may cause error messages issued by some clients. The problem is caused by an invalid assumption the client is making — that it will be able to write all or nearly all of the colormap cells of the default colormap. Clients that do this should be modified so they create their own (initially empty) colormap and set the contents of that colormap instead.

Remote Command and Ultrix 4.0

Users of remote commands with Ultrix 4.0 machines may find that MacX is unable to connect and run remote commands on that system. This is due to a problem with the Ultrix 4.0 rexecd network daemon, which does not occur in older versions of Ultrix. This problem is fixed in Ultrix 4.1 and later.

Remote Commands and Sun OS

Users of remote commands with Sun workstations may find that their remote commands appear to do nothing and there is no output from the Sun workstations. This is due to a feature of the Sun rexecd network daemon which quietly disconnects from requesting machines that are not known to the Sun's network address (/etc/hosts or NIS hosts) database. To successfully use remote commands with a SunOS-based machine, there must be an entry in the network address database for the Macintosh which is running MacX.

Color Classic: Apple File Exchange Error Message (8/93)

Revised: 8/31/93
Security: Everyone

Color Classic: Apple File Exchange Error Message (8/93)

==========

Article Created: 4 May 1993
Article Reviewed/Updated: 30 August 1993

TOPIC ----------

On the Macintosh Color Classic, opening Apple File Exchange sometimes gives a type 1 error or the message "Application unknown has unexpectedly quit." You need to install the Hardware System Update to resolve this.

DISCUSSION ----------

There's a known problem with the Color Classic and Apple File Exchange, where Apple File Exchange will crash or not operate correctly. The problem was fixed in the Hardware System Update. Install the Hardware System Update on a Macintosh Color Classic to fix the Apple File Exchange problem.

Without the update, there were problems when running in both 24- and 32-bit mode. However, a crash normally only resulted when running Apple File Exchange in 24-bit mode. This is why some articles suggested running in 32-bit mode with Apple File Exchange on a Color Classic.

Installing the Hardware System Update resolves this issue, and the Color Classic can then run in either 24- or 32-bit mode.

You can find the Hardware System Update on AppleLink following this path:

Software Sampler
Apple Software Updates
Macintosh
Supplemental System Software

LaserWriter Select 310: Only Supports PostScript Level I (5/93)

Revised: 5/14/93
Security: Everyone

LaserWriter Select 310: Only Supports PostScript Level I (5/93)

==========

Article Created: 4 May 1993

TOPIC ----------

Why does Apple only support PostScript Level I on the LaserWriter Select 310?

DISCUSSION ----------

Apple used PostScript Level I on our LaserWriter Select 310 because overall it's a less expensive solution. Since the printer was geared as an entry-level solution, there were a couple of major reasons for using PostScript Level I:

- PostScript Level II requires more RAM in the printer, and thus would increase the cost of the printer.
- The features that PostScript Level II provides will most likely not be an issue with entry-level users.

LaserWriter: Automatic Setup with Spooled LaserWriter (5/93)

==========

Article Created: 5 May 1993

TOPIC ----------

The SETUP command in the Chooser does not work when my LaserWriter Pro 630 is captured by AppleShare PrintServer 3.0.1. I'm using LaserWriter driver 7.2 and as I understand, SETUP needs to be performed in order to display the paper source and imaging options of the printer in the Print dialog box. How can I "SETUP" my spooled LaserWriter Pro 630?

DISCUSSION ----------

The automatic SETUP feature does not work when a LaserWriter is spooled. To use this feature on a spooled LaserWriter, hold down the OPTION key when selecting SETUP. This is a power-user feature that will enable the user to manually select the type of printer connected and the options installed -- such as the 500-sheet tray. Once this is done, all of the available printer options will show up correctly in the Print dialog box.

Macintosh PC Exchange: Version 1.0.2 Update (5/93)

Revised: 7/2/93
Security: Everyone

Macintosh PC Exchange: Version 1.0.2 Update (5/93)

==========

Article Created: 5 May 1993

TOPIC ----------

This article discusses version 1.02 of Macintosh PC Exchange.

DISCUSSION ----------

Version 1.0.2 resolves several technical problems reported by PC Exchange customers and is available to customers at no charge.

Mac PC Exchange 1.0.2 doesn't include any new features or enhancements over the previous version 1.0.1, but incorporates fixes for the following problems:

- PC Exchange 1.0.1 wouldn't recognize certain brands of pre-formatted PC floppy disks. Instead, PC Exchange asked users if they wanted to initialize the floppy disk. Version 1.0.2 of PC Exchange should now recognize all brands of PC-format floppy disks, regardless of the method used to pre-format the disk.

- Occasionally, the first file that users selected from a locked, PC-format floppy disk wouldn't open, or the content of the document would appear as garbage characters. If users unlocked the floppy disk, all files on the PC-format disk would open without difficulty. With version 1.0.2 of PC Exchange, you can open documents from a locked, PC-format floppy disk without problems.

- When PC Exchange initializes a floppy disk that is damaged, the initialization process can take a long time to update the damaged disk. Version 1.0.2 of PC Exchange displays a new message while a damaged disk is being updated. This message reports the progress of the disk update and gives the option to cancel the disk initialization.

- If there isn't enough free space in the application heap, a format failure or system crash could occur when PC Exchange is formatting a PC floppy disk. This problem shouldn't occur with version 1.0.2 of PC Exchange.

The Macintosh PC Exchange 1.0.2 update kit includes an 800K program disk and a cover letter.

VINES 5.50(1) AFP Problem With Drop Boxes (5/93)

Revised: 5/18/93
Security: Everyone

VINES 5.50(1) AFP Problem With Drop Boxes (5/93)

==========

Article Created: 6 May 1993

TOPIC ----------

I've been working with Banyan Systems on an AFP and privileges problem. The Banyan VINES server doesn't seem to support drop boxes properly. I've set up each user in a workgroup with a single folder, at the workgroup server's volume root, with owner privileges; then the other user's folders are drop boxes.

The environment is as follows:

- Banyan server is a Banyan CNS, 8MB RAM
- Server SW is VINES 5.50(1)
- 3Com Etherlink II, with thin Ethernet
- ATT StarLan10 and an ICA card
- Macintosh computers varying with System 6.0.8 or 7.0.1

Two problems were uncovered, and I'm wondering if it's AppleShare working as expected or Banyan related.

Here is the scenario, call the users UserA and UserB:

1) UserA has a folder containing files on his hard drive. If this folder is dragged onto their server folder, the data copies successfully.

   If UserA drags this folder onto UserB's server folder (seen as a drop box), part way through the copy a message appears, folder cannot be written because it can't be found. Then a second error is displayed, the (contained) file cannot be copied due to a disk error.

   An unacceptable workaround is to copy the local folder to your own server folder, and then drag it onto the drop box destination. This creates a two step process which also introduces issues related to the privileges of the moved folder.

2) UserA has copied the local folder to UserB's drop box and received the mentioned errors. UserB looks in his folder and sees a "belted" folder. When I Checked "Sharing..." from the File menu for the received folder, it showed Owner=UserA and no privileges for anyone else. This received folder shouldn't have those rights assigned to it. After changing the privileges I found nothing in the received folder.

Any help determining an effective way to create functional drop boxes on VINES 5 would be appreciated.

DISCUSSION ----------

These behaviors are definitely not typical for AFP. Drop boxes should not issue any type of error message when something is "dropped" into them. The contents of the drop box should most definitely be visible to the box owner.

We escalated the issue to Banyan Support and the response from Technical Support and Engineering was as follows:

- The current revision 5.50(1) doesn't support folders dropped into drop boxes.

- The new revision 5.52(5) doesn't support folders dropped into drop boxes.

- There was no time estimate on when this feature will be supported.

You may want to ask Banyan Systems for some possible workarounds to provide "similar" functionality.

To locate a vendor's address and phone number, use the vendor name as a search string.

Printing Differences: Lines Per Inch and Dots Per Inch (5/93)

Revised: 5/14/93
Security: Everyone

Printing Differences: Lines Per Inch and Dots Per Inch (5/93)

==========

Article Created: 11 May 1993

TOPIC ----------

The Apple Color Printer spec sheet says the printer has 360 dots per inch, but it also says the printer has 65 screen lines per inch. Can you explain the difference between lines per inch and dots per inch?

DISCUSSION ----------

Dots per inch (dpi) represent the quantity of dots per inch a printer is capable of putting onto paper. Dots per inch is also known as the resolution of the printer.

Lines per inch (lpi) represent the number of halftone dots (per inch) that a screen contains Lines per inch is also referred to as the screen frequency or screen ruling.

The halftone dot is quite different from the dpi dot. The halftone dot can actually be a variety of shapes: lines, ellipsoids, squares, dots, random flecks, and a variety of other solid black shapes. Typically dots and ellipsoids are used. However, for the more artistic representations other shapes are often used. The number of shapes per inch is measured by lines per inch, that is, shapes per inch equals lines per inch.

With the exception of daisy wheel type printers, output from computers has always been based on a quantity of dots placed together to represent alphanumeric characters and graphics. The first printers of this nature were the dot matrix printers. Laser printers and ink jet printers use this same principal. The laser and ink jet dots are smaller than the dot matrix printers, but they work the same way. The number of dots these printers produce is the measured in the dots per inch (dpi) notation.

Prior to the use of the dot based printers the pre-press/printing industry used various methods of placing solid forms of ink onto paper (gravure, letterpress, offset, and so on.). These methods do not use dots to form the alphanumeric characters. Similar to the daisy wheel printers, the characters are fully formed ink impressions. The problem with using solid ink comes when attempting to print graphic images which consist of more than solid lines or solid blocks (line art). Some method to vary the amount of ink placed on the paper is needed in order to represent various levels of gray. Otherwise, printing photographs and other continuous tone artwork would not be possible.

To address this need, a technique was developed to print various sized black halftone dots on the paper. An area of various sized, solid black halftone dots will trick the eye into thinking it is seeing various levels of gray.

In the traditional technique used to create these various sized dots a screen is placed over the photographic enlargement paper to break the continuous-tone photograph into halftone dots. A screen can best be described as a sheet of plastic which contains the inverse (negative) gray scale pattern of halftone dots. This sheet of semi-transparent plastic allows varying amounts of light to pass through and contact the photographic paper placed beneath it. In the computer technique, there is no physical screen used. The halftone dots are created via computer image processing.

The number of halftone dots in the screen is represented by the lines per inch (lpi) measurement. That is, 65 halftone dots per inch equals 65 lines per inch. The number of halftone dots per inch for a screen can vary. Typical values are 65 lpi for newspaper photograph halftones to 200 lpi (or higher) for art reproduction books.

There is a relationship between dpi and lpi. The relationship exists as a limit. The lpi of a printer will always be less than the dpi of the printer, because the halftone dot is composed of a matrix of the dpi dots. Higher dpi does not directly indicate higher lpi, only the possibility of higher lpi. Both a 300 dpi printer and 600 dpi printer can produce halftone dots of (possibly) 53 lpi, 75 lpi, 83 lpi, 106 lpi, and 150 lpi, but the 600 dpi printer would be able to produce additional, higher lpi.

Personal LaserWriter NTR: Some TrueType Fonts Won't Print 7/93

Revised: 7/19/93
Security: Everyone

Personal LaserWriter NTR: Some TrueType Fonts Won't Print 7/93

==========

Article Created: 13 May 1993
Article Reviewed/Updated: 12 July 1993

TOPIC ----------

I have a Personal LaserWriter NTR that won't print three of my TrueType fonts: Old English, Oxford, and Zeal (these are fonts that came with my printer). It won't print in Microsoft Works 3.0, Microsoft Word 4.00c or PageMaker 4.2. If a document contains one of these fonts on page two, it only prints page one. I tried turning extensions off, but that didn't work. My printer whirs, the busy light blinks, then stops, then the light blinks again and stops.

The printer prints all other fonts just fine in all my applications.

I'm using a Macintosh LC II running System 7.0.1. No other devices are connected to this printer.

DISCUSSION ----------

This problem can be resolved by upgrading to version 7.1.2 of the LaserWriter driver.

This assumes you are currently using version 7.1.1 of the LaserWriter driver. This is a known problem with version 7.1.1 and is mentioned in an article in the Technical Information Library titled, "LaserWriter Driver 7.1.1 and 7.1.2: Differences."

The article reads:

> "Fix for a very rare bug when printing to a Personal LaserWriter NTR with some TrueType fonts: the printer purges the current job and restarts."

If you have access to AppleLink, you can find a copy of the 7.1.2 driver by following this path:

Software Sampler
  Apple SW Updates
    Macintosh
      Printing Software
        LaserWriter (7.1.2)

NOTE: If you are using a Performa 400, 405, or 430, you may run into the same problem.

Stylewriter: Printed Box is Too Short (5/93)

Revised: 5/24/93
Security: Everyone

Stylewriter: Printed Box is Too Short (5/93)

==========

Article Created: 10 May 1993

TOPIC ----------

When I create a 7.5 x 10.0 inch box in any graphics application and print it on my StyleWriter II, the printed box only measures 7.5 x 9.95 inches on the page. In contrast, the HP DeskWriter prints the same image at 7.5 x 10.0 inches.

What causes this?

DISCUSSION ----------

The .5 percent reduction in page length occurs because the StyleWriter II, as well as the original StyleWriter, utilize paper underfeeding to prevent horizontal banding. Paper underfeeding, in effect, overlaps each print head pass to create a "blending effect" of the printed lines. The drawback, however, is that this minute underfeeding has a cumulative effect over the length of the page and thus results in the .5 percent discrepancy in page length.

The HP DeskWriter also utilizes paper underfeeding, but it has a smaller cumulative effect since it is a 300 dpi printer. At 300 dpi, the dot size is correspondingly larger and thus requires fewer print head passes to print an image. This gives less cumulative underfeeding.

Since the original StyleWriter and the StyleWriter II are 360 dpi printers, their dot size is smaller and so requires more print head passes to create a page.

AppleCD 300: Differences Between Modes and Speed (5/93)

Revised: 5/24/93
Security: Everyone

AppleCD 300: Differences Between Modes and Speed (5/93)

==========

Article Created: 11 May 1993

TOPIC ----------

In the AppleCD 300 User's Guide, both mode and speed are mentioned. I was under the impression that normal speed was mode 1 and double speed was mode 2.

Can you please explain the difference between mode and speed?

DISCUSSION ----------

In respect to CDs, modes refer to the format of the various fields written on the compact disk (such as sync, header, data, ECC, etc.). The different modes are not a function of different drive speeds, and can be used at both single and double speed.

The AppleCD 300i and the external AppleCD 300 will play the following types of compact disks:

CD-Audio
CD-ROM (modes 1 and mode 2)
CD-ROM XA (mode 2, form 1 and form 2)
CD-I (mode 1 and mode 2)
CD-I Ready
CD-I Bridge
Photo CD (single and multiple sessions)

Retrospect: Error 206 (media failure) (8/93)

==========

Article Created: 13 May 1993
Article Reviewed/Updated: 19 August 1993

TOPIC ----------

Recently I have been involved with a network backup problem involving AppleShare 2.0, Retrospect, and different backup drives: PL/I, and Mac Warehouse DAT (Digital Audio Tape) drives with different tapes. Retrospect reported an error 206 which indicates a media failure.

Will the Apple DAT (Digital Audio Tape) drive work with Retrospect?

DISCUSSION ----------
Yes, the Apple DAT (Digital Audio Tape) drive will work with Retrospect.

Error 206 (media failure) is reported when there is trouble reading from or writing to the media. This error is always generated by the backup device, and is usually due to one of four causes:

- The media is physically defective and needs to be replaced. Try using a different tape or cartridge.

- Another SCSI device is causing interference. If you have a DAT drive immediately next to a Seagate hard disk, try moving the DAT drive to a point further away on the SCSI bus. Try removing one or more devices temporarily to see if there is some other device conflict.

- The heads on the tape drive are dirty and need to be cleaned. Consult the manual that came with your tape drive or contact the drive manufacturer for cleaning recommendations.

- The tape device is failing. Contact the manufacturer.

For further information on working with Retrospect and Retrospect A/UX, search the Tech Info Library by "Retrospect" or "Remote."

AppleTalk Remote Access Instructions (9/94)

Revised: 9/29/94
Security: Everyone

AppleTalk Remote Access Instructions (9/94)

==========

Article Created: 11 May 1993
Article Reviewed/Updated: 29 September 1994

TOPIC ----------

AppleTalk Remote Access lets you communicate with another Macintosh or an AppleTalk network over standard telephone lines. For example, you can log on to your Macintosh at work while you're at home.

This document shows you how to install AppleTalk Remote Access and use it with a call-back system (you call the phone number of the AppleTalk Remote Access server, and it calls you back at a predetermined phone number).

DISCUSSION ----------

What You Need

- An internal or external hard drive.
- System software version 7.0 or later.
- File Sharing turned on. See System 7 File Sharing if you need instructions. Dial 1-800-776-2333 and request document number 20217.
- A modem compatible with AppleTalk Remote Access. Refer to the AppleTalk Remote Access User's Guide for a list of compatible modems. Refer to your modem's manual for setup instructions.
- AppleTalk Remote Access software, comes on 800K disks or 1.44MB disks:
  - Two 800K disks titled Installer Disk 1 and Installer Disk 2.
  - One 1.44 MB (high-density or FDHD) disk titled Installer.
- Phone number from which you'll be calling (give this to the server administrator).

- Remote Access document information (from the server administrator):
  - User name
  - Password
  - Phone number of the server.

Turn Off Virus Software

If you use a virus detection program, follow the instructions in the manual to turn it off.

Install AppleTalk Remote Access

1) Insert the Installer 1 (800K disk) or Installer (1.44MB disk) into the main floppy drive.

2) Double-click the disk icon to open it. A window appears.

3) Double-click the Installer icon. The Welcome screen appears.

4) Click the OK button (or press Return). The Installer screen appears.

5) If the name of your hard disk doesn't appear, click the Switch Disk button until it does.

6) Click the Install button (or press Return). If any applications are open on your hard disk, a message appears.

7) Click the Continue button (or press Return). Messages appear to inform you of the installation's progress. If you're using the 800K disk, messages prompt you for the proper disks. When installation finishes, a message appears.

8) Click the Restart button (or press Return).

9) Reactivate your virus detection software.

Configure Remote Access Setup

1) Double-click the Remote Access icon.

2) Choose Remote Access Setup... from the Setup menu. The Remote Access Setup window appears.

3) Click the pop-up menu next to the word Modem.

4) Select the name of your modem. If your modem doesn't appear in the list, it may not be compatible with AppleTalk Remote Access. Refer to the AppleTalk Remote Access User's Guide for more information.

5) If you connected your modem to the Modem Port, skip to the "Create a Connection Document" section.

6) If you connected your modem to the printer port, click the modem port icon to activate the pop-down menu.

7) Select the printer port icon.

Create a Connection Document
---

1) Click the Untitled window to activate it.

2) Type your user name.

3) Type your password (upper case and lower case letters MUST match).

   NOTE: You can save your password by checking the box titled "Save my password." However, this compromises the security of the computer you're calling, and isn't recommended.

4) Type the server's phone number.

5) Choose Save from the File menu. A dialog box appears.

6) Type the name of the connection document.

7) Click the Save button (or press Return).

Connect with AppleTalk Remote Access
---

1) Double-click the Connection document to open it.

2) Type your password. As a security precaution, you won't see it as you're typing -- only dots appear.

3) Click the Connect button. Your modem calls the server's modem. The program compares connection document information to the server's database. If it matches, the server's modem calls you at the predetermined phone number.

4) Select zones and shared volumes from the Chooser. (Your Macintosh at work appears as a server in your zone if you have its file sharing turned on.)

   NOTE: You can quit AppleTalk Remote Access to save memory space while you're connected. Open the application again to disconnect.

5) When you're finished with your session, click the Disconnect button.

6) Choose Quit from the File menu to leave AppleTalk Remote Access.

This article is one of many available through the Apple Fax center. For a complete list of available Fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature).

The Apple Fax center is available free of charge 24 hours a day, 7 days a week.

QuickTime 1.6: Custom Install with CD-ROM Setup 4.0.2 (5/93)

==========

Article Created: 7 May 1993
Article Reviewed/Updated: 16 June 1995

TOPIC ----------

I want to use QuickTime 1.6. When I try to use the "Easy Install" feature of CD-ROM Setup software version 4.0.2., it prompts me for the QuickTime 1.5 diskette. Can you explain?

DISCUSSION ----------

To use QuickTime 1.6 and avoid having the CD-ROM 4.0.2 installer prompt for the QuickTime 1.5 disk, you should:

1) Perform a "Custom" install of CD-ROM Setup 4.0.2 software (which requires only the CD-ROM Setup 4.0.2 disk).

2) Drag the QuickTime 1.6 extension into your Extensions folder.

Font Character Sets: Standards (5/93)

==========

Article Created: 13 May 1993

TOPIC ----------

I need to know which ISO (International Standard Oganization) standard character set Apple uses in System 7.

DISCUSSION ----------

System 7 uses an extended version of the American Standard Code for Information Interchange (ASCII).

Neither the North American English System 7 or 6 character sets are based on an ISO standard. As a matter of fact, when the Macintosh first came out it used a unique character set where the lower 128 characters were defined by ASCII (as was the case with most 8 bit character sets), but the upper 128 characters were mostly defined by Apple. Adobe futher refined the upper characters and with System Software 6.0.4 we first accepted and used the Adobe character sets.

Unicode, a new ISO international industry standard used to encode written characters makes it possible to encode all of the characters used for written languages throughout the world in one table and is the next major step toward providing a multilanguage Macintosh. Apple was one of the founding contributors to the Unicode consortium and is an active participant. Apple plans to provide support for this ISO standard in future releases of system software.

Apple DAT Drive: Use Media Recognition System Tape Cart. (4/97)

==========

Article Created: 14 May 1993
Article Reviewed/Updated: 23 April 1997

TOPIC ----------

I have an Apple DAT drive and wondered what types of tape cartridges I should use. Please advise.

DISCUSSION ----------

The Apple DAT drive, which currently ships in the WorkGroup Server systems, requires the use of MRS (Media Recognition System) Tape Cartridges. These Tapes can be identified not only my the MRS labeling but also by an insignia followed by 4 bars (IIII). The tape should also be DDS-2 rated.

If you are using a different Tape Cartridge and are experiencing write problems, first check the type of Tape Cartridge being used. If the Tape is not an MRS type that is DDS-2 rated, switch to an MRS Tape that is DDS-2 rated. In most cases this should eliminate write problems.

It is important to note that even though the DAT drive will not write to non-MRS Tapes, it will in fact read them. If you have archived information on a non-MRS tape, the drive should be able to read them. However, non-MRS tape should not be used for writing new data.

IMPORTANT: The only tape that is qualified for use in the Apple DAT drive is the MRS Tape Cartridge that is DDS-2 rated.

4D Server: Quadra 800 Cache Problem & Workaround (5/93)

Revised: 5/20/93
Security: Everyone

4D Server: Quadra 800 Cache Problem & Workaround (5/93)

==========

Article Created: 19 May 1993

TOPIC --------------------

I'm setting up a 4D Server 1.0.2 on a Quadra 800 with System 7.1. The 4D Server package does not allow users to connect when the Quadra 800 cache is turned on. The error message is "maximum user count exceeded" when in fact no users are logged on. If cache is turned off, the problem disappears.

DISCUSSION --------------------

Acius Technical Support provides a workaround:

1. Disable the cache and restart the Quadra 800.

2. Start up the 4D Server and proceed through the server's initialization routine.

3. Quit the 4D Server.

4. Turn cache back on and restart the Quadra 800.

5. Start up the 4D Server.

The problem involves the hardware "key" device required by the 4D Server product. The key attaches to the ADB bus and the 4D Server accesses the key to determine the number of authorized users.

For further assistance, contact Acius Technical support directly.

Macintosh: Systems Without System Software Disks (7/93)

==========

Article Created: 14 May 1993
Article Reviewed/Updated: 13 July 1993

TOPIC ----------

I have heard that certain Macintosh models come with system software installed on their hard drives, but have no system software disks in the finished goods box. Please clarify.

DISCUSSION ----------

There are two situations when Macintosh systems don't include system software disks.

1) Modular Macintosh computers (IIvx, IIvi, Centris 610, Centris 650, and the Quadra 800) that are ordered with internal CD-ROM drives. Instead, they get a CD-ROM entitled, "CD Install Me First". This bootable CD-ROM can be used to install System Software and it contains disk images of the System disks so the user can create their own disks. The same Macintosh computers ordered without internal CD-ROM drives still include System Software diskettes in the accessory kit.

2) Macintosh Performa system purchasers are encouraged to immediately do a hard disk backup using the Backup & Restore program that is found on the hard disk. This will insure they have a system backup if there is a problem at a later date.

SNA•ps 5250: Configuring to Multiple AS/400 Computers (2/94)

==========

Article Created: 14 May 1993
Article Reviewed/Updated: 9 February 1994

TOPIC ----------

With SNA•ps 5250 client software is there a way to configure a true passthru so you can connect to two or more different AS/400 computers at the same time? I know that you can have multiple sessions but can they be to multiple AS/400 computers. If so, what needs to be done to configure that?

DISCUSSION ----------

If you have two or more AS/400 computers, you can have sessions to each at the same time using SNA•ps 5250.

First to a short tutorial. If you were using a dumb 5250 terminal and were attached locally (Twinax) to Local400 and wanted to get a session on Remote400, you would request Display Station Passthru (DSPT) to the Remote400. The session on the Local400 would be suspended and a new signon screen presented. A dumb terminal can only do DSPT once! You could not log on to a third AS/400 from Remote400. You would have to return to Local400 and initiate a new DSPT to the third AS/400 (assuming SNA routing, APPN).

Now SNA•ps 5250 does not employ the concept of Local terminal. The connection to the Local400 is done using a DSPT from the SNA•ps 5250 client acting (during the connection time) as an AS/400. Once the connection is made, the SNA•ps 5250 client drops back into dumb terminal mode. These operations are performed in the SNA•ps 5250 Control Panel application. So SNA•ps 5250 has already used its allowed DSPT to get to the local AS/400, and CANNOT request a DSPT to Remote400 using the normal passthru user calls.

Since the SNA•ps Gateway is an APPC LENNODE, it can play in an APPN environment, it just has to be configured completely on all AS/400

computers. It is possible to configure a second Local LU-Remote LU pair on the SNA•ps Gateway which is connected via APPN routing to a second AS/400. This concept is used everyday by users of a third party product over SNA•ps Gateways.

The SNA•ps 5250 product however, cannot do this as simply since the SNA•ps 5250 Control Panel device requires the SNA•ps name for the Local LU to be entered and it applies for all gateway connections. The default name is PASSTHRU. This means SNA•ps 5250 will be able to connect to any and all gateways which have named the SNA•ps name (not the SNA name) of the LU PASSTHRU. If you try to add a second Local LU-Remote LU pair to an existing SNA•ps gateway with a Local LU named PASSTHRU, SNA•ps config objects that a Local LU already exists with that name and will not allow another one.

However it is possible to configure the gateway so that SNA•ps 5250 can connect to a second AS/400 through an APPN connection. Instead of trying to create a second local LU, just do the following:

- Create a 2nd remote LU connected to the already existing local LU. The network name of the remote LU should match the default local location name (usually the same as the system name) of the AS/400 that you want to connect to.

- The mode must exist on the intermediate and the target AS/400.
  What is meant by the intermediate and the target AS/400? The target AS/400 is the actual AS/400 you desire to have a session with. Therefore when the SNA•ps 5250 connection is to be done to the Local AS/400 which has the SNA•ps LEN node attached to it, the target AS/400 is the Local AS/400; or if you want to make a session to another remote AS/400 in the APPN network, the target AS/400 is the remote AS/400 you want a session with. The intermediate AS/400 is any AS/400 (can be more that one) used in APPN routing to get to the target AS/400.

  To illustrate:

  1) Display Station passthru to local AS/400

  2) Display Station passthru to remote AS/400 using APPN routing

  The requirement for the MODE being known is from the IBM APPN routing rules. The Display Station Passthru call carries with it a MODE to be

used. When the DSPT call is to the local AS/400, the MODE has to be known on that computer only. When the DSPT call is to a remote AS/400, you are first setting up an APPC session between the SNA•ps Gateway to the local AS/400 and the MODE used is taken from the DSPT call. The MODE named in the DSPT call has to be defined (known) to the intermediate AS/400. As the DSPT call is APPN routed to the target AS/400, there are additional APPC sessions opened between computers and all along the way the MODE must be defined including the target AS/400.

- If QAUTOCFG is off on the target AS/400, then create a device description for the Macintosh on the target AS/400 - remote LU name is the network name in the PASSTHRU local LU description; attach the device description to the controller description for the intermediate AS/400.

- Vary on the device description on the target AS/400.

That's it - the connection dialog in SNA•ps 5250 will show the two remote LU's (that is intermediate AS/400 & target AS/400). Defining the SNA•ps local LU in the APPN remote location list of the intermediate AS/400 appears not to be necessary for applications like SNA•ps 5250, where the transaction program is initiated from the Macintosh.

A third remote LU can be defined to a third target AS/400. Be sure you have the proper Net ID for the third target (like you needed for the second target above). Then you need to be sure the implemented APPN routing will know how to find the third target and the MODE definition being used by the DSPT call is known to all APPN Nodes along the way.

Another way you could get to two AS/400s from a single SNA•ps APPC gateway is to configure another entire token ring line which makes a direct connection to the target AS/400. The Partner definition would have to be configured but the Local LU can be given a SNA•ps name of PASSTHRU and the Local LU-Remote LU pairs can be configured directly on the remote AS/400. This connection uses the bridging of token ring networks to provide the attachment not APPN. If the connection is via SDLC, then a second Hydra head on the Serial card has to be attached to a second modem to the second AS/400. The MCP cards will probably need a 0.5 Meg RAM upgrade and possibly a 2 Meg upgrade.

Another workaround is to install a second gateway in the same Macintosh as the first gateway or in a separate Macintosh. The second gateway needs another Token Ring card and is free to contact the Local400 but specify a Local LU-Remote LU pair in the Remote400 and use APPN routing to get there. The second gateway can also be setup to attach directly to Remote400 by specifying the token ring address of the Remote400 token ring adapter; token ring bridging provides the connection path.

The only connection limitation of SNA•ps 5250 is connecting to multiple gateways that don't follow a convention in naming the local LU (SNA•ps name) - for example if you have two gateways, one of which calls the local LU "PASSTHRU" and the other "DSPT", you can't use SNA•ps 5250 simultaneously on both gateways. You have to exit SNA•ps 5250 (and SNA•ps Print) and modify the control panel.

System Software Versions 7.0 and 7.0.1: Removing Fonts (9/94)

Revised: 6/5/96
Security: Everyone

System Software Versions 7.0 and 7.0.1: Removing Fonts (9/94)

==========

Article Created: 17 May 1993
Article Reviewed/Updated: 7 September 1994

TOPIC ----------

This document gives instructions for removing fonts from versions of System 7 earlier than 7.1 for the Macintosh computer. System software version 7.1 stores fonts in the Fonts folder within the System Folder.

DISCUSSION ----------

1) Close all open software applications except the Finder. If you try to remove fonts when applications are open, a message appears. Click OK.

2) Double-click the System Folder to open it.

3) Double-click the System file. A window appears, displaying individual fonts installed in the system.

   Note: To group all fonts together in the list, choose by Kind from the View menu.

4) Select the fonts you want to remove, using one of these methods:

   • Selection Rectangle

     a) Press the mouse button when the pointer is in a blank space in the System window, and continue pressing the button while you move the mouse.

     b) You'll see a selection rectangle form as you drag the pointer over the names of the fonts you want to select.

     c) When you release the mouse button, the names of the selected

fonts become highlighted.

- Shift-clicking

  a) While pressing the Shift key, move the pointer over a font you wish to select, and click the mouse button once.

  b) Continue pressing the Shift key and click on each font you want selected.

  c) Release the Shift key.

5) Move the pointer over one of the highlighted fonts, press the mouse button and hold it while you drag the fonts to the Trash.

6) Choose Empty Trash from the Special menu.

cc:Mail On Macintosh and File Level Security (5/93)

Revised: 6/4/93
Security: Everyone

cc:Mail On Macintosh and File Level Security (5/93)

==========

Article Created: 17 May 1993

TOPIC ----------

I'm having a security problem when using cc:Mail in a mixed DOS and Macintosh environment. The server platform is LAN Manager. The problem relates to the lack of file level control under typical AppleShare access.

I believe Macintosh mail users must have access to the cc:Mail directory on a LAN Manager server running as a post office. This allows access to all files if they mount the directory as an AppleShare volume. MS-DOS users are locked out of the other mail files because security is at the file level.

Could you confirm this?

DISCUSSION ----------

cc:Mail Technical Support told us that though they mount the whole AppleShare volume, the administrator can impose security from LAN Manager so the users won't have more access than they should. The two requirements are the cc data directory has to be Read, and Write and Shareable, while the cc:Mail directory is Readable. Other directories on the volume can be set to not accessible by the users.

If you are still not sure on how to do this, contact cc:Mail Tech Support directly. To locate a vendor's address and phone number, use the vendor name as a search string.

LaserWriter: Checking Hard Drive Capacity (8/95)

Revised: 8/23/95
Security: Everyone

LaserWriter: Checking Hard Drive Capacity (8/95)

==========

Article Created: 19 May 1993
Article Reviewed/Updated: 22 August 1995

TOPIC ----------

How can I check the capacity of a SCSI hard drive attached to an Apple Laserwriter printer?

Can I use the Apple LaserWriter Utility 7.4 to do this?

DISCUSSION ----------

There are two ways to check the capacity of a SCSI hard drive attached to a hard-drive compatible Apple LaserWriter:

- Use a PostScript program (listed at the end of this article) to check the hard drive's capacity. This works with any hard-drive compatible LaserWriter.

- Connect the hard drive to a Macintosh. This only works if your hard drive is formatted in Macintosh-compatible format, as with the LaserWriter IIf, IIg, and the LaserWriter Pro 630.

Unfortunately, there is no option to check the capacity of any Laserwriter printer's hard drive in any version of Apple's LaserWriter Utility. The LaserWriter IINTX, LaserWriter IIf and IIg, and the LaserWriter Pro 630 are all hard-drive compatible, but they use different types of hard disk formatting.

The LaserWriter IINTX uses the LaserWriter Font Utility to initialize attached SCSI hard disk drive(s) as one logical disk device for the PostScript file system. The LaserWriter IINTX regards all attached hard drives as a single logical unit, therefore these drives are not recognized by the Macintosh file system.

The LaserWriter IIf and IIg, and the LaserWriter Pro 630 use the LaserWriter Utility to initialize attached SCSI hard drives. This utility initializes the

hard drive in a Macintosh compatible (HFS) format and supports the PostScript file system.

Here is a simple PostScript program that displays the total and free space available on a LaserWriter's hard drive:

```
/Helvetica findfont 14 scalefont setfont
statusdict begin
30 100 moveto
(A page is 1024 bytes.) show
30 115 moveto
(The total number of pages are) show
diskstatus
10 string cvs show
30 130 moveto
(The number of free pages are) show
10 string cvs show
showpage
```

Cut and paste these 12 lines of code to TeachText and download the file with the appropriate utility.

WARNING:
If you choose to use the PostScript code provided in this article, you assume all risks involved in making these changes. PostScript code, if not entered correctly, can place the LaserWriter into a condition requiring service.

Article Change History:
23 Aug 1995 - Made minor corrections.
08 Feb 1995 - Made minor technical updates; added PostScript warning.
11 Jan 1995 - Added keyword and made several technical updates.

LaserWriter Driver 7.2 and Earlier: New York and Geneva Fonts

Revised: 5/19/93
Security: Everyone

LaserWriter Driver 7.2 and Earlier: New York and Geneva Fonts

==========

Article Created: 18 May 1993

TOPIC ----------

There's a known problem with LaserWriter driver versions 7.2 and earlier when used with New York and Geneva fonts and Font Substitution turned ON. The printed underline is about a centimeter short of the full line of text.

DISCUSSION ----------

These LaserWriter driver versions calculate the font metrics incorrectly when Helvetica and Times are automatically substituted for Geneva and New York, with Font Substitution ON. These driver versions measure the underline using the Geneva and New York FONDs, instead of the Helvetica and Times FONDs. Turn Font Substitution OFF when using these LaserWriter driver versions. The best solution is to use LaserWriter driver version 8.0.

LaserWriter Pro 600: PostScript Error Printing Legal Size 5/93

Revised: 5/19/93
Security: Everyone

LaserWriter Pro 600: PostScript Error Printing Legal Size 5/93

==========

Article Created: 18 May 1993

TOPIC ----------

I'm having a problem printing to my LaserWriter Pro 600. I'm getting: "%%[ERROR:CONFIGUATIONERROR; OFFENDINGCOMMAND: SETPAGEDEVICE; ERROR INFO: PAGESIZE--NOSTRINGVAL --]%%" message while trying to print a Legal size document from the multipurpose tray.

I'm using the Apple PPD (PostScript Printer Description, V2010.130 8), a Quadra 700, and PageMaker 4.2a.

DISCUSSION ----------

To resolve this issue, set the multipurpose tray for Legal size paper via the LaserWriter Utility and choose "Paper Handling" in the "Utilities" menu.

The PostScript error: "%%[ERROR:CONFIGUATIONERROR; OFFENDINGCOMMAND: SETPAGEDEVICE; ERROR INFO:PAGESIZE--NOSTRINGVAL --]%%" is due to a discrepancy between what paper size is selected in the Print dialog as opposed to what paper sizes are currently available at the printer. In other words, if the customer has "Legal" selected in the Print dialog and the printer DOES NOT have a Legal size paper tray installed, or DOES NOT have the multipurpose tray set for Legal size paper, then the error will occur.

Macintosh LC III: Monitors Supported at 640 x 400 Pixels (5/93)

Revised: 5/24/93
Security: Everyone

Macintosh LC III: Monitors Supported at 640 x 400 Pixels (5/93)

==========

Article Created: 18 May 1993

TOPIC ----------

Which monitors does the Macintosh LC III support at 640 by 400 pixels?

DISCUSSION ----------

The Macintosh LC III can support the Apple 12-inch Monochrome Monitor, Macintosh 13-inch High-Resolution Monitor, and Macintosh 14-inch Color Display at 640 by 400 pixel resolution as well as at the standard 640 by 480 pixel resolution.

Here's how to select 640 by 400 pixel resolution:

1) Open the Control Panel and choose the Monitors option.
2) Hold down the Option key on the keyboard and choose the "Options..." selection in the Monitors dialog box.
3) 640 by 400 will appear as one of the choices under the Select Monitor Type dialog box. Choose 640 by 400 and click OK.

Your screen will now be set to 640 by 400 pixels resolution. To deselect this option, follow the same steps and choose a different option in the Select Monitor Type dialog box.

This information is also provided in the Getting Started manual for the Macintosh LC III.

KanjiTalk: Compatible with WorldScript (5/93)

Revised: 5/19/93
Security: Everyone

KanjiTalk: Compatible with WorldScript (5/93)

==========

Article Created: 19 May 1993

TOPIC --

I have a Macintosh with System 6.0.7 and KanjiTalk. Can I exchange documents with a Macintosh running 7.1 and using the Japanese Language Kit (WorldScript)?

DISCUSSION --

There's no problem sharing documents between KanjiTalk systems (such as KanjiTalk system 6.0.7) and the Japanese Language Kit. The only requirement is to use KanjiTalk 7 compatible applications, since this helps ensure compatibility with the Japanese Language Kit. There's a list of localized applications tested with the Japanese Language Kit; it's included in the article "Japanese Language Kit: Overview (4/93)" in the Tech Info Library.

The other key factors are that both Macintosh computers have the same fonts installed and use the same applications. In the case of the KanjiTalk 6.0.7 system, the TrueType INIT is required when using a Kanji TrueType font. As in the US operating system, if different applications and/or fonts are used on the two Macintosh computers, there's the potential for incorrect document formatting and/or character mapping, respectively. Depending on the document contents and format, the specific application that created the document may be required to open it; however, generic files, such as text files, shouldn't have this problem.

Security: Everyone

At Ease 1.1: "Gather Applications" Address Error (8/95)

==========

Article Created: 19 May 1993
Article Reviewed/Updated: 08 August 1995

TOPIC ----------

With At Ease 1.1 installed on a Macintosh Classic running system software version 7.1, selecting "Gather applications" gives an address error. This has only been observed on 68000 CPUs such as the Macintosh Plus, SE, and Classic. If you have At Ease 1.1, and are experiencing this problem, obtain version 1.0.

DISCUSSION ----------

The good news is, At Ease 1.0 does not have this problem. We removed At Ease 1.1, installed At Ease 1.0, and again selected "Gather applications," this time with no problems.

The primary change in At Ease 1.1 was to sort the At Ease items correctly for international users. It's likely that this change caused this problem. If you're using an English system, At Ease 1.0 should work just as well as At Ease 1.1 for you.

Security: Everyone

Custom Icon: Limited to 34 Colors (5/93)

==========

Article Created: 20 May 1993

TOPIC ----------

When I copy certain colors created in Canvas to custom icons, not all of the colors are copied (particularly, green). The green color created in Canvas appears as white when presented in an icon. I didn't use ResEdit in this sequence.

DISCUSSION ----------

If you use ResEdit, you'll see that only 34 colors are available for icon resources. These colors aren't customizable, they are strictly defined. If you use a custom color (not in the palette of 34 icon colors) while in a graphics program, the system attempts to map the custom color to the icon palette color when you make the image into an icon.

There are specific shades of greens, browns, blues, purples, and grays available. Black, white, yellow, and red are also available. To get predictable results, use the colors from ResEdit's Icon editor when working in Canvas; or use ResEdit's Icon editor.

The 34 colors of the icon color palette are in the following positions on the standard 256 color System palette. The column/row format used matches the ResEdit icon editor's color selector format.

1	8	51	22	146	227	159	165	72	192	236	176	42	84	127	171
19	105	92	0	245	246	43	247	248	249	250	251	252	253	254	255
5	216														

For another way to match colors, follow these steps:

1) Open ResEdit.
2) Open the Icon editor from an icl8 resource.

3) Drag the tear-off color selector onto the desktop.
4) Take a picture of the screen (shift-command-3).
5) In your graphics program:
   a) Open the screen picture file (named Picture 1, or other number).
   b) Use the eyedropper tool to pick up the colors in the color selector.

The 34 colors of the icon color palette can't map directly to the 16 colors in the 16-color System palette. Of the 34 colors not available in the 16-color palette, most are mapped to a gray, white, black or an associated color.

LaserWriter IIg: Increase Printing Speed From Photoshop (5/93)

==========

Article Created: 20 May 1993

TOPIC ----------

I have a LaserWriter IIg printer with 8MB of RAM connected to a Macintosh Quadra. When printing from Photoshop, some of the print jobs take 10-20 minutes.

What kind of increase in speed can I expect by adding more memory?

DISCUSSION ----------

Complex documents may take 10-20 minutes to print. Increasing the printer's memory will probably have little effect on performance.

I would like to offer a couple of suggestions:

1) Let Photoshop do the grayscale conversion. If the user is working with a RGB (default mode), covert the photo to grayscale and save the modified image to another file. Then, print the modified grayscale file.
   By allowing Photoshop to do the conversion, you eliminate the need for the printer driver (QuickDraw) to convert the color image to grayscale.

2) In the LaserWriter Utility, under "Imaging Options", try experimenting with the frequency/angle slider. The lower the frequency, the faster the processing. However, you give up some resolution.

LaserWriter Driver 8.x: Tray Switching Option (2/96)

==========

Article Created: 20 May 1993
Article Reviewed/Updated: 23 February 1996

TOPIC ----------

I'm using the LaserWriter 8.x driver. When I choose "Print" from the File menu, a Print Options Dialog box appears. I get several choices, such as FinePrint, PhotoGrade and, TraySwitch. Can you explain "TraySwitch"?

DISCUSSION ----------

The "TraySwitch" option allows the printer to automatically switch to the other paper trays when the current tray runs out of paper. Thus, between the 250-sheet paper cassette and the 100-sheet multipurpose tray of a LaserWriter Pro, you can print 350 sheets without having to reload paper.

Here are the settings you can select from the TraySwitch pop-up menu:

TraySwitch: Printer's Default
- does not change the current setting in the printer.
TraySwitch: True
- enables trayswitching
TraySwitch: False
- disables trayswitching

By the way, this option is only available if the printer you are using supports it.

Quark XPress: Slower Launch Under System 7.1 (3/95)

Revised: 3/7/95
Security: Everyone

Quark XPress: Slower Launch Under System 7.1 (3/95)

==========

Article Created: 19 May 1993
Article Reviewed/Updated: 7 March 1995

TOPIC ----------

After installing System 7.1, it takes a lot longer to open Quark XPress than it used to under my previous system software.

DISCUSSION ----------

The problem you are experiencing has to do with the way Quark XPress handles the new Fonts folder that came into existence with System 7.1. The only solution is to upgrade your version of Quark XPress to 3.2 or higher.

With Quark XPress version 3.1, the more fonts you have, the longer it will take to open the application. It does not matter how you install the fonts in the Fonts folder in the System Folder (that is, they can be loose in the Fonts folder, in suitcases in the Fonts folder, or you could organize them using Suitcase 2.1.2 or Master Juggler).

This problem would only be noticed by a user who is running a version of Quark XPress prior to 3.2, who has upgraded from System 6.0.x, 7.0, or 7.0.1 to System 7.1 or later.

The slow launch of Quark XPress is a known issue which was fixed by Quark Express version 3.2. The current version is of Quark XPress is 3.3.1. You will need contact Quark for help with this issue.

This issue may also exist in other desktop publishing software like TypeStyler by Broderbund.

This article provides information about non-Apple products. Apple Computer, Inc. is not responsible for its content. Please contact the vendors, Quark and Broderbund, for additional information.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

Article Change History:
07 Mar 1995 - Added more detailed information about why Quark launches more slowly under System 7.1.
02 Feb 1995 - Changed access privileges of article.

LaserWriter Driver 8.0: Overview (5/93)

Revised: 5/20/93
Security: Everyone

LaserWriter Driver 8.0: Overview (5/93)

==========

Article Created: 20 May 1993

TOPIC ----------

This article describes the LaserWriter printer driver, version 8.0.

DISCUSSION ----------

The Apple LaserWriter printer driver, version 8.0, improves the functionality and performance of PostScript-compatible LaserWriter printers, especially those capable of supporting PostScript Level 2.

The driver software combines all of the features of previous LaserWriter printer drivers, including application compatibility, support for TrueType fonts and PostScript Level 1 compatibility, and it adds support for features that are specific to individual printers. Specific PostScript Printer Description files (PPDs) offer finger-tip control for printer features such as multiple paper trays, printer resolution, PhotoGrade and optional envelope trays. This means that a printer with two or more paper trays can easily and efficiently print page one of a document on letterhead and the rest of the document on regular bond paper.

The new driver is designed to improve background printing performance, up to 30% for business graphics. It also provides support for PostScript Level 2 features, including data compression, real-time error reporting, patterns and pattern caching and color.

AVAILABILITY
The LaserWriter printer, version 8.0 is expected to begin shipping the first week in June. It is currently available on AppleLink in both the 800K and the 1.44MB versions under the following path: Apple Products -> Apple Software Updates -> Macintosh -> Printer SW -> LaserWriter 8.0.

The driver was co-developed by Apple Computer, Inc. and Adobe Systems Inc.

Adobe will ship the driver separately under the brand name of PSPrinter version 8.0.

Macintosh: Using Without a Monitor (5/93)

==========

Article Created: 20 May 1993

TOPIC ----------

This article gives information about what you need to run a Macintosh without a monitor (headless).

DISCUSSION ----------

Remove any screen saver (such as After Dark). When the Macintosh starts up, the screen saver checks to see what kind of monitor is attached so it can size its modules accordingly. If there's no monitor attached, it keeps looking or crashes.

To make a headless server work on a Quadra running System 7.0.1, you need to install Virtual Monitor Switch from Apple. Engineering has confirmed that the Virtual Monitor control panel is only needed when running system software version 7.0.1 on Quadra 700, 900, or 950 systems without a monitor.

System software version 7.1 doesn't require Virtual Monitor Switch.

NEC CD ROM: FFA Version Required (6/93)

==========

Article Created: 4 June 1993

TOPIC ----------

To use the NEC CD ROM with a Macintosh, you must install Foreign File Access 4.0.2 or later versions.

DISCUSSION ----------

You can find Foreign File Access on AppleLink posted in Software Updates, or you can obtain it from the vendor directly.

Also, Apple Software Licensing gave NEC and other CD-ROM distributors permission to distribute CD-ROM Setup 4.0.2.

Printer Control Language: HP PCL 4 and 4+ Differences (5/93)

Revised: 5/21/93
Security: Everyone

Printer Control Language: HP PCL 4 and 4+ Differences (5/93)

==========

Article Created: 21 May 1993

TOPIC ----------

What is the difference between HP PCL (Printer Control Language) 4 and 4+ ?

DISCUSSION----------

Hewlett Packard's explanation for the 4+ version was that it's possibly related to added features of the LaserJet IIP printer. The added capabilities include things such as different raster compression modes and the ability to rotate fonts. These features are specific to the HP LaserJet IIP firmware, and are NOT available as part of the generic PCL 4 language. Thus, you can think of PCL 4+ as a superset of PCL 4.

LocalTalk RJ-11 Connector: Description (5/93)

Revised: 5/21/93
Security: Everyone

LocalTalk RJ-11 Connector: Description (5/93)

==========

Article Created: 21 May 1993

TOPIC ----------

This article describes the Apple LocalTalk RJ-11 Connector.

DISCUSSION ----------

The Apple LocalTalk RJ-11 Connector system provides a flexible solution for sharing information, printers and communicating with others over common, unshielded, twisted-pair cabling. Using Apple LocalTalk RJ-11 connectors allows you to build affordable, easy-to-use, easy-to-expand, AppleTalk networks on unshielded, twisted-pair cabling for fast, reliable network communications.

Features

- Connects to Macintoshes with mini DIN-8 or DB-9 connector
- Connects to any network Apple printer
- Uses unshielded, twisted-pair cabling
- Upward migration from simple bus to star-topology with a central hub
- High-speed using built-in LocalTalk found on every Macintosh
- Easy installation

Benefits

- Allows any Macintosh to utilize economical, twisted-pair cabling for LocalTalk communications

- Allows any Macintosh to utilize common, industry-standard, twisted-pair wiring often already found pre-installed in buildings.

- Start with small networks using bus-topology then by adding

additional connectors, create managed networks using star-topology with a central hub available from third parties.

- Easy setup and administration. Installs in minutes.

- Offers 230.4 kilobits per second for network transmission and reception.

Product Details

The AppleTalk network system found in every Macintosh computer allows you to share information, printers and other network devices and easily communicate with others.

Using the Apple LocalTalk RJ-11 Connector system provides an affordable, easy-to-build, easy-to-expand means to create AppleTalk networks over common, unshielded, twisted-pair cabling.

LocalTalk RJ-11 Cabling Specification

- Unshielded twisted-pair cable type: silver satin or phone cable
- Maximum network distance is 550 meters (1800 feet)
- Maximum number of devices per network = 24
- Termination of network required at each end (terminators supplied)
- Compatible with third-party, twisted-pair communications including PhoneNET from Farallon.

System Requirements

Any Macintosh computer with 1MB of RAM or greater on any Apple network printer with one of the following LocalTalk RJ-11 connectors:

- Circular mini DIN-8 connector for use with all Apple CPUs and printers that require them or
- DB-9 connector for use with Macintosh CPUs and network printers that require them (see below).

Technical Specifications

Connector:

- Circular mini DIN-8 connector for use with all Apple CPUs and printers except those listed below
- DB-9 connector for use with Macintosh 128K, 512K, 512Ke, LaserWriter and LaserWriter Plus
- Two RJ-11 connectors for network cable interface

Certification:

- FCC Class A tested
- No other agency approvals required

Software:

- AppleTalk (built-in with System Software); no additional software

required

Environmental requirements:
- Operating temperature: 32° to 131°F (0° to 55°C)
- Humidity: 0% to 90% noncondensing

Ordering Information:

LocalTalk RJ-11 Connector Kit DIN-8: Order No. M1657Z/A

LocalTalk RJ-11 Connector Kit DB-9: Order No. M1661Z/A

With your order, you receive:
- LocalTalk RJ-11 Connector
- 2m unshielded twisted-pair
- One terminating resistor
- Configuration Guide
- One year world-wide limited warranty

QuickTime 1.6: Upgrade and Description (9/95)

==========

Article Created: 7 May 1993
Article Reviewed/Updated: 7 September 1995

TOPIC----------

This article describes QuickTime 1.6.

DISCUSSION ----------

QuickTime 1.6 Features

- Significantly improved performance, sound and graphics support.

- Movies will play back more than 10 percent faster than the previous version 1.5, delivering smoother playback.

- The new sound manager provides customers using third-party sound cards with the ability to input and play back CD-quality, 16-bit sound from QuickTime movies. The new Sound Manager (version 3.0) completely replaces the existing Sound Manager, and it will work with all versions of QuickTime. If Sound Manager 3.0 is installed, QuickTime 1.6 will take advantage of its new features.

- A Movie Import component is provided which allows you to open Audio CD tracks from QuickTime’s Standard File Preview dialog, just as you could open PICS and AIFF files with QuickTime 1.5. If you have an AppleCD 300 or CD 300i drive, you can use QuickTime 1.6 to convert tracks of your favorite audio CD directly into QuickTime movies.

- By supporting ColorSync, Apple's color-matching technology, QuickTime 1.6 will ensure that colors in a movie played on one color monitor will be the same when played on any other color monitor.

- QuickTime 1.6 requires 90 percent less memory than the previous version when installed, giving Macintosh customers with entry-level machines more flexibility when installing QuickTime.

QuickTime 1.6 is available in the System 7.1 upgrade and update kits, through Apple directly, and via a variety of bulletin boards and users groups. The extension is also included as part of the QuickTime Developer Kit available from APDA, Apple's source for developer tools.

Article Change History:
07 Sep 1995 - Made minor changes.
09 Aug 1993 - Added more detail about improvements to sound.

System Software Extensions: How They Work (5/93)

Revised: 5/21/93
Security: Everyone

System Software Extensions: How They Work (5/93)

==========

Article Created: 21 May 1993

TOPIC ----------

This article explains how system extensions (formerly called INITs), function and sometimes cause problems.

DISCUSSION ----------

The Trap Dispatch Table

The Macintosh operating system incorporates a feature that allows updating and modifying incrementally, via the Trap Dispatch Table. The Trap Dispatch Table contains the addresses of all the Tool Box routines in the ROMs that actually make the Macintosh work. When a program uses the Tool Box, it drops the address of the trap (listed in the Trap Dispatch Table) into the processor, and this activates the trap.

A programmer changes the system software by editing the Trap Dispatch Table (a process called patching) so that the call goes not to the ROMs, but to a piece of code somewhere in the system heap. A programmer can alter any part of the Tool Box's normal behavior using this method.

Example: The Oscar the Grouch extension patches the normal Empty Trash Traps with one that says, "When empty trash is chosen display this graphic and play this sound," then it calls the normal empty trash traps.

How Extensions Cause Problems

- Old extensions
  Old extensions cause problems because the information they receive or return is out of date. For example, under an older system, the unaltered trap returned "Frank" and the extension was programmed to return "Frank." But under the newer system the trap returns "Fred."

When the extension still returns "Frank," every piece of code expecting "Fred" will have problems. Likewise, if the system returns "Fred" and the extension is still expecting "Frank" the extension itself will crash.

- Coding Issues
  Sometimes an extension has bugs, and crashes whenever it encounters a certain set of circumstances. The circumstances can be very rare or bizarre. Coding errors are a particular problem with shareware.

- Extension Conflicts with other Extensions
  Sometimes two extensions try to patch the same trap. A surprising number of extensions can do this and get away with it. When they don't they cause a crash.

Turn Off Extensions When Troubleshooting

The thing to remember when troubleshooting is that extensions effectively REWRITE THE SYSTEM SOFTWARE. When code makes calls, the Finder and even other extensions don't behave in the same way as they do in the unaltered system.

If you troubleshoot with extensions ON, be aware that the system's behavior may be close to random. Nothing may work as you expect it to. You can't determine with any certainty whether hardware, system software, or an application failure causes the problem as long as extensions are running. So TURN OFF EXTENSIONS at the start of any troubleshooting where it is at all feasible. In cases where it isn't, try to remove or disable all extensions you can.

DAL, Duo 230 With Express Modem, and Protocol Converter 8/93

Revised: 7/7/94
Security: Everyone

DAL, Duo 230 With Express Modem, and Protocol Converter 8/93

==========

Article Created: 21 May 1993
Article Reviewed/Updated: 31 August 1993

TOPIC ----------

I'm having trouble with a protocol converter access to DAL when using a PowerBook Duo 230.

If I make a protocol converter connection from a desktop Macintosh with modem attached, everything works properly. However, I'm not able to get either a PowerBook Duo 230 with an Express Modem, or the Duo in a Duo Dock with an external modem to work.

DISCUSSION ----------

We have done extensive testing and have the answer for you:

1) The Duo cannot be docked if the internal (Express) modem is being used to access a Protocol Converter (pcrv). There was no way that I was able to get DAL to even be able to take that modem "off-hook" when the Duo was docked.

   If the desired access is to a VAX, then the AsyncCTB (CommToolBox) network adapter can be used successfully with a docked Duo and the Express modem.

2) With the Duo docked it is possible to use another, external modem. I used both the Apple Personal (300/1200) modem and a Hayes Optima 96 modem. For this configuration:
   • The Control Panel document for the "EXPRESS MODEM" must be turned OFF

3) With the Duo undocked, you CAN use the internal modem:
   • The Control Panel for the "EXPRESS MODEM" must be ON
   • The Control Panel for the "POWERBOOK" must be set to INTERNAL

Because the Express Modem is more sophisticated than DAL is prepared to handle,

you MUST tell DAL that you are not using a modem and instead send the correct modem strings to reset, dial and hang-up in the DAL connection script. (See sample script below.)

The following is a connection script that has been successfully tested (repeatedly) with the internal Express Modem in a PowerBook Duo 230. The modem strings for this script were originally written for the Hayes Optima 96 and were successful with the Express Modem, so I think that they should work for anyone using the internal Express Modem. (Different external modems may require changes to the modem strings.)

```
rem:: This is a script for a Duo 230/210 with the Express Modem
rem:: The Duo CANNOT be docked !!
rem:: The Control Panel document for the "POWERBOOK" must be set to
rem::    INTERNAL
rem:: The baud rate in the script cannot be set to more than 9600 --
rem::    regardless of the modem's actual max speed supported by other
rem::    apps
rem:: You have to tell DAL it is NOT using a modem.
rem:: The script must send the correct modem strings for your modem.
rem::    This is because the modem in the PowerBook Duo is too advanced for
rem::    DAL's usual approach to a modem.
rem:: The modem strings in this script were for using a Hayes Optima 96 and
rem::    worked with the internal modem in the PowerBook Duo.

duck:pcrv:TSO:7171:com1:9600:No:8data:1stop:Both:128:NoModem:T:9,5551212:
32:1
duck:login:1:\mREADY\slogoff\r\mlogon\w2\s+++\w2\sATZ\r\mOK\sATH0\r:2000:
4000::\sATZ\r\mOK\sAT&FL1 W1 &K0 &W0\r\w2:\sATDT9,5551212\r\w45\mCONNECT
\w2\r\mTYPE\svt100\r\mlogon\stso \u\r\mPassword\p\r\mREADY\x600
```

••• Note: this sample script may contain extra carriage returns if you paste it out of AppleLink into your DAL Preferences file. Please be sure to check that there are only two (2) carriage returns. 1 at the end of each portion that begins with "duck:". (These two are required.) If there is a carriage return "within" the login definition portion (the 2nd "duck:"), the DAL client will think that the connection script is terminated at that point, and will try to send the server launch command. Since it is not truly at the end of the connection script, the connection attempt would fail. So, be sure there are no carriage returns between the 2nd "duck:" and "\x600". •••

The parameter "NoModem" on the first line of the script is what keys the DAL Client to not try to control the modem itself. The phone number information on the first line is just an FYI, the actual phone number used is the one in the ATDT string in the second portion of the connection script.

We think that this script should work for you. However, you will have to change the protocol converter type (7171 in this script) to the name of the file you usually use!

Article Change History:
31 Aug 1993 - Included Note regarding script and extra carriage returns.

LaserWriter Pro 630 Windows Software: No Standalone DOS Support

Revised: 5/24/93
Security: Everyone

LaserWriter Pro 630 Windows Software: No Standalone DOS Support

==========

Article Created: 25 May 1993

TOPIC ----------

Do the Windows drivers that ship with the LaserWriter Pro 630 support DOS (versions 3.0 and 5.0) machines using Word Perfect version 5.0?

DISCUSSION ----------

The Windows software that ships with the LaserWriter Pro does not support the standalone DOS environment. Apple ships the printer files which inform the Windows PostScript driver of the LaserWriter Pro capabilities. That is, tray options, imageable area, and others.

Apple doesn't ship the Windows PostScript driver. The Windows PostScript driver is automatically included when customers purchase MicroSoft Windows.

Word Perfect Corporation provides printer drivers that work with their applications. To locate a vendor's address and phone number, use the vendor's name as a search string.

StyleWriter II: How to Enable or Disable PrinterShare (5/93)

Revised: 5/25/93
Security: Everyone

StyleWriter II: How to Enable or Disable PrinterShare (5/93)

==========

Article Created: 7 May 1993

TOPIC ----------

This article describes how to enable and disable PrinterShare on the StyleWriter II.

DISCUSSION ----------

To enable PrinterShare:

1) Choose the Chooser from the Apple menu.
2) Activate AppleTalk
3) Select the StyleWriter II printer by clicking on StyleWriter II icon.
4) Click Setup, and "Share This Printer" will now appear to be selected with a check in the checkbox.
5) Close the Chooser
6) Restart your computer

To disable PrinterShare:

1) Choose the Chooser from the Apple menu.
2) Activate AppleTalk
3) Select the StyleWriter II printer by clicking on StyleWriter II icon.
4) Click Setup, and "Share This Printer" will now appear to be selected with a check in the checkbox.
5) Click in the checkbox to deselect "Share This Printer".
6) Deactivate AppleTalk
7) Restart your computer

In other words, AppleTalk must be ACTIVE in order to disable the sharing checkbox.

DeskWriter and System 7.1: Font Placement (5/93)

Revised: 5/25/93
Security: Everyone

DeskWriter and System 7.1: Font Placement (5/93)

==========

Article Created: 25 May 1993

TOPIC ----------

Where do I place my DeskWriter fonts in System 7.1?

DISCUSSION ----------

According to Hewlett Packard (HP), the DeskWriter fonts which include CS Courier, CS Symbol, CS Times, and CS Triumvirate reside in a folder named "DeskWriter Fonts" at the root level of the System folder, not in the Fonts folder. This applies to HP driver versions prior to 3.1.

Versions 3.1 or latter of the HP software will create a folder named "HP Folder" or "HP Fonts Folder" that resides in the Preferences folder under System 7.x.

HP users can also remove their HP fonts entirely and use the TrueType fonts that are built into System 7. To use TrueType fonts or Adobe Type Manager fonts, change the DeskWriter driver Page Setup options as follows:

Version 2.2: Turn off "Font Substitution" and "Use High-Quality Printer Fonts".
Version 3.1 or latter: Turn off "Font Substitution" and "Use HP Fonts", then select "Save as Default".

Quadra 900, 950: Problem with RAM Disk and 256MB RAM (3/94)

Revised: 3/9/94
Security: Everyone

Quadra 900, 950: Problem with RAM Disk and 256MB RAM (3/94)

==========

Article Created: 24 May 1993
Article Reviewed/Updated: 9 March 1994

TOPIC ----------

A Quadra 950 with 256MB of RAM will not let me use a RAM Disk. A clean install of software didn't help. The computer has no other hardware connected. With the RAM disk turned on, the computer locks up at startup. It will only start up if all extensions are turned off by holding down the shift key. Under System 7.0.1, using the shift key at startup will disable the RAM disk feature. Thus allowing you to boot the machine. Under System 7.1, using the shift key at startup will NOT disable the RAM disk feature. Using either version of System Software, you can turn the RAM disk off by zapping PRAM (hold down the command–option-P-R keys while restarting).

DISCUSSION ----------

The problem exists only when you install 256MB of RAM in a Quadra 900 or 950 and try to turn the RAM disk on. With less than 256MB of RAM, everything will work fine. The maximum RAM size that the built-in RAM disk will work with is 224MB, using twelve 16MB SIMMs and four 8MB SIMMs. The MMU page table was limited to 256K, and when the machine is loaded with 256MB of RAM, it grows a little too much, and overwrites the RAM disk portion of memory. Therefore, if they were to take out four of the 16MB SIMMs, it would work correctly.

Apple does not support 16MB SIMMs in a Quadra, although in most situations they work fine. (Apple does support 16MB SIMMs on the Macintosh IIvx, the Performa 600, and the newer Macintosh systems that use 32-bit SIMMs.)

Third-party solutions such as Maxima from Connectix work with 256MB RAM on the Macintosh Quadra 900 and 950. They also have more features than the built-in RAM disk.

Article Change History:
9 March 1994 - Added information on turning Extensions off under System 7.1

Sound File, CDev: Shouldn't Be Opened Together (5/93)

Revised: 5/26/93
Security: Everyone

Sound File, CDev: Shouldn't Be Opened Together (5/93)

==========

Article Created: 26 May 1993

TOPIC ----------

When I perform the following steps, my Macintosh no longer responds.
Why is this?

1) Put a sound file into the Control Panels folder.
2) Select the sound file and a Control Panel.
3) Open both files at the same time (CMD-O, or double click)

DISCUSSION ----------

This is a known reproducible situation. It isn't clear why these steps are required for operation of the Macintosh. The recommendation is to NOT perform these steps.

To prevent this from happening inadvertently, place any sounds that you need in the Control Panels folder inside another folder. Items in different folders can't be selected and opened together.

At Ease 1.0: Shift Down Restart (8/95)

==========

Article Created: 21 May 1993
Article Reviewed/Updated: 08 August 1995

TOPIC -----

What happens with At Ease when I start up with the Shift key down?

DISCUSSION -----

At Ease always loads, but if there's no password or the proper password is entered, At Ease quits and the Finder loads. In the Finder, At Ease won't be available under the Application menu. Here's the startup sequence with the Shift key down:

1) System software loads.
2) Extensions don't load.
3) At Ease loads.
4) At Ease checks for a password and asks for the password if one is installed.
5) At Ease quits.
6) Finder loads.

If you click the Cancel button when At Ease asks for the password, At Ease loads as normal and displays its menus and panels. You still find the password enabled if you go to the Finder. From the Finder, At Ease is available under the Application menu.

Japanese Font in Finder: Created Folders Use Kotoeri (5/93)

Revised: 5/28/93
Security: Everyone

Japanese Font in Finder: Created Folders Use Kotoeri (5/93)

==========

Article Created: 27 May 1993

TOPIC ----------

Whenever the Finder font is set to a Japanese font, the system always jumps into Kotoeri when changing a file or folder name in the Finder. Is there a way to turn this feature off?

DISCUSSION ----------

In the manual, Apple recommends setting the Views to a Japanese font so that folders will have names properly displayed (not names with garbage characters). Thereafter, when you create folders it makes sense for the Finder to "jump into Kotoeri" since you have a Japanese font selected.

You could select a Roman font from Views, but then you have the "garbage" characters' problem. A more elegant solution is to click on the Roman font option from the Operations Pallet (upper right corner option -- the "A with a down arrow"). To select this option you could also use two short cuts:

- Press "shift option tab" to rotate through the Operations Pallet options, or

- Press "option shift-d"

MacX: XDM-CP Support (6/93)

Revised: 6/16/93
Security: Everyone

MacX: XDM-CP Support (6/93)

==========

Article Created: 9 June 1993

TOPIC ----------

We have an HP X Windows-based information system and X terminals supplied by HP. I would like to access the system from a Macintosh using MacX.

I have demonstrated XWindows connectivity by launching an XTerm window. I connected to HPVue for some of the applications running on the client. However, there is a login window that the X terminal gets from using the XDM-cp. This application launches all the appropriate applications that are set up for a specific user.

What's the best way to approach my XDM problem?

DISCUSSION ----------

The key is to set an entry for a foreign server in your xdm comfiguration files. The xdm daemon will then look for those displays to become available, and, when they do, the daemon will manage them.

If you're using xdm, the file xdm-config (usually located in /usr/lib/X11/xdm) contains an entry for the file containing the name of the server it is supposed to manage. This line looks something like

DisplayManager.servers: /usr/lib/X11/xdm/Xservers

This file contains an entry for each server to manage and looks like:

```
#
# Xservers file, workstation prototype
#
# This file should contain an entry to start the server on the
# local display; if you have more than one display (not screen),
```

```
# you can add entries to the list (one per line).  If you also
# have some X terminals connected which do not support XDMCP,
# you can add them here as well.  Each X terminal line should
# look like:
#       XTerminalName:0 foreign
#
# :0 local /usr/bin/X11/XmacII :0 -v -logo
mac_name:0 foreign
```

Here, mac_name is the name associated to the IP address of the Macintosh where MacX will be running. This name-IP_Adrress association is defined in /etc/hosts or in the Domain Name server or NIS server. If such a name has not been given to the Macintosh, the IP address can be use instead of mac_name.

Depending on how the xdm configuration files are setup, this should present you with the Login dialog from xdm each time MacX is started.

TOPIC ----------

I have A/UX 3.0 and just got a Centris 610 8/230/CD. I want to load A/UX on it instead of on my Macintosh IIci, but I can't install it successfully. Also, can A/UX run from an external drive?

DISCUSSION ----------

A/UX 3.0 does not support the Centris 610, Centris 650, or Quadra 800. However, the more recent release of A/UX, A/UX 3.0.1, supports the Centris 650 and Quadra 800. The Centris 610 lacks an FPU and, therefore, cannot run A/UX (unless there is a FPU upgrade solution from a third party).

Yes, you can install A/UX on an external drive with a supported Macintosh computer like the IIsi and be able to move the installed A/UX drive from one supported machine to another supported machine. A/UX automatically configures and rebuilds a new kernel when it finds a hardware change like a new Ethernet NB card.

At Ease 1.x: Saving Files (8/95)

Revised: 8/8/95
Security: Everyone

At Ease 1.x: Saving Files (8/95)

==========

Article Created: 28 May 1993
Article Reviewed/Updated: 08 August 1995

TOPIC----------

I'm having problems saving my files in At Ease, version 1.x.

DISCUSSION ----------

The only known problem with saving files in At Ease, version 1.x, is that some applications will save to folders on floppies while other applications will only save to the root level of the floppy.

Selecting "Save As" under the File menu will force saving to a floppy. Also, making a document a "stationary pad" by checking the appropriate box in the Get Info window will force saving documents to the floppy disk.

Saving to a hard drive can take place when the "Save to floppy" box is checked AND:
1) The finder is open in the background.
2) A document is already on the hard drive. The document can be opened and saved to the hard drive.

At Ease : Compressed Applications Not Found (8/95)

==========

Article Created: 28 May 1993
Article Reviewed/Updated: 08 August 1995

TOPIC -----

I'm using At Ease version 1.X. My compressed applications do not appear during "gather applications".

DISCUSSION -----

The problem is not with At Ease. Some compression utilities save the compressed applications as documents, therefore At Ease cannot find these as applications. At Ease is able to find documents, but your applications may not launch correctly if they appear as documents to At Ease.

System 7: Suitcase Extension and Automounting Hard Drives 8/95

==========

Article Created: 28 May 1993
Article Reviewed/Updated: 08 August 1995

TOPIC ----------

I have two Macintosh computers, let's call them Macintosh A and B. Both computers are on the same network and File sharing is turned on. When I start up Macintosh B, the internal hard drive of Macintosh A appears on the desktop of Macintosh B.

DISCUSSION ----------

This problem can happen with any Macintosh using System 7 and any version of Suitcase (a system extension from Fifth Generation Systems, Inc.).

The solution is to remove Suitcase 2.0 from Macintosh B and reinstall it using the original Suitcase diskette obtained from Fifth Generation Systems, Inc.

Here's an explanation of how this situation occurred:

- Suitcase is loaded on Macintosh A (file sharing is on and font or desk accessory suitcases are currently open with Suitcase).
- You copy the Suitcase extension from Macintosh A to Macintosh B.
- When Macintosh B starts up, the Suitcase on Macintosh B attempts to open the Suitcase on Macintosh A since those settings are stored within the Suitcase extension (on Macintosh A).
- If Macintosh A is on the same network as Macintosh B, the hard drive of Macintosh A will appear on the desktop of Macintosh B. Suitcase has connected to Macintosh A as the owner through AppleShare and Personal File Sharing in order to load the suitcase files from Macintosh A.

Powerbook: Adobe Type Manager 3.0 and Suitcase II 2.0 (5/93)

==========

Article Created: 28 May 1993
Article Reviewed/Updated: 22 July 1993

TOPIC ----------

My Powerbook crashes when I have Adobe Type Manager version 3.0 and Suitcase II, version 2.0 installed at the same time.

DISCUSSION ----------

There is a conflict between these two system extensions. The conflict only occurs on a Macintosh that use a system enabler. Macintosh systems introduced on or after October 19,1992 use enablers. This problem will also happen with the 32-Bit enabler, which customers might use on the Macintosh II, Macintosh IIx, Macintosh IIcx, or the Macintosh SE/30.

Adobe and Fifth Generation Systems, Inc. are aware of the problem and are working on it.Suitcase version 2.1.3 fixes this problem. Contact Fifth Generation Systems, Inc. for an update.

To locate a vendor's address and phone number, use the vendor's name as a search string.

A/UX: Memory Control Panel, Caching, and Swap Space (6/93)

Revised: 6/16/93
Security: Everyone

A/UX: Memory Control Panel, Caching, and Swap Space (6/93)

==========

Article Created: 10 June 1993

TOPIC ----------

In trying to understand the interactions of the Memory control panel and the A/UX paging space, I have come up with two questions:

First, what is the relationship between Disk Cache in the Memory control panel and the A/UX swap space?

Second, what is the relationship between Macintosh Virtual Memory in the Memory control panel and the A/UX swap space?

DISCUSSION ----------

To answer the first question, A/UX Disk Cache in the Memory control panel has no particular relationship to the A/UX swap space. Increasing the Disk Cache setting in the Memory control panel allocates more space for the Multifinder handling disk caching for Macintosh applications, while reducing memory available to the Finder. To see this increase, take a look at the size of "System Software" in the "About This Macintosh" dialog. A/UX kernel I/O buffering does the actual disk caching.

As to Virtual Memory in the Memory control panel, it is used to adjust the virtual memory space allocated for the A/UX MultiFinder. It has the same effect as the TBMEMORY environment specifier in .profile or .login. (Virtual memory is created in the A/UX Swap disk partition.)

For best performance, we suggest that you make the maximum virtual memory size no larger than twice the size of the physical RAM in the system. For instance, a system with 16MB of real RAM can enjoy a total of 32MB of virtual memory.

The A/UX virtual memory approach is different than that in the Mac OS.

A/UX virtual memory is handled by the A/UX demand paging system scheme. Pages can be swapped in and out between real memory and the swap space by demand.

Note that the swap space is used by both A/UX Finder and UNIX processes. If a Macintosh application requests virtual memory space exceeding available Finder virtual memory, it acts as it does in the Mac OS; it asks you to close some application, so it can release memory. If a UNIX process needs virtual space exceeding the available swap space, the kernel returns a "run of swap space" message.

In short, depending on what you are doing, you should adjust your swap space and the virtual memory allocation (via the Memory control panel or TBMEMORY) as appropriate to the Macintosh enviornment.

Disk Cache: Saving Files is Slow (5/93)

Revised: 6/1/93
Security: Everyone

Disk Cache: Saving Files is Slow (5/93)

==========

Article Created: 28 May 1993

TOPIC ----------

I have an Excel (4.0) spreadsheet that took forty seconds to save on my Macintosh IIfx. The same spreadsheet takes two minutes and five seconds to save it on my Quadra 900. The software on the Quadra is identical to that on the IIfx. I have removed all my extensions, File Sharing and Virtual Memory settings are off, and I have the disk cache set to 512K.

DISCUSSION ----------

The slowness is caused by the time it takes to search the large disk cache, in this case, 512K. Disk cache is a portion of the computer's random-access memory (RAM) that is set aside for programs to store frequently used instructions. It's function is to speed certain operations, but in some cases, such as this, it can actually slow down an operation when set to large. It takes longer to search the cache than it would to simply read the instructions from the disk.

Apple recommends a default value of 32K of disk cache per 1MB of physical RAM installed in your Macintosh. However, you should experiment with the disk cache settings to find the value which is best for your specific needs.

This behavior is independent of the computer model and System Software versions, System 6.0.x or 7.x.

- In System 6 the disk cache is set in the "General" Control Panel.
- In system 7 the disk cache is set in the "Memory" Control Panel.

PowerBook: Backlight Control CDEV (5/93)

Revised: 7/7/94
Security: Everyone

PowerBook: Backlight Control CDEV (5/93)

==========

Article Created: 28 May 1993

TOPIC -----

This article describes Backlight Control version 1.0.

DISCUSSION -----

Backlight Control is a control panel that monitors the mouse activity, the keyboard activity, and the charger status of the PowerBook. It turns the backlight off when the mouse has been idle for a certain amount of time (user specified) and you are working from the battery. As soon as you move the mouse, click the mouse, start typing, or plug in your power adapter the backlight comes back on.

The Control Panel interface allows you to:

- Turn on or off the Backlight feature
- Select the idle timeout
- Check for a power adapter or not
- Monitor the keyboard or not

Backlight Control should work on any PowerBook with backlighting. Newer PowerBooks and Duos ship with system software that has this same functionality.

Version 1.0 changes only the version number and icons. Version 1.0a3 adds mouse click detection and should work on all backlit portables.

You can distribute this version outside Apple. Bulletin board sysops and developers need to contact Apple Software Licensing for distribution.

NewsWatcher Software: Description (5/93)

Revised: 6/1/93
Security: Everyone

NewsWatcher Software: Description (5/93)

==========

Article Created: 28 May 1993

TOPIC ----------

This article describes the NewsWatcher software, and tells how to use it.

DISCUSSION ----------

NewsWatcher is used to participate in "USENET news." USENET news (or just "USENET" or "the news" for short) is a worldwide distributed electronic bulletin board system. Anyone on the Internet can post articles to USENET, and anyone on the Internet can read articles and post replies.

USENET is organized as a hierarchical system of several thousand separate "newsgroups" (or just "groups" for short). Each group is devoted to a single topic. The topics range from recreational groups like "alt.archery" to technical groups like "comp.protocols.appletalk".

For best results with NewsWatcher, use a Macintosh with 2MB or more of memory and a hard drive. NewsWatcher requires System 6.0.5 or later. It's compatible with System 7. You must have the Macintosh connected to the Internet, and you must properly install and configure MacTCP. For dialup use, NewsWatcher works with MacSLIP and the other Macintosh SLIP products, and with AppleTalk Remote Access.

NewsWatcher is free. It may not be resold for profit or included with software which is sold for profit, but otherwise you should feel free to use it and redistribute it.

The official anonymous FTP site for NewsWatcher and the documents is ftp.acns.nwu.edu [129.105.113.52], directory pub/newswatcher. If you would like to receive announcements of new NewsWatcher releases, send a request to NW_Info-request@let.ruu.nl.

Apple doesn't support the program. Refer to the program documentation for further assistance.

QuickTime: Saving Audio Sounds as QuickTime Movie (5/95)

Revised: 5/23/95
Security: Everyone

QuickTime: Saving Audio Sounds as QuickTime Movie (5/95)

==========

Article Created: 28 May 1993
Article Reviewed/Updated: 23 May 1995

TOPIC ----------

If you have an AppleCD 300e, 300i, 600e, or 600i and QuickTime 1.6 or later, you can:

1) Open an Audio CD track from within any QuickTime application (like Simple Player or MoviePlayer).

2) Select a track, and save it as a sound file on a hard drive with either 22Khz or 44KHz sampling rate, 8- or 16-bit resolution, and either stereo or mono.

DISCUSSION ----------

Here are the details. Follow these steps:

1) Start the application.
2) Select Open from the file menu.
3) Navigate to the Audio CD (in the drive) and select a track.
4) Select Convert.
5) Select Options to change resolutions and other parameters.

The music will be transferred and saved as a QuickTime movie. You can then use an application like Premiere or SoundEdit 16 to save the track into AIFF format for use elsewhere.

The audio data, instead of just going out the RCA jacks or the headphone jack, gets transferred through the SCSI bus with no loss of fidelity or added signal noise as you get when going "out" of the CD then "in" a sampling card or unit. Of course, you need the disk space (44KHz, 16-bit stereo sound takes a lot of disk space).

Also, because most Macintosh hardware only supports the output of 8-bit sound, samples that are played will sound scratchy, because of the process of

converting 16-bit sound to 8-bit sound. Converting the 16-bit CD Tracks to an 8-bit sound will produce 'scratchy' results, even if later played by 16 bit hardware. For best results, save sounds as 16-bit, and use a third party sound card that supports 16-bit sound. The exception to this are the Quadra and Centris AV models and Power Macintosh models, which support 16-bit output without the addition of a third-party sound card.

Article Change History:
23 May 1995 - Made article more version generic.
11 Aug 1993 - Reordered steps. Added information about 16-bit audio.

LaserWriter Driver: System 6 and System 7 Environment (5/94)

Revised: 5/13/94
Security: Everyone

LaserWriter Driver: System 6 and System 7 Environment (5/94)

==========

Article Created: 27 May 1993
Article Reviewed/Updated: 12 May 1994

TOPIC ----------

I have a mixed network of Macintosh computers using System 7 and System 6. I just purchased a LaserWriter Pro 630. Am I going to have network printing problems?

DISCUSSION ----------

We suggest you use LaserWriter driver 7.2 in your mixed environment. The 7.2 driver added support for the LaserWriter Pro series.

A bug with PrintMonitor 7.1 and System 6 was found too late in the LaserWriter Pro series development to correct it before shipping. PrintMonitor's "Set Print Time" option will crash on systems prior to 7.0. PrintMonitor 7.1 was shipped with the LaserWriter Pro series, and will automatically install over the previous version. The Installer checks to see what version of system software (System 6 or System 7) is installed so that it places all the resources in their proper places.

LaserWriter driver 7.2 is compatible with PrintMonitor 7.0. Therefore after installing the LaserWriter Pro software, System 6 users need to downgrade to PrintMonitor 7.0. There is NO need to recommend that System 6 users upgrade to System 7 for their printing needs.

Apple recommends using the Installer disk when upgrading printer drivers. However, System 7 users can upgrade their systems by dragging the 7.2 driver to the System Folder. System 6 users can upgrade by dragging the LaserWriter driver, PrintMonitor, Backgrounder, and LaserPrep to their System Folder.

Early versions of the LaserWriter Drivers for System 7 were tested with all System 6 versions. Later LaserWriter Driver versions were only tested with System 6.0.8, and is the only System 6.x version now officially supported by Apple.

Article Change History:
12 May 1994 - Added section on System 6.0.8.

AppleCD 300: Audio Out Jack Impedance (9/95)

Revised: 9/7/95
Security: Everyone

AppleCD 300: Audio Out Jack Impedance (9/95)

==========

Article Created: 1 June 1993
Article Reviewed/Updated: 7 September 1995

TOPIC ----------

What is the impedance of the audio out jacks on the AppleCD 300?

DISCUSSION ----------

The impedance for the sound out ports of the AppleCD 300 is about 47k Ohms (High Z) . This means that the audio cable connections should be kept as short as possible to avoid high frequency losses in the audio signal.

By industry convention, Low Z (Low Impedance) consists of any impedance below 600 Ohms. High Z (High Impedance) would be in the range of 10k Ohms and above.

PowerBook 145B: Specifications (6/93)

Revised: 7/7/94
Security: Everyone

PowerBook 145B: Specifications (6/93)

==========

Article Created: 7 June 1993
Article Reviewed/Updated: 26 August 1993

TOPIC ----------

This article provides technical specifications for the PowerBook 145B computer.

DISCUSSION ----------

Microprocessor

- 68030, clock speed 25 MHz
- 32-bit Address Bus, 32-bit Data Bus

Memory

- 4MB pseudostatic RAM (PSRAM) built-in (on the "daughterboard").
- Expandable to 6MB or 8MB RAM with installation of a 2MB or 4MB PSRAM expansion card in the RAM expansion slot. RAM designed for the PowerBook 100, 140, 145, and 170 works in the PowerBook 145B.

  Note: The PowerBook 145B's RAM expansion slot can accept a 6MB expansion card, for a total of 10MB, but only 8MB will be recognized and used.

Disk Storage

- One built-in 1.4MB SuperDrive uses high-density floppy disks; it reads, writes, and formats Macintosh, MS-DOS, OS/2, and ProDOS disks.
- One internal 40MB or 80MB hard disk

System Software

Ships with System 7.1. Requires System 7.0 or later.

Note: With System 7.0 or 7.0.1, the Finder's "About This Macintosh..." message reports "PowerBook 145" rather than PowerBook 145B.

Display

- 32K VRAM supports one-bit (monochrome) video.
- 10 inch (254 mm) diagonal
- Backlit Supertwist passive-matrix liquid crystal display
- 640 by 400 pixels

Battery

- NiCad, 2.9 ampere-hours, provides 2 to 3 hours of use before recharging is necessary
- Recharge time: 100% recharged after 5 hours; 80% recharged after 3 hours
- Uses same battery and recharger as PowerBook 140, 145, and 170.

Keyboard

- Built-in keyboard with standard Macintosh layout
- Two-level tilt adjustment

Trackball

- Dual-button trackball, 30 mm diameter,

Clock/Calendar

- CMOS custom chip with long-life lithium battery

Interfaces

- One Apple Desktop Bus (ADB) port for keyboard, mouse, and other devices using a low-speed, synchronous serial bus.
- Two RS-422 serial ports for LocalTalk networking, printers, modems, and other devices. One of these ports is disabled when internal modem is used.
- One HDI-30 SCSI port for hard disks, scanners, CD-ROM drives, and other devices.
- One sound output port for external audio amplifier.
- One sound-in port.

Modem

- Optional internal 2400-baud modem with fax send at 9600 baud; includes fax send software.
- Error correction and compression: MNP 4, 5 and V.42, V.42bis

Sound Generator

- Apple Sound Chip provides 8-bit sound, capable of driving stereo headphones or other stereo equipment through the sound port.

Sound Input

- 8-bit sound, sampled at 11 or 22 kHz

Disability Access

- CloseView, Easy Access, and visible beep included with system software. These built-in solutions and third-party options provide alternative input and output devices for people with disability.

ADB Power Requirements

- Maximum current draw for all ADB devices is 200 milliamps (a maximum of three ADB devices is recommended)

Electrical Requirements

- AC Power Adapter II is included
  (do not use any power adapter not designed for PowerBook)
- Line voltage: AC 100 to 240
- Frequency: 50 to 60 Hz

Environmental Requirements

- Operating temperature: 50° F to 104° F (10 to 40° C)
- Storage Temperature: -40° F to 149° F (-40 to 65° C)
- Relative humidity: 20% to 80% noncondensing
- Operating altitude: max. 10,000 ft. (3048 m) This limit does not apply to pressurized aircraft cabin.
- Storage altitude: max. 15,000 ft. (4722 m)

Size and Weight

- Height 2.25 inches (5.7 cm)
- Width 11.25 inches (28.6 cm)
- Depth 9.3 inches (23.6 cm)
- Weight 6.8 lb (3.03 kg)

Noise Level

Noise free except for floppy or hard disk use.

Article Change History

26 August 1993 - Revised article with correct storage temperature

PowerBook 145 and 145B: Differences (6/93)

Revised: 7/7/94
Security: Everyone

PowerBook 145 and 145B: Differences (6/93)

==========

Article Created: 7 June 1993

TOPIC ----------

This article summarizes the differences between the PowerBook 145 and the PowerBook 145B.

DISCUSSION ----------

RAM

• The PowerBook 145's 4MB configuration has 2MB RAM on the logic board and 2MB in the expansion slot. To expand RAM beyond 4MB, the user must replace the 2MB expansion card with a higher-capacity RAM card.

• The PowerBook 145B, on the other hand, comes with 4MB RAM on the logic board, allowing expansion beyond 4MB without having to first remove 2MB from the expansion slot.

	Standard On-board RAM	Maximum RAM
PowerBook 145	2MB or 4MB	8MB
PowerBook 145B	4MB	8MB

Floppy Disk

Only one floppy disk is shipped with the PowerBook 145B: Disk Tools, which includes Restore software. Special backup software for the PowerBook 145B is installed on the hard drive, which customers can use to back up their System software to floppy disks.

Microphone

The microphone is optional, not included with the PowerBook 145B.

PowerBook 180c: Specifications (Discontinued)

==========

Article Created: 7 June 1993
Article Reviewed/Updated: 22 March 1995

TOPIC ----------

This article provides technical specifications for the PowerBook 180c computer, which was discountinued by Apple on 14 March 1994.

DISCUSSION ----------

Microprocessor

- 68030, clock speed 33 MHz.
- 68882 Math Coprocessor, 33 MHz.
- 32-bit Address Bus, 32-bit Data Bus

RAM

- 4MB pseudostatic RAM on logic board.
- Expandable to 14MB with expansion PSRAM cards (2, 4, 6, 8, and 10MB capacities).
- Contents of RAM saved in Sleep mode, lost at shutdown

Storage

- One built-in 1.4MB Apple SuperDrive disk drive that uses high-density floppy disks; it reads, writes, and formats Macintosh, MS-DOS, OS/2, and ProDOS disks.
- One internal 80MB or 160MB hard disk.

System Software

- Requires System 7.1 or later
- System Enabler specifically for PowerBook 180c

Display

• 8.4 in. (226 mm) diagonal backlit color active-matrix LCD
• 640 x 480 pixels
• Up to 256 colors from a palette of 4096 choices
• 512K VRAM
• External display port (mini-15) supports 8-bit video
• External display options:
  Macintosh 12" Monochrome Display
  Macintosh 12" RGB Display
  AppleColor High Resolution RGB Display
  Macintosh Color Display
  Macintosh 16" Color Display
  Macintosh Portrait Display
  Some VGA and SVGA monitors
• Two video-out modes:
  - Video mirroring for simultaneous display of the same image on two screens.
  - Dual display for full use of both screens.

Battery

• NiCad (nickel-cadmium), provides 1.5 to 2 hours of use before recharging is necessary. (AC power adapter is included.)

Keyboard and Trackball

• Built-in keyboard with standard Macintosh layout and two-level tilt adjustment.
• Dual-button trackball, 30 mm diameter.

Clock/Calendar

• CMOS custom chip with long-life lithium battery.

Microphone

• Built-in omnidirectional; output voltage is 4 mV, peak to peak, at normal volume

Interfaces

• One Apple Desktop Bus (ADB) port for keyboard, mouse, and other devices.
• Two RS-422 serial ports for LocalTalk networking, printers, modems, and other devices.
• One HDI-30 SCSI port for hard disks, scanners, CD-ROM drives, and other devices.
• One slot for optional modem.
• One video-out port, supporting 8 bit density and 256 colors.
• One stereo sound output port for external audio amplifier or headphones.
• One mono sound-in port.
• Security slot for use with third-party equipment to lock the computer.
• SCSI Disk Mode with optional SCSI Disk Adapter

Modem

- Optional internal PowerBook Express Modem; 14,400 bits per second (bps) data with fax send and receive at 9600 bps; includes Express Fax software.
- Optional internal 2400 bps modem with fax send at 9600 bps; includes fax send software.

Sound Generator

- Apple Sound Chip provides 8-bit sound, capable of driving stereo headphones or other stereo equipment through the sound port.

Sound Input

- 8-bit sound, sampled at 11 or 22 kHz.

Disability Access

- CloseView, Easy Access, and visible beep included with system software. These built-in solutions and third-party options provide alternative input and output devices for people with disabilities.

ADB Power Requirements

- Maximum current draw for all ADB devices is 200 milliamps (a maximum of three ADB devices is recommended)

Electrical Requirements

- Line voltage: 100 to 240 volts, 50 to 60 Hz

Environmental Requirements

- Operating temperature: 50 to 104° F (10 to 40° C)
- Storage Temperature: -40°F to +149°F (-40 to +65° C)
- Relative humidity: 20% to 80% noncondensing
- Altitude: Operating: 3048 m (10,000 ft.) maximum

Shipping (non-operating) 0 to 15,000 ft. (0 to 4,722 m)

Size and Weight

- Height: 2.34 in. (5.9 cm)
- Width: 11.25 in. (28.6 cm)
- Depth: 9.3 in. (23.6 cm)

PowerBook 165c, 180, 180c: Differences (6/93)

Revised: 7/7/94
Security: Everyone

PowerBook 165c, 180, 180c: Differences (6/93)

==========

Article Created: 7 June 1993

TOPIC ----------

This article summarizes the differences among the PowerBook 165c, 180, and 180c.

Key differences:
- PowerBook 180 is active-matrix gray-scale, 165c is passive-matrix color, and 180c is active-matrix color. The color models have smaller display screens (when measured diagonally), but have more pixels for higher resolution.
- The batteries in the color systems need more frequent recharging.
- The color systems are slightly taller and heavier.
- 160MB hard drive is a PowerBook 180c option.

In addition, the PowerBook 180c has stricter temperature ranges (see the specifications).

DISCUSSION ----------

	180	165c	180c
Built-in Display			
• Display type	active-matrix	passive-matrix	active-matrix
• Display size	10 in. diag.	9 in. diag.	8.4 in. diag.
• Pixels	640 x 400	640 x 400	640 x 480
• Colors	16 grays	256	256
Dimensions			
• Height	2.25 in.	2.29 in.	2.34 in.
• Weight	6.8 lb.	7.0 lb.	7.1 lb.
Misc.			
• Hard drive	80/120MB	80/120MB	80/160MB

• Battery charge	2.5 - 3 hr.	1.5 - 2 hr.	1.5 - 2 hr.

Macintosh Access To DEC's InfoServer 150 (6/93)

Revised: 6/4/93
Security: Everyone

Macintosh Access To DEC's InfoServer 150 (6/93)

==========

Article Created: 1 June 1993

TOPIC ----------

What software is needed for a Macintosh to interact with DEC's InfoServer? I believe it's CD-ROM based.

DISCUSSION ----------

To access InfoServer, you need "InfoServer Client for Macintosh Media and Documentation Kit, part number QA-YSHAE-HB/CJV."

DEC's InfoServer is a network storage server that lets you share software and information. The InfoServer 150 delivers information to up to 100 clients, which can be Macintosh, DOS, RISC workstations, or VAX users. It supports 14 SCSI devices, including CD-ROM, hard disk, tape, and magneto-optical drives.

For more information, call 1-800-DIGITAL, and press 2 for complete information on InfoServer 150 client software. To locate a vendor's address and phone number, use the vendor name as a search string.

Revised: 6/8/93
Security: Everyone

Directory Structure: Symptoms of Damage and How to Repair (6/93)

==========

Article Created: 2 June 1993

TOPIC ----------

My PowerBook crashed, and required a restart using the power on button. After restarting, the folder labeled "Applications" was entirely empty. Before the crash it contained various applications in their respective folders. Aliases to the applications still operate correctly, starting the application the same as always. But, if I select the alias, do a Get Info, then Find Original, I receive an error.

DISCUSSION ----------

These are generic symptoms that describe a corrupted directory structure. Don't continue to use this computer as you are in danger of continuing the damage to an unrecoverable situation. Immediately use disk utilities to:

1) Backup what you have, and then

2) Recover what is on the disk.

You can certainly use something such as Disk First Aid to scan the disk. Beyond this, there are a number of excellent utilities to try such as Mac Tools or Norton Utilities.

CD Remote: Recognizes Lowest SCSI ID Setting Only (5/93)

Revised: 6/2/93
Security: Everyone

CD Remote: Recognizes Lowest SCSI ID Setting Only (5/93)

==========

Article Created: 2 June 1993

TOPIC ----------

I have a Macintosh with two Apple CD-ROM drives connected in the SCSI chain (a CD 300i and a CD SC Plus).

If I put an audio CD in the internal CD 300i, CD Remote works well. However, when I put the same audio CD into the external AppleCD SC Plus, CD Remote does not recognize the audio CD. The audio CD mounts on the desktop fine although I can not control it from CD Remote.

DISCUSSION ----------

CD Remote will only recognize the CD-ROM player with the lowest SCSI ID setting. CD Remote is unable to play audio CDs from the external AppleCD SC Plus because the internal CD 300i has a lower SCSI ID.

The Macintosh will recognize the audio CD as a valid volume to be mounted on the desktop because of Foreign File Access which is installed with the CD-ROM installation software. However, since the file format of the audio CD is unknown to the Macintosh file system there is little that can be accomplished from the desktop.

It is only the CD Remote that does not recognize the audio CDs when they are placed in secondary CD-ROM drives (secondary equals higher SCSI ID number).

There are several audio CD software controllers on the market that have appeared as shareware and freeware. It may be that one of these will allow the selection of which player is to be used for playing audio CDs.

Apple Early Learning Connections: Grady Profile Error T106

Revised: 6/2/93
Security: Everyone

Apple Early Learning Connections: Grady Profile Error T106

==========

Article Created: 2 June 1993

TOPIC ----------

This article discusses a problem when using the Grady Profile in the Apple Early Language Connections.

DISCUSSION ----------

When you record a reading sample in the Grady Profile with a name that's too long, you receive "Error T106" messages. You must keep the title of the reading sample to 31 characters or less (this includes spaces and punctuation).

Example: Naming the sample "The Emperor's New Clothes 12/13/92" it is too long. Shortening the title to "Emperor's New Clothes 12/13/92" corrects the problem.

Macintosh II PMMU Upgrade: No Video (6/95)

Revised: 6/21/95
Security: Everyone

Macintosh II PMMU Upgrade: No Video (6/95)

==========

Article Created: 28 May 1993
Article Reviewed/Updated: 21 Jun 1995

TOPIC----------

I had a problem with a Macintosh II manufactured in 1988. When I installed a PMMU, there was no video.

DISCUSSION----------

In 1988, a small batch of Macintosh II systems were manufactured with an HMMU-unique socket that does not allow the CPU to function properly if a PMMU upgrade is installed.

The exact serial numbers are not known, but Apple offered a logic board swap to anyone demonstrating this problem.* You can identify the HMMU-unique logic board by removing it and looking at the underside of the board where the HMMU socket is.

- The HMMU-unique socket will have 70 gold contacts soldered through the board in a random pattern.
- The HMMU/PMMU socket will have 132 gold contacts soldered in a 13-by-13 pin pattern.

When a PMMU upgrade is installed in a Macintosh II containing an HMMU-unique socket, many pins do not connect and the system will not start up. If you have the HMMU-unique socket, there is a Repair Extension Authorization for the boards that qualify for an upgrade. Any dealer can contact Tech Support for information about this.

*This Repair Extension has expired as of May 3, 1995.

Article Change History:
21 Jun 1995 - Added expiration information

At Ease: Icon on Floppy Not Copied to At Ease Screen (8/95)

Revised: 8/8/95
Security: Everyone

At Ease: Icon on Floppy Not Copied to At Ease Screen (8/95)

==========

Article Created: 27 May 1993
Article Reviewed/Updated: 08 August 1995

TOPIC ----------

The icon of an application on a floppy disk won't copy to the At Ease screen; At Ease only shows the generic icon for the application unless I cut and paste the icon to the alias.

DISCUSSION ----------

The icons used by At Ease must be in the desktop file of the hard drive. You can rebuild the desktop file with the application present on the hard drive, then remove the application, or you can cut and paste an icon into the Get Info window for the alias as you have done already. This is the same way the Finder functions.

INIT-M Virus: Use Disinfectant 3.2 (5/93)

Revised: 6/14/93
Security: Everyone

INIT-M Virus: Use Disinfectant 3.2 (5/93)

==========

Article Created: 28 May 1993

TOPIC --

A virus called INIT-M is designed to trigger on any Friday the 13th. Disinfectant version 3.2 fixes "infected" files.

DISCUSSION --

The virus may infect all kinds of files -- including extensions, applications, preference files, and document files -- causing problems with the proper display of windows. The virus spreads and attacks only under System 7.0 or later. It does not spread or attack System 6.

Disinfectant 3.2, Northwestern University's free Macintosh anti-viral utility, detects files infected by the INIT-M virus. This version also fixes an error in the way Version 3.1 made changes to the damaged file detection code and increases Disinfectant's preferred memory partition from 700K to 1000K. The increased memory corrects a problem scanning some specific applications with very large CODE resources, including PSpice and Intellidraw.

Disinfectant 3.2 is available on electronic bulletin boards as well as AppleLink. The AppleLink path is:

Quadra 800: Jumper Controls System ID and System Software (2/95)

Revised: 2/15/95
Security: Everyone

Quadra 800: Jumper Controls System ID and System Software (2/95)

==========

Article Created: 1 June 1993
Article Reviewed/Updated: 15 February 1995

TOPIC ----------

I have a Quadra 800 that generates an error at start up stating that a newer version of System Software must be used on this computer. System Software 7.1 is already installed and has the correct enabler.

The Quadra 800 won't start up from the Install Me First or Disk Tools disks. This began happening after additional RAM was installed, but it has also happened after installation of VRAM and after installation of internal SCSI devices.

DISCUSSION ----------

Connector J25 on the main logic board, which is the connector for the power LED, has a pin jumpered to indicate the computer's ID. If this cable assembly is not attached to the logic board correctly, the Quadra 800 may identify itself as a Quadra 650 or fail to boot with an error about incorrect system software.

Check to see that the cable assembly is in place, and that the wires in the assembly are making the necessary connections. The jumper connects pins 2 and 3 of the Power LED connector. Pin 1 of the connector is closest to the back of the computer.

Article Change History:
15 Feb 1995 - Added info on why Quadra 800 would identify itself as a Quadra 650 in the About this Macintosh box.

Color Classic, LC 5xx, Performa 5xx: Won't Start From Kbd (2/94)

Revised: 2/24/94
Security: Everyone

Color Classic, LC 5xx, Performa 5xx: Won't Start From Kbd (2/94)

==========

Article Created: 1 June 1993
Article Reviewed 2/24/94

TOPIC ----------

I am unable to start up a Color Classic. I plug it in and turn on the power switch on the back. Nothing happens yet, which I realize is normal. But when I press the power on key on the keyboard, which should start the computer, nothing happens.

DISCUSSION ----------

The Macintosh LC 520, 550, 575 and the Macintosh Performa 500 series use similar power on technology, the following steps apply to those systems also.

Before assuming that there is a hardware problem with this Color Classic, try resetting the Parameter RAM. Under System 7, the procedure for resetting the Parameter RAM is to hold down the Command, Option, P, and R keys immediately upon startup. But since this Macintosh won't even begin to start up, follow an alternative procedure for resetting the Parameter RAM:

- Refer to the User's Manual instructions on how to replace the lithium battery inside the computer.
- Pull the battery out for about 10 minutes, then put it back in and put the computer back together.

The PRAM should then be reset, and, if there are no other problems, the computer should start up successfully.

Unlike previous compact Macintosh models (such as the Classic and the SE), the Macintosh Color Classic, LC 520, and Performa 5XX have a two-step startup sequence. First, you must switch on the power switch on the back of the computer. Then you must press the power key on the keyboard itself (the key with a left-pointing triangle; this is the normal startup method for

Macintosh II-class computers).

Article Change History
2/24/94 - Added LC 520 and Performa 5xx series to article.

Inter•Poll 1.0.1: Read Me File - Discontinued Product (6/94)

Revised: 6/3/94
Security: Everyone

Inter•Poll 1.0.1: Read Me File - Discontinued Product (6/94)

==========

Article Created: 3 June 1993
Article Reviewed/Updated: 3 June 1994

TOPIC ----------

This article is the Inter•Poll 1.0.1 Read Me file. This product is discontinued.

DISCUSSION ----------

Inter•Poll version 1.0 is mostly compatible with System 7, and version 1.0.1 is fully compatible. The Inter•Poll Read Me follows; however, what isn't reflected in this Read Me is that v1.0.1 contains mostly bug fixes, some significant and some minor. Also not reflected in the Read Me is that the Responder functionality is now built into System 7, and installing System 7 removes the Responder extension from a System 6 system.

Inter•Poll Read Me

What's New in Inter•Poll 1.0.1

1) Inter•Poll is now compatible with the Macintosh IIx and the Macintosh SE/30 computers.

2) The version of Responder included on the enclosed disks identifies the Macintosh IIx and the Macintosh SE/30 accurately. Replace prior versions of Responder if necessary.

3) System 6.0.3 has replaced System 4.3.

4) The Inter•Poll network map symbols are included in the PICT format, which will allow the map symbol files to be opened by a wide range of applications, including MacDraw.

General Information

Inter•Poll provides a set of tools that help network administrators to manage their AppleTalk network systems more efficiently and to provide greater network reliability for their users.

Installing and operating Inter•Poll will require the selection of a network administrator who is responsible for maintaining the network. Inter•Poll should be installed on the administrator's workstation and generally operated from that location (although network problems affecting this workstation may at times require Inter•Poll to be run from another location).

Any device on the network can be selected from one of the list windows and targeted for individual testing using loopback tests. This is a method that aids in localizing network faults by enabling test packets to be sent to a device. Three types of test packets can be sent: Echo, Printer (Printer Access Protocol or PAP), and System Information packets. Note that, though Inter•Poll does not prevent the user from sending any type of packet to any device, some device software may be unprepared to accept certain types of packets. It is recommended that only echo packets be sent to devices that are of unknown or unnamed type.

1) Inter•Poll: This is a Macintosh application that finds and displays all active devices connected to an AppleTalk network, or a subset as defined by search criteria. Inter•Poll will run on a Macintosh Plus, Macintosh SE, or Macintosh II computer with System file version 4.1 or later, or on a Macintosh IIx or a Macintosh SE/30 computer with System file version 6.0.3 or later. Inter•Poll will also run in the foreground of an AppleShare File Server version 2.0 or later. (Refer to AppleShare File Server's documentation for installation instructions.)

2) Network Mapping Symbols: This is a folder containing three PICT files with symbols for network devices and sample floor plans that help the network administrator to build an accurate network map and to keep it current. These files can be opened from a variety of graphics applications, including MacDraw.

In the System Folder:

3) Responder: This is the companion Macintosh INIT file to the Inter•Poll application. Inter•Poll works together with Responder to identify all active AppleTalk devices, including Macintosh, Apple // and MS-DOS workstations. Responder is installed into a Macintosh computer workstation by placing a copy of the Responder file into each workstation system folder and restarting. Be sure to remove any old versions that might be present when installing Responder.

Article Change History:
03 Jun 1994 - Updated to show Inter•Poll 1.0.1 is a discontinued product.

AppleCD 300i: Using with Kodak Photo CD Discs (6/93)

Revised: 6/4/93
Security: Everyone

AppleCD 300i: Using with Kodak Photo CD Discs (6/93)

==========

Article Created: 4 June 1993

TOPIC --

If you're having difficulty using Photo CD discs in the AppleCD 300i, here are some things to check.

DISCUSSION --

Apple and Kodak have thoroughly tested the AppleCD 300i for Photo CD disc compatibility. You must use CD-ROM Setup 4.0.2 or later, and QuickTime 1.5 or later.

Photoshop uses its own form of virtual memory to spool in images that are larger than the available RAM can accommodate. Be sure you have sufficient hard disk space for virtual memory. Having plenty of RAM improves performance further.

File Assistant: Turning Off Synchronizer Alert Messages (6/93)

Revised: 6/4/93
Security: Everyone

File Assistant: Turning Off Synchronizer Alert Messages (6/93)

==========

Article Created: 7 June 1993

TOPIC ----------

As you synchronize linked pairs, the PowerBook File Assistant displays messages about the synchronization. These alert messages appear to tell you what's happening, and if files can't be synchronized, they tell you why. If you're synchronizing several pairs of files, you may want to turn off the alert messages so they don't appear on the screen.

DISCUSSION ----------

To turn off alert messages, follow these steps:

1) Choose Preferences from the File menu.

2) Click the Warn When Can't Synchronize check box to deselect it.
   If you don't want alert messages to appear when a file or folder is put in the trash, you can click the box next to Warn Before Deleting to deselect it.

   WARNING: Be very careful if you turn off the alert messages when files are put into the trash. The File Assistant puts a file or folder in the trash during synchronization whenever its corresponding file or folder is deleted or renamed. If you turn these alert messages off, the messages notifying you when a file is put in the trash don't appear.

3) Click OK.

To turn off alert messages temporarily, hold down the Option key. While you hold down the Option key, the alert messages for any commands you execute are turned off.

PowerBook File Assistant: Automatic Synchronization (7/95)

Revised: 7/20/95
Security: Everyone

PowerBook File Assistant: Automatic Synchronization (7/95)

==========

Article Created: 7 June 1993
Article Reviewed/Updated: 20 July 1995

TOPIC ----------

This article discusses how to turn on automatic synchronization in the Synchronizer of the File Assistant software.

DISCUSSION ----------

To update files you have linked automatically whenever a change is made to either of the linked files, choose Automatic from the Synchronize menu with the pair selected. A message appears whenever files are being updated.

You can set up your PowerBook so files are updated every time you connect with another disk. Follow these steps:

Step 1
Choose Automatic from the Synchronize menu with the pair selected.

Step 2
Use the AutoRemounter control panel to reconnect to shared disks.

Step 3
Drag an alias of the PowerBook File Assistant icon to the Startup Items folder (the PowerBook System Folder).

File Assistant: Increasing Battery Life (6/93)

Revised: 7/7/94
Security: Everyone

File Assistant: Increasing Battery Life (6/93)

==========

Article Created: 7 June 1993

TOPIC ----------

This article discusses the key features of File Assistant that are designed to increase battery life.

DISCUSSION ----------

The PowerBook Display

The backlight is one of the major power consumers on the PowerBooks. Approximately 1/3 of the power is used to illuminate the display with the backlight. Viewing the screen without a backlight however, is difficult and usually impossible. Screen Dimming saves power and allows the user to see the screen during usage.

The Screen Dimming panel of the PowerBook Display control panel provides controls over Automatic screen dimming. This panel displays only if the portable computer is capable of software control over the backlight and/or external monitor.

SCSI Sleep Fkey

With SCSI Sleep, you can put the PowerBook to sleep immediately by pressing the shift, command, and 0 keys simultaneously. When you add the Control key to this sequence, just the hard disk spins down. This gives easier access to system sleep and longer battery life.

Permanent RAM Disk

There's one new feature added to the RAM disk option of the Memory Control Panel. Any files copied to the RAM disk are saved to disk upon shut down or restart, and then copied back to the RAM disk upon startup. This saves rebuilding the RAM disk at every restart.

This first version of the Permanent RAM Disk doesn't support instant booting, so using it as a system volume requires a restart.

Assistant Toolbox: Description (10/95)

Revised: 10/31/95
Security: Everyone

Assistant Toolbox: Description (10/95)

==========

Article Created: 7 June 1993
Article Reviewed/Updated: 31 October 1995

TOPIC ----------

What does the Assistant Toolbox extension that comes with most PowerBook computers do?

DISCUSSION ----------

The Assistant Toolbox extension adds several features and functionalities to a PowerBook:

* Battery Management
The Assistant Toolbox adds to the base operating system's ability to better manage battery life.

* Persistent RAM disk
The Assistant Toolbox gives the PowerBook the ability to save RAM disk data to the hard disk when shutting down and read it back in when starting up. Normally, a RAM disk is lost when the PowerBook computer is completely shut down.

* Sleep Fkey
Using the key sequence Command (Apple), Shift, 0 (the number), you can quickly put the PowerBook to sleep.

* Later Laser
Later Laser allows deferred printing of documents when the PowerBook computer is disconnected from a printer or network. When you reconnect, the documents print when the printer is available. Later Laser is only active when a laser printer is chosen.

* SCSI Sleep
SCSI Sleep mounts any previously connected hard drives as a PowerBook comes out of sleep.

* Anti-Submarining Cursor
The Anti-Submarining Cursor feature corrects a software issue that caused the "submarining" cursor effect on gray-scale passive-matrix displays. "Submarining" is when the cursor disappears as it is moved quickly. This is an important feature for all PowerBooks, except the 170 and 180.

* Always AppleTalk
The Always AppleTalk feature lets you activate AppleTalk without restarting the computer.

All of these features are built in to the Assistant Toolbox extension and are loaded automatically when the extension is loaded.

PowerBook File Assistant: Requirements for Installing (6/93)

Revised: 6/10/93
Security: Everyone

PowerBook File Assistant: Requirements for Installing (6/93)

==========

Article Created: 7 June 1993

TOPIC ----------

This article tells you what software File Assistant installs, and what you need to install it.

DISCUSSION ----------

For further information on PowerBook File Assistant, please refer to the article titled "Assistant for PowerBooks: Software Components" also located in the Technical Information Library.

Requirements

To use the PowerBook File Assistant, you need:

- A PowerBook computer with at least 4MB of RAM
- System software version 7.0 or later
- System software version 7.1 or later is required to link files and folders by dragging them into the synchronization window.
- A hard disk drive

Installing

You install File Assistant software on your hard disk using the Installer. Use Easy Install to install all of the software:

- The PowerBook File Assistant
- The Assistant Tool Box, and
- The system software that lets you drag icons from the Finder to the

PowerBook File Assistant Setup window (requires System 7.1 or later).

Use Customize to select specific items you want to install.

File Assistant: Manual Synchronization (6/93)

Revised: 6/4/93
Security: Everyone

File Assistant: Manual Synchronization (6/93)

==========

Article Created: 7 June 1993

TOPIC ----------

Manual updates allow you to choose when to update a linked pair of items. When you make a change to a file on one disk, the PowerBook File Assistant doesn't update that file on the other disk until you tell it to. This article tells you how to use manual synchronizer with the Synchronizer software of File Assistant.

DISCUSSION ----------

Manually synchronize linked files at any time following these steps:

1) Choose Manual from the Synchronize menu with the pair selected.

2) Click the arrow between the two files in the synchronization window.

3) Continue to click the arrows for all the pairs you want to update.

You can also manually update files that are linked by choosing Synchronize Now from the Synchronize menu with the pair selected.

File Assistant Synchronizer: Types of Updates (6/93)

Revised: 6/4/93
Security: Everyone

File Assistant Synchronizer: Types of Updates (6/93)

==========

Article Created: 7 June 1993

TOPIC

This article tells you what kinds of updates are possible in two linked items, and what action to expect when you make changes in one of the items.

DISCUSSION

There are three kinds of changes you can make to linked items:

- Modify the file or folder.
- Delete the file or folder, or move it to another place on the disk.
- Replace the file with another file of the same name.

When the PowerBook File Assistant notices these changes, it does the following:

- Modify
  - In a two-way link, the unchanged file or folder is updated.
  - In a one-way link, if the arrow points to the unchanged file, the unchanged file is updated. If the arrow points to the changed file, nothing happens.
- Delete
  - In a two-way link, you get a message asking if you want to delete the other item.
  - In a one-way link, if the arrow points to the deleted item, the deleted item is updated. If the arrow points to the undeleted item, you get a message asking if you want it deleted.

Article Created: 7 June 1993
Article Reviewed/Updated 20 July 1995

TOPIC ----------

This article describes these key features of the Synchronizer software that is part of File Assistant:

- Drag and Drop Setup
- Smart Merge
- Optional Automatic Operation
- One and Two Way Links

DISCUSSION ----------

Drag and Drop Setup

The first step in setting up a synchronization environment is to establish the link between the documents. Synchronizer assumes that the pair of files already exist. The internal clocks of the two computers must be set to the same time.

To establish the link, drag the icons directly from the Finder into the Synchronizer window. The Synchronizer makes sure that the files are truly a matching pair (same Name, Type, Creator, and Modification Date) before establishing the link. It can link any two folders, except when one is within the other. It can link folders with different names or containing different files using the "Allow non-matching folder names" choice in the Preferences dialog box.

NOTE: You need system software 7.1 or later to use the Drag and Drop Setup feature.

Smart Merge

Most file synchronization packages merge two folders by copying every file that

is in either folder into the other folder. This has the undesirable side effect of creating folders that grow over time unless you manually delete files on both computers simultaneously.

Smart Merge tracks your folders, and if you make a change to one folder, it makes the same change to the linked folder. If you delete a file on your PowerBook, the Synchronizer merge moves the file on your Macintosh into a "deleted files" folder.

Optional Automatic Operation

Once a link is established, you can synchronize any two files or folders by selecting the Synchronize Now item from the Synchronize Menu or by clicking on the arrow between the two links.

Optionally, you can select automatic linking by selecting the Automatic item when a link is selected in the main Synchronizer window.

The uses of the Automatic attribute increase when combined with AutoRemounter. For example, you can plug a PowerBook 160 into a LocalTalk network, and assume that the files on the PowerBook will be updated without interaction.

One and Two Way Links

Ordinarily, when using Synchronizer to maintain the most current sets of files, it establishes a two-way link. However, in situations where a master file is going to be updated to a network of local and remote users, you can establish one-way links by selecting the link and choosing the appropriate direction. This is also the best way to use Synchronizer when mirroring a computer's hard disk to a backup volume.

File Assistant Synchronizer: Using with Systems Earlier Than 7.1

Revised: 6/10/93
Security: Everyone

File Assistant Synchronizer: Using with Systems Earlier Than 7.1

==========

Article Created: 7 June 1993

TOPIC ----------

This article gives you an alternate procedure to use instead of the "Drag and Drop" set up for establishing a link between two documents for the File Assistant Synchronizer. The Drag and Drop feature isn't available to you with system software earlier than 7.1 installed on your computer.

DISCUSSION ----------

Follow these steps:

1) Click the item selection box to select it.

2) Choose Select An Item To Synchronize from the File Menu.

3) Find the file or folder you want to synchronize.

4) Click Select after highlighting the file or folder you want to synchronize.

5) Click the corresponding item selection box in the selected pair.

6) Repeat steps 2 through 4 to link the matching file or folder.

Performa 405: Upgrading Video Beyond 16 Colors (6/93)

Revised: 6/14/93
Security: Everyone

Performa 405: Upgrading Video Beyond 16 Colors (6/93)

==========

Article Created: 1 June 1993

TOPIC ----------

My new Performa 405 display comes with only 16 colors, making many of the programs I want for my children available only in shades of gray. What's the easiest way to get 256 colors?

DISCUSSION ----------

To get more than 16 colors on the Performa 405, purchase the 512K VRAM SIMM, which gives you the full 256 colors some of your programs need.

To get the VRAM SIMM, contact an Apple service provider. To locate an Apple service provider in your area, call (800) 538-9696 for a referral.

AppleShare 3.0.2 Patch (6/93)

Revised: 6/17/93
Security: Everyone

AppleShare 3.0.2 Patch (6/93)

==========

Article Created: 4 June 1993

TOPIC --

I just got a flyer from Sonic Systems that says Server Sentry is now shipping with the AppleShare 3.0.2 patch. They also included the full May 17th MacWeek article on AppleShare 3.0.2. Does such a patch really exist? Is it only useful for Server Sentry and Server Manager.

DISCUSSION --

AppleShare 3.0.2 is not a shipping product. It is currently under development and will be available in the future. The MacWeek article and the Sonic Systems flyer are incorrect. There is a current AppleShare 3.0.1 patch "3.0.1 rev. B" that is being sent to customers with specific problems. This patch was not fully tested, contains some bugs, and is not generally available.

PowerBook: Power and Battery Saving Tips (2/97)

Revised: 2/28/97
Security: Everyone

PowerBook: Power and Battery Saving Tips (2/97)

==========

Article Created: 7 June 1993
Article Reviewed/Updated: 28 February 1997

TOPIC ----------

This article provides suggestions for reducing power consumption, thus extending the life of your PowerBook computer's battery.

DISCUSSION ----------

General Information

Battery voltage varies by PowerBook model, individual battery type, ambient temperature, and other factors. To check battery voltage, use a voltmeter to determine the actual charge. Battery verification can be found within the PowerBook additional procedures of the Service Source. This is the true hardware check and it is the most accurate and helpful troubleshooting tool.

Another tool, Norton Essentials, is a software utility that can handle some of the following battery conservation tips.

Some load items that affect battery discharge:
• Amount of RAM installed
• Screen brightness
• On time for disk drives
• The PowerBook's operating mode
• Peripherals (including internal modem)

The Tech Info Library contains several other articles with further details on batteries, utility software, and other related topics.

Before Using Your PowerBook

• Shut down your PowerBook and charge its battery overnight. This ensures that the battery becomes fully charged.

• Reduce the number of extensions and control panels that load by using an extension manager program.

Settings and Controls

• Turn down the brightness.

• Turn Backlighting down to minimum. Set the shortest delay before dimming (move the slider in the PowerBook Display control panel to the left). Use this dimming feature instead of a screen saver program. Screen savers access the hard drive and keep backlighting turned on (which uses battery power) but dimming does not.

• In bright light, you can even turn backlighting off, greatly increasing battery life. Some people use a booklight with no backlighting, but this is an extra gadget to carry. Also, the PowerBook File Assistant software offers the PowerBook Display control panel that provides controls over automatic screen dimming.

• Avoid desktop patterns with many black pixels or solid dark areas. (These don't consume more power, but they tend to make you turn up the backlighting, which does consume more power. For Color displays it is good to use darker colors, like black, that reduce the use of Red, Green, or Blue pixels. All pixels On make white.

• Use Chooser to turn off AppleTalk. This saves power and lets the PowerBook wake up faster. You may wish to have AppleTalk turned on when you restart and then turn it off. That way you can turn AppleTalk on and off without restarting. If AppleTalk is turned off when you start up a computer, certain system code doesn't get loaded, and a restart is necessary to get it loaded again. If you have the PowerBook File Assistant Toolkit extension installed, AppleTalk is always available, thus avoiding the need to restart the system to load the AppleTalk drivers.

• Turn the sleep wait period down to a minimum using the PowerBook control panel, or set the Battery Conservation slide control to Maximum Conservation in the PowerBook control panel.

• Set system and hard disk sleep to their minimum settings.

• Select Reduced Speed in the Battery Conservation Options section of the PowerBook control panel.

• Use Sleep in the Special menu, or the Battery desk accessory, as often as practical. If the PowerBook File Assistant is installed, you can also use the Sleep Fkey sequence, Shift-Command-0.

• Unless you have a RAM disk you want to preserve, select Shut Down rather than Sleep when you won't be using the computer for more than 30 minutes. Note: This does not apply to the PowerBook 100, whose RAM disk is preserved after shut-down.

• Enable "Allow Processor Cycling" to reduce the power draw of the

microprocessor.

Using Memory

• Use the Memory control panel to set up a RAM disk. Use the Installer to create a minimal System Folder on the RAM disk, and then use it as the startup disk.

WARNING: Except in the PowerBook 100, the contents of a RAM disk are lost when you shut down a PowerBook. In other models, use Sleep to preserve RAM disk contents, or use the Persistent RAM disk feature of the PowerBook File Assistant software.

The Tech Info Library article "PowerBook: Setting Up to Run from a RAM Disk (6/93)" documents how to set up a RAM disk for your PowerBook.

• Use the Memory control panel to turn off Virtual Memory.

• Use third-party RAM cards that contain low-power RAM chips.

Application Software

• Under battery power, don't use applications or features (such as spell checking or QuickTime) that require lots of hard drive access.

• Instead of a full-featured word processor, use TeachText, AppleLink, or a program designed specifically for PowerBooks. Many word processors constantly access the hard drive, which uses battery power.

• When you're near an AC outlet, and you're planning to use battery power later, launch your applications and open data files with AC power, then put the PowerBook to sleep. Your work will be in RAM when you come out of sleep.

Using Peripherals

• Quit any program that uses a modem as soon as you're finished with it.

• Turn off features such as "wake on ring" and "fax receive" for modems.

• Don't use external devices when operating the PowerBook from battery power.

• If any SCSI devices are connected to the computer, make sure they're turned on, even when you're using the AC adapter. Power can drain from your battery through attached power supplies.

• Use the disk drive as little as possible and eject any floppy disks you're not using.

• Use only low-power ADB devices that are designed for PowerBooks.

• Remove any PC (PCMCIA) cards from the PC card expansion slot(s). Some cards

draw power even when they are not in use. (NOTE: Not all PowerBook computers have PC slots. If you're not sure if your's does, you should check the manual.)

Other Tips

- If you're near an electrical outlet, use the AC adapter.

- Travel with a spare battery.

- Regularly "Exercise" the Battery. Warning: this tip does not apply to the PowerBook 100, whose lead-acid battery should not be fully discharged.

To maximize battery life, discharge them completely once every 90 days. Just use the computer as you normally would, but ignore the low-power messages that appear on the screen (make sure to save your work). When the computer goes to sleep automatically, recharge the battery completely before using that battery again.

SNA•ps 5250: Gateway Computer Performance (5/93)

Revised: 6/4/93
Security: Everyone

SNA•ps 5250: Gateway Computer Performance (5/93)

==========

Article Created: 14 May 1993

TOPIC ----------

Does the speed of the computer that serves as the gateway have an effect on performance or is all the communication taking place on the NuBus card?

DISCUSSION ----------

The speed of the gateway code running on the NuBus card is not affected by the speed of the Macintosh it is installed in. Our gateways run about the same performance in the Quadra 950 as a Macintosh II. There are some issues with multiple NuBus cards in a multi-slot Macintosh and having all the AppleTalk Client traffic running out a single Ethernet card or Token Ring card, for example. Now the speed of processes across the NuBus becomes a factor. If the Ethernet card is dumb, then the AppleTalk conversions are done in the Macintosh and distribution of session data may be delayed. In a single gateway environment, this is not an issue unless you are running say an AppleShare server on the same Macintosh as the SNA•ps Gateway. We have had reported problems with two very high traffic oriented services in the same Macintosh overrunning the Ethernet or Token Ring cards, resulting in very slow performance or freezes. These type of problems are being addressed in future releases of NSI. So to summarize, a single SNA•ps gateway running in a Macintosh will operate about the same in all NuBus Macintoshes. Add more processes which start to stress the AppleTalk distribution and slow downs are possible.

PowerBook: Setting Up to Run from a RAM Disk (9/94)

Revised: 9/29/94
Security: Everyone

PowerBook: Setting Up to Run from a RAM Disk (9/94)

==========

Article Created: 7 June 1993
Article Reviewed/Updated: 29 September 1994

TOPIC ----------

This article tells you how to set up a PowerBook RAM disk for efficient use of your PowerBook.

DISCUSSION ----------

1) Make sure that you have about 10MB of free space on the PowerBook hard disk (install space), and also about 3MB to 4MB as permanent backup for the RAM disk. Have a current System Folder already installed on your internal hard disk.

2) It's best to have a full 8MB of RAM in your PowerBook. You can use a RAM disk with 6MB, but it's usually too awkward.

3) Use the Memory control panel to create a 4MB RAM disk. Later, you should increase or decrease the RAM disk size depending on your particular circumstances. The trade-off is between the size of the RAM disk and the amount of memory remaining to run system software and applications. A 3.2MB RAM disk seems to be optimal.

4) Install a minimal system on the RAM Disk with your System installation disks.

5) Copy selected items manually back into your System Folder. These items are optional. The more that you copy back, of course, the less space is available on your RAM disk for applications and documents. The objective is to get everything you need onto the RAM disk and avoid powering up the hard disk. You will need to fine-tune your setup to suit your circumstances. You'll at least want to copy back Chooser, Startup Device, Portable or PowerBook, and Battery.

   Examples of what you might copy to the RAM disk System Folder include:

Alarm Clock, LaserWriter, Memory, AppleShare (not File Sharing), and a few fonts. Additional third-party items are: SAM Intercept, SCSI Probe, and the PowerBook File Assistant's Assistant Toolkit extension.

6) Select up to three applications you want to put on the RAM disk. Keep only the application and the accessory files you really need.

7) Leave at least 200K to 300K free for documents and other files. Even better is 400K to 500K, because things like Preference files and other items often take additional space.

8) Once your RAM disk is completely configured, drag the RAM Disk icon over your internal hard disk icon. This creates a folder on your hard disk called "RAM Disk." This copy will serve as a backup of your RAM Disk. Periodically copy the RAM disk to the hard disk when the RAM disk changes.

   If you ever totally lose power, you can quickly restore your RAM Disk by dragging the contents of the RAM Disk folder to a new, but empty, RAM Disk. Frequently back up your RAM disk to your hard disk because you may be continually optimizing it at first. It takes only a few seconds to copy the entire RAM disk to the hard disk, replacing the existing folder.

   NOTE: Having multiple System Folders on your hard disk isn't generally recommended, and System Picker (a utility that allows you to select among System Folders on the same hard disk) may prove useful.

9) In addition, regularly copy documents in progress to the hard disk as a backup. This takes only a second, and the hard disk doesn't stay powered very long. Just after doing such a copy, put the PowerBook to sleep with the Sleep Fkey (available as part of the PowerBook File Assistant software), and then rewake it just so the hard disk will sleep sooner.

10) Leave your PowerBook in sleep mode all the time so that the RAM disk is always around and ready to run. Shutting down erases the RAM disk on many of the PowerBook models. Restarting is OK.

    NOTE: The Persistent RAM disk feature of PowerBook File Assistant software allows information in the RAM disk to be saved between restarts and shutdowns.

    If you switch batteries while your PowerBook is asleep, MAKE SURE THE POWERBOOK IS PLUGGED IN AND GETTING POWER, otherwise your RAM disk will be erased! When on the road and far from a power outlet, back up your entire RAM disk to the hard disk when the first or second (not the third and final!) battery warning comes on. Then shut down, switch the batteries, reboot, copy the RAM disk contents back, and continue computing.

    The RAM disk on the PowerBook 100 survives shutdowns and you can switch the main battery while in sleep mode without the power supply

plugged in, since the 100 has a secondary set of batteries. There's a slight battery drain when in sleep, but a PowerBook seems to be able to last a few weeks in sleep mode.

11) If your PowerBook crashes, use a paper clip to push to the restart button. The RAM disk will usually be intact if you do this. You can use the on/off button to restart the crashed PowerBook if you don't mind losing the contents of your RAM disk and recreating it from your hard disk copy.

12) Use the Startup Device control panel to select which disk to start from (RAM Disk or internal hard disk). Switch between running the System Folder on the hard disk and the minimal System on the RAM disk. Use the RAM disk just when you want to be power conscious.

13) Put your PowerBook to sleep whenever possible. From the Battery control panel of Special menu you can put the PowerBook to sleep. If you have the PowerBook File Assistant installed, use the Sleep Fkey (Shift-Command-0) to instantly put the PowerBook to sleep whenever needed (no need to switch to Finder and select Sleep). Wakeup is instantaneous if you have AppleTalk turned off and are running from a RAM disk.

PowerBook Duo: Sliding Switch on Battery (6/93)

Revised: 7/7/94
Security: Everyone

PowerBook Duo: Sliding Switch on Battery (6/93)

==========

Article Created: 1 June 1993

TOPIC -----

What is the sliding switch on the side of the PowerBook Duo battery? When it is slid one way, an icon of a full battery shows. When the switch is slid the other way, an empty battery icon is revealed.

DISCUSSION -----

The slider on the left side of the PowerBook Duo battery, visible only when the battery is removed from the PowerBook Duo, is a convenience for the user:

- After charging a battery, the user may slide the switch to indicate that the battery is fully charged.
- When a depleted battery is removed from the PowerBook Duo, the user may slide the switch to show that the battery needs a charge.

When using multiple batteries, this avoids confusion and shows at a glance which batteries are charged and which need to be recharged.

The position of this switch does not affect actual usage of the battery in the PowerBook Duo, and it does not slide automatically; it is merely an indicator for the user, set by the user.

Performa 405: Losing Colors in the Finder (7/93)

Revised: 7/16/93
Security: Everyone

Performa 405: Losing Colors in the Finder (7/93)

==========

Article Created: 2 June 1993
Article Reviewed/Updated: 8 July 1993

TOPIC ----------

Sometimes when I look at the built-in desktop patterns in the General control panel of my Performa 405, the patterns are entirely in gray. At other times the patterns have some color.

Also, sometimes the icons on my Performa 405 are in black and white. I have colors in other places on my desktop, but not in any of my icons.

DISCUSSION ----------

The Performa 405 (like the Macintosh LC II) comes from the factory with 256K of VRAM installed, which allows it to display a maximum of 16 colors at one time. This doesn't mean that it has an absolute set of only 16 colors to choose from; rather, it has millions of colors to choose from, but can display only 16 of them at once. The System polls all color resources of the items being displayed and tries to pick a set of 16 colors that will work as a happy medium. Colors not picked as one of those 16 get displayed as gray.

Some colors have precedence and cannot be bumped. The highlight and window colors (those set in the Color control panel) cannot be bumped from the list of 16 while the Finder is active.

As for the icons, you may have assigned not only highlight and window colors, but labels as well. Each of these choices locks up one of the 16 possible colors. After you assign more than two or three labels, the icons shift from color to black and white.

When an application, extension or control panel takes away colors from the Finder, the Finder tries to replace the colors. Unfortunately, the Finder is not intelligent about this. A "used" color is no longer available to the Finder. This is very noticeable in 4-bit mode, 16 colors. When the Finder doesn't have enough choices, it often defaults to black and white until the

colors are given back. Restarting the computer is one of the actions that restores the colors. It may also be necessary to restore the label colors to their original values. Search on label colors for an article with more information.

The shift to black and white can be accelerated by assigning highlight, window, and labels to different shades of the same color. This assignment reduces the range of colors available as well as the total number, causing the Performa 405 to drop into black and white icons sooner.

The loss of colors can be conclusively identified by a solid black apple over the Apple menu. For copyright reasons, the apple must appear with certain colors. If the system cannot find even one of the six colors, it displays the logo in black rather than making one or more of the color stripes gray. More colors can be freed up by using the color wheel to set all the label colors to black (open the Labels Control Panel to access this). Setting highlight and window colors to black and white (in the Color control panel) should free the maximum number of colors. If you set all the labels to black and white, but the black and white icons remain, try restarting the computer.

To increase the number of colors to 256, you need to install the 512K VRAM SIMM. Contact your local Apple authorized dealer for further details.

LaserWriter IIf/IIg: Downloading Files From Hard Drive (6/93)

Revised: 6/10/93
Security: Everyone

LaserWriter IIf/IIg: Downloading Files From Hard Drive (6/93)

==========

Article Created: 8 June 1993

TOPIC ----------

One of the benefits of the LaserWriter IIf/IIg is connecting an external hard drive which gives one the ability to store "background art" at the printer. No details are given in the Owner's Manual as how to download files or how these files are called upon when printing.

DISCUSSION ----------

To utilize this feature of storing and downloading files from a hard drive requires fairly good knowledge of PostScript.

The only way of storing "background art" on a printer's hard disk is through writing (then downloading) PostScript code to access the PostScript file system, along with writing the PostScript code required for the art.

AppleDesign Powered Speaker: Additional Specifications (5/93)

Revised: 6/8/93
Security: Everyone

AppleDesign Powered Speaker: Additional Specifications (5/93)

==========

Article Created: 1 June 1993

TOPIC ----------

This article addresses specific technical questions on the AppleDesign Powered Speakers.

DISCUSSION ----------

Q. What type of shielding do the AppleDesign Powered Speakers have?
A. The speakers are fully shielded magnetically to avoid display distortion if used near a computer monitor.

Q. What is the Amp classification? (A, B, C, AB, and so forth.)
A. The amp classification is Class B.

Q. What is the frequency response?
A. Apple suggests listening to the speakers relative to others, it is much more meaningful. The frequency response is: 90-17,000 Hz (+/- 3dB), which is actually quite good for a small and light speaker.

Q. What are the pinouts of the AppleDesign Powered Speakers?
A. 1 - Computer input jack: (standard 3.5mm mini-stereo phono plug) Sleeve=GND, Ring=Right, Tip=Left
1 - CD stereo input jack (dual RCA jacks: left and right)
1 - Speaker to speaker jack (pull-down terminals for stripped and tinned wire)
1 - Front panel headphone jack (3.5mm miniplug, like a computer input jack)

At Ease 1.0: Shut Down Button is Finder from Oregon Trail Game

Revised: 8/8/95
Security: Everyone

At Ease 1.0: Shut Down Button is Finder from Oregon Trail Game

==========

Article Created: 7 June 1993
Article Reviewed/Updated: 08 August 1995

TOPIC ----------

I have a button in the Applications panel of At Ease that looks like a light switch. Whenever I click on the button, the computer shuts down. If I reinstall At Ease, the button may disappear. What is it?

DISCUSSION ----------

The button is an alias for a rewritten Finder that can only shut down a Macintosh.

The game, Oregon Trail, comes with one disk meant to be a bootable disk for systems with no hard drive. Because of space limitations on the floppy disk, both the System and the Finder are severely altered. The only function left in the altered Finder is shutting down the Macintosh.

The Oregon Trail manual says to delete the System Folder after copying the bootable disk to the hard drive. Users sometimes ignore this step. Since the modified Finder's file type is Application, At Ease can add this Finder as a button in the Applications panel when told to "Gather Applications." Clicking the button launches the modified Finder, which shuts the system down.

If you have the light switch button, remove the duplicate System Folder. The System Folder will be on the Macintosh hard disk in a folder called, "Oregon Trail." The Finder may look like a normal Finder icon or a light switch icon. You can conclusively identify it by its version string: "1.0a1 NEC Shutdown Finder."

Sometimes, At Ease can't make a button for the altered Finder. If you reinstall At Ease or remove the altered Finder from At Ease, the button may not reappear after another Gather Application command.

A/ROSE: Description (3/95)

Revised: 3/22/95
Security: Everyone

A/ROSE: Description (3/95)

==========

Article Created: 7 June 1993
Article Reviewed/Updated: 22 March 1995

TOPIC -----

What's A/ROSE? The extension is on my computer. Do I need it?

DISCUSSION -----

A/ROSE stands for Apple Real-Time Operating System Environment. It's a system extension that allows communication between the Macintosh main logic board and Macintosh Coprocessor Platform (MCP) based NuBus cards which run the Apple Real-Time Operating System. This means that specific Macintosh NuBus cards, such as the Apple Token Ring cards and the Apple Ethernet NB card, have their own 68000 chip on board.

A/ROSE runs as a driver under the standard Macintosh operating system. It downloads, starts, stops, sets priorities, and communicates with real-time processes that run on any A/ROSE compatible NuBus card.

The only reason to install this extension is to support an MCP-based card. If it's on a PowerBook Duo, it could be that the Duo Dock has an Ethernet NB card installed. When not docked, A/ROSE still loads, but the Duo doesn't use it. Other cards that require A/ROSE include the two Apple Token Ring, the Serial NB, and the Apple Coax/TwinAx NB cards. Note that SNA•ps is a software product which may require A/ROSE in specific configurations. Macintosh computers with built-in Ethernet don't need A/ROSE, and as far as we know, non-Apple Ethernet cards don't use A/ROSE.

Article Change History:
22 Mar 1995 - Corrected wording of Duo Dock.

AppleTalk Zone Information Protocol Query (6/93)

Revised: 6/17/93
Security: Everyone

AppleTalk Zone Information Protocol Query (6/93)

==========

Article Created: 8 June 1993

TOPIC -----

I have an AppleTalk protocol question and need help. Here are the requested sniffer traces. There are two vendors in consideration here. One vendor makes an AppleTalk network management package which runs on my Sun workstation. The other vendor is Wellfleet (WF) which makes our backbone routers.

The Network Management Vendor (NMV) creates a Zone Information Protocol (ZIP) query with the count indicated and expects the FIRST packet received from the AppleTalk router to contain a network count reflecting the TOTAL number of replies. In other words, if the WF router intends to reply with 50 networks then packet number '2' below should have a network count of 50, not one.

- Note that the term 'network' refers to an AppleTalk network described by an AppleTalk network number and delimited by AppleTalk routers. An extended network may have multiple zones.

The Wellfleet router says the network count in packet two indicates the number of networks contained in that packet only.

The net effect is the NMV only see's one ZIP reply per ZIP query because the WF put's a count of 'one' in the first packet.

I need from Apple an answer to the question: Given the ZIP query in packet (frame) number 1, what should the network counts in each of the subsequent reply packets be? What should these packets contain? I'm mostly concerned with extended networks.

A summary sniffer trace is as follows. Please note that the line length is longer than 80 chars and may not show up clearly on your screen.

```

DISCUSSION -------------------------------------------------

This behavior from the Wellfleet routers is perfectly correct and
acceptable.  I understand why there may be some confusion concerning this
so I'll attempt to clarify this for you.

There are two types of ZIP query reply packets, extended and non-extended.
I'll summarize the differences below.
```

Non-extended ZIP reply:
  Rules:
  - ZIP function type = 2
  - Multiple networks can be included in a single response packet, provided that an entry is completely contained within the packet.
  - The network count field is equal to the number of network/zone pairs included in the packet.
  - Extended and non-extended network mapping can be mixed in a single reply packet.
  - The network number field for extended networks is set to the first network number in the range. For example network 1000-2000 would be resolved using network number 1000 for all zone name mapping.

Extended ZIP reply:
  Rules:
  - ZIP function type = 6
  - Limited to a single network/zone mapping per packet.
  - The response to the query may not fit in one packet and hence is allowed to transverse multiple packets.
  - The network number field has a new meaning. It now represents the total number of zones being returned for the given network. This number will be the same in each packet returned for the network being queried.
  - A router can return an extended reply even if the response will fit in a single packet. In this case the response is limited to a single network per packet.

This last rule in the "extended ZIP rules" is the rule the Wellfleet is using in its response to the query from the network management station. Given this information I think you can now easily work through the vendor of the network management application to resolve this problem.

Language Kit Installers: Crash in 24-bit (2/95)

Revised: 2/17/95
Security: Everyone

Language Kit Installers: Crash in 24-bit (2/95)

==========

Article Created: 10 June 1993
Article Reviewed/Updated: 17 February 1995

TOPIC ----------

If I install one of the Language Kits (with 24-bit addressing ON), the Installer crashes while merging the TrueType fonts. This ONLY happens when installing on Macintosh computers with non 32-bit clean ROMs (Macintosh II, IIx, SE/30, IIcx) that also have the 32-bit System Enabler installed.

Installing with 32-bit addressing turned ON has no problems.

DISCUSSION ----------

This problem has been duplicated and reported to Apple engineering. The only workaround at this time is to turn ON 32-bit addressing while installing the Language Kits with these types of Macintosh computers, (Macintosh II, IIx, SE/30, IIcx) that have the 32-bit System Enabler installed.

Article Change History:
17 Feb 1995 - Updated to include both Language Kits.

LaserWriter Pro: Darker Courier Font (2/97)

Revised: 2/26/97
Security: Everyone

LaserWriter Pro: Darker Courier Font (2/97)

==========

Article Created: 10 June 1993
Article Reviewed/Updated: 26 February 1997

TOPIC ----------

When we print Courier on our LaserWriter Pro 630, the font comes out lighter looking than previous LaserWriter printers we've owned. I have heard of a new "darker" version of the Courier font for the LaserWriter Pro printers. How can we obtain it?

Also, since Courier is the default font in HP PCL mode and we're using PC compatible computers, is there a way to download the font from our PC compatibles?

DISCUSSION ----------

Previously there was a "darker" version of the Courier font available that could be downloaded to the LaserWriter Pro 600 or LaserWriter Pro 630 printers using the Apple Printer Utility. Now there is a better solution. You should download the Courier TrueType font from a Macintosh (in your System Folder:Fonts) to the printer. Once downloaded, the printer uses that font in printer RAM instead of the lighter version of the font in ROM. The font remains resident in printer memory until the printer is power cycled (powered off, then back on). If this occurs you must download the font again.

Unfortunately, we are unaware of a way to download the font using PC compatible computers. The only workaround is to use a Macintosh to download the font using the Apple Printer Utility.

This article appeared in the 27 February 1997 issue of the Information Alley.

Article Change History:
26 Feb 1997 - Updated entire contents, changed distribution.
23 Dec 1993 - Revised article.
19 Jul 1993 - Change the release date of the ROM.

DAL: Work With Microsoft Open EIS Pak (6/93)

Revised: 6/17/93
Security: Everyone

DAL: Work With Microsoft Open EIS Pak (6/93)

==========

Article Created: 10 June 1993

TOPIC ----------

Is there information on Microsoft Open EIS Pak, and does it work with DAL?

DISCUSSION ----------

Yes, Microsoft Open EIS Pak will work with DAL since it supports all Excel functions including Data Access Manager.

We found some information regarding Microsoft Open EIS Pak for the Macintosh in MacWeek Jan 11, 1993. This is a set of Excel-based development tools that aims to help users create corporate information systems based on an Excel spreadsheet, without writing code.

The package includes a variety of tools for creating custom menus, user-prompt dialogs, navigation controls and links to other applications. This package is nearly identical to the Windows version released last November 1992.

Microsoft Open EIS Pak for the Macintosh requires Excel. It will support all Excel functions, including charting and graphing, as well as System 7 features such as publish and subscribe, Apple events, and the Data Access Manager.

A/UX 3.0: Problem With The ruserpass (6/93)

==========

Article Created: 10 June 1993

TOPIC ----------

I am working on getting one of my UNIX applications to compile and execute under A/UX. Currently, I'm running into compile errors. This software has been compiled on a Sun workstation successfully.

I looked around inside "libc.a" and found that the "ruserpass" symbol is being referenced in the object file, "rexec.o" in the C library. The "pvm3" (their software) package does call the "rexec()" function, which, I believe, references the "ruserpass" symbol. This symbol does not seem to get defined properly in the C runtime library.

Below is a copy of the compile session:

```
making in AUX/ for AUX
       cc -g -DARCHCLASS=\"AUX\" -DIMA_AUX -DSYSVSIGNAL -o pvmd3 archcode.o
              cruft.o databuf.o ddpro.o frag.o host.o logging.o mesg.o
              myalloc.o nmdclass.o pkt.o pkup.o pvmd.o startup.o task.o
              tdpro.o waitc.o imalloc.o

undefined               first referenced
 symbol                     in file
ruserpass               /lib/libc.a

ld fatal: Symbol referencing errors. No output written to pvmd3
Make: *** Error: Update of `pvmd3' terminated with exit code 13
Make:            [line 47 in /homeb/bpowell/pvm3/src/AUX/Makefile]
```

DISCUSSION ----------

Your indication on the problem is correct, there is a problem with the rexec() function that references ruserpass, which doesn't exist.

The problem exists in the A/UX 3.0-CD distribution, fortunately, the problem was found before A/UX 3.0 went out of door. The fix for this is included in the "A/UX 3.0 Read Me" floppy disk, which includes the ruserpass.o module to be updated with libc.a. Here are the instruction from the Read Me file:

1) Insert the Read Me disk into your system and open the LIBC folder.

2) Drag "xdr.o", "ruserpass.o", and "xdr.h" to the "/tmp" folder on your root volume.

3) Enter these commands:

```
cd /tmp
ar r /lib/libc.a ruserpass.o xdr.o
mv xdr.h /usr/include/rpc/xdr.h
```

Personal LaserWriter 300: Description (6/93)

Revised: 6/11/93
Security: Everyone

Personal LaserWriter 300: Description (6/93)

==========

Article Created: 14 June 1993

TOPIC

This article describes the Personal LaserWriter 300 printer.

DISCUSSION

The Personal LaserWriter 300 represents Apple’s entry level laser printer and is based on a new, compact Canon 4 page per minute (ppm) xerographic engine. It features improved print quality, an energy saving design, and the ability to share the printer with other users connected to the network.

The printer features GrayShare driver software, an innovative new technology that gives you the ability to share your printer with others across a network. When the printer is connected to a single Macintosh via a serial cable, the GrayShare software driver architecture allows anyone connected to the host Macintosh (using LocalTalk) to print to it.

To simplify printing while maximizing flexibility, the printer uses a 100-sheet Universal cassette tray that supports a variety of paper sizes (U.S. Letter, U.S. Legal, A4, B5, and Executive) and a single sheet manual feed tray.

The Personal LaserWriter 300 is equipped with an automatic on/off feature that conserves energy by keeping the printer in a standby state when not in use. When a document is ready to be printed, the Personal LaserWriter 300 automatically powers up.

FEATURES

Print quality

- 300 dots-per-inch (dpi) resolution
- Grayscale printing for sharp graphics
- 39 scalable TrueType fonts for printing a wide range of styles and sizes

Flexible paper handling

- 100-sheet Universal cassette supports a variety of paper sizes
- Manual feed tray included for printing envelopes and other types of media
- Straight paper path for printing on heavy stock, also minimizes envelope curling

Memory

- Standard 512K of RAM with compression
- Up to 2.5 MB virtual RAM buffer using Apple custom compression algorithms

Interface

- High-speed RS-422 serial interface

Print speed

- Four pages per minute maximum (actual speed varies depending on images printed and computer used)

System requirements

- Any Apple Macintosh personal computer with at least 1 MB of RAM and a hard disk drive
- System software version 6.0.7 or later
- Recommended: 4 MB of RAM or more with System software version 7 or later

Energy efficiency

- Uses minimal power when printing
- Automatic on/off feature conserves energy

Convenience

- Weighs only 15 lbs.
- Easy, one-click installation
- Compact desktop design (about the size of a Macintosh IIci)

Ordering Information

Apple Personal LaserWriter 300
Order No. M2047LL/A

- Apple Personal LaserWriter 300 printer
- Toner cartridge
- Installation software and fonts disks
- Interface cable
- User’s Guide
- Limited warranty statement
- 100-sheet Universal cassette tray

Apple Personal LaserWriter 300 100-Sheet Universal Cassette
(supports A4, U.S. Letter, U.S. Legal, and Executive paper sizes)

Personal LaserWriter 300: Specifications (1/96)

==========

Article Created: 14 June 1993
Article Reviewed/Updated: 16 January 1996

TOPIC----------

This article gives the technical specifications for the Apple Personal LaserWriter 300.

DISCUSSION ----------

Marking engine

Canon engine

Controller

Application-Specific Integrated Circuit (ASIC) controller

Print Quality
---
300 dpi for text and graphics

Speed
---
4 pages per minute maximum. Actual speed depends on the images being printed and the computer being used.

System requirements

- Any Apple Macintosh personal computer with at least 1 MB of RAM and a hard disk drive
- System software version 6.0.7 or later
- Recommended: 4 MB of RAM or more with System software version 7 or later

Memory

```
------
512KB of RAM (no memory upgrades available)

Interfaces
----------
8-pin serial port @ 769 Kbits/second, externally clocked

Imageable Area (Minimum Margins)
--------------------------------
Maximum printable line: 208 mm (8.19 in.)
Minimum top margin: 3.6 mm (0.14 in.)
Minimum bottom margin: 6.35 mm (0.25 in.)
Minimum left margin: 3.2 mm (0.12 in.)
Minimum right margin: 5.3 mm (0.20 in.)

Actual imageable area may vary depending on the application program.
The printer senses the cassette size and adjusts to maintain these
margins.

Paper Sizes
-----------
Width:  Minimum - 90mm   (3.54 in)   Maximum - 216mm (8.5 in)
Length: Minimum - 188mm  (7.40 in)   Maximum - 356mm (14.0 in)

Fonts
-----
39 TrueType fonts from the following font families: Helvetica (4 typefaces),
Times (4 typefaces), Courier (4 typefaces), Chicago, Geneva, Symbol, New York,
Monaco, Bookman (4 typefaces), Avant Garde (4 typefaces), Palatino (4
typefaces), Zapf Chancery, Zapf Dingbats, Helvetica Narrow (4 typefaces), New
Century Schoolbook (4 typefaces)

Dimensions
----------
Height: 16.1 cm (6.3")
Width: 38.5 cm (15.2")
Depth (paper tray closed): 37.9 cm (14.9")

Weight
------
Approximately 15.4 pounds (7 kg)

Recommended Duty Cycle
----------------------
8,000 copies per month

Toner Cartridge Life
--------------------
3,000 pages at 4% coverage

Operating Environment
---------------------
Temperature: 10 to 33 deg. C (50 to 90 deg. F)
```

Humidity: 20% to 80%, noncondensing
Toner cartridge transit environment: -20 to 40 deg. C (-4 to 104 deg. F)

Input Electrical Requirements

U.S./Japan: 100 -115 V (+ or - 10%), 50-60 Hz (+ or - 2 Hz)
Europe/Australia: 220-240 V (+ or - 10%), 50 Hz (+ or - 2 Hz)

Power Consumption

Standby: 5 watt hours maximum
Printing: 120 watts average at 115 V
360 watts maximum at 220 V (operating)

Paper Capacity

100-sheet universal cassette
Single sheet manual feed tray

Media Size

Universal cassette feed - Letter, Legal, A4, B5, Executive
Manual feed - Envelope - Legal (single sheet)

Print Materials

Universal cassette feed
- Type: Plain paper
- Weight: 16 - 24 lb.
Manual feed
- Type: Plain, transparency, label, envelope
- Weight: Paper - 16 - 28 lb,
- Weight: Envelope - 28 lb. maximum

Media Output

Single output tray
Capacity - 100 sheets face down

Article Change History:
16 Jan 1996 - Added System requirements.
20 Mar 1995 - Added paper sizes.

Personal LaserWriter 300: Indicator Lights (LEDs)

==========

Article Created: 14 June 1993

TOPIC----------

What are the functions of the indicator lights on the Personal LaserWriter 300 printer?

DISCUSSION ----------

COLOR	NAME	FUNCTION
GREEN	Ready/In Use	ON when the printer is ready to Print. FLASHES while the controller is preparing data for printing. OFF when the printer is not powered on.
AMBER	Paper Out	ON when printer status indicates paper out in CASSETTE FEED mode or MULTI-PURPOSE TRAY mode. OFF otherwise
AMBER	Paper Jam	ON when printer status indicates paper jam

Security: Everyone

Personal LaserWriter 300: Pinouts (6/93)

==========

Article Created: 14 June 1993

TOPIC ----------

This article provides the pinouts for the Personal LaserWriter 300 Mini DIN-8 Serial Connector.

DISCUSSION ----------

Pin	Signal	Description
1	CLK	Receive and Transmit data clock (output)
2	NC	No Connection
3	TxD-	Transmit Data (output)
4	SG	Signal Ground
5	RxD-	Receive Data (input)
6	TxD+	Balanced transmit (output)
7	Vcc	+5 VDC regulated, 300 mA max (output)
8	RxD+	Balanced receive (input)
Shield	PG	Protective Ground

MacX.400: Description (6/93)

Revised: 6/11/93
Security: Everyone

MacX.400: Description (6/93)

==========

Article Created: 13 June 1993

TOPIC ----------

This article describes the MacX.400 products release in June, 1993.

DISCUSSION ----------

Apple's two new X.400 products: MacX.400 v.1.1 and MacX.400 SD make it possible for Macintosh users to send messages over the Internet and other network environments. Both come with easy to use configuration and administration applications. The v.1.1 product supports large installations with multiple servers, while the SD (for "Small Domain") product is for single-server work groups.

MacX.400 transforms a Macintosh computer into a Message Transfer Agent (MTA) that supports X.400 messaging standards. With MacX running, you can exchange E-mail across any platforms and e-mail systems connected by X.400 networks. When working with an E-mail gateway, MacX.400 can distrubiute X.400 services across an AppleTalk network to everyone in an E-mail workgroup.

MacX.400 supports both TCP/IP and Open Systems Interconnection (OSI) transports. You can also use X.25 and Ethernet (IEEE 802.3) as an underlying network. MacX.400 also conforms with US and European X.400 profiles for interoperation with numerous other X.400 servers and vendors.

Other connectivity features include:

• Routing on any standard X.400 address attribute

• Support for multiple types of X.400 body parts, so you can exchange binary attachments, ODA documents, and Macintosh files.

• End System to Intermediate System (ES-IS) routing protocol support to register OSI addressing information autoamtically

• Easy to use X.400 API (Application Program Interface) for quick implementation of X.400 applications on the Macintosh computer. This makes it easy for developers to create X.400 gateways to existing E-mail systems. You can also develop native X.400 user agents for the Macintosh.

A/UX 3.0.1: Description (6/93)

Revised: 6/11/93
Security: Everyone

A/UX 3.0.1: Description (6/93)

==========

Article Created: 11 June 1993

TOPIC ----------

This article describes the A/UX 3.0.1 product.

DISCUSSION ----------

The A/UX 3.0.1 offers the same features as A/UX 3.0 with the addition of asynchronous I/O, multibus SCSI (supported on the Quadra 900, Quadra 950, and Workgroup Server 95) and SCSI DMA driver support (requires additional hardware). A/UX continues to support AppleTalk and TCP/IP networking protocols. The System 7.0 user interface implemented on A/UX 3.0.1 makes it easy to install, use, and manage.

System requirements for A/UX 3.0.1 include a minimum of 8MB RAM. Compatible systems include are Macintosh SE/30, IIx, IIsi, IIcx, IIci, IIfx, Macintosh II (with PMMU upgrade), Macintosh Centris 650 (with FPU), and Macintosh Quadra 700, 800, 900, and 950. (Note: The Centris 610 is supported if it has an FPU; if it lacks an FPU, you need to seek out a third-party upgrade.)

A/UX 3.0.1 also requires at least an 80MB hard disk (160MB or larger recommended for full installation) and an AppleCD SC, AppleCD SC Plus, AppleCD 150, AppleCD 300, or equivalent to install A/UX

Kernel

- AT&T UNIX System V, Release 2, Version 2 with 32-bit addressing, demand-paged virtual memory architecture, pre-emptive scheduling, interprocess communication

- BSD 4.3 extensions including signals, job control, sockets, Berkeley

networking and fast filesystem (UFS)

• Support for SCSI DMA, multiple SCSI buses, and asynchronous input/output

Toolbox

• Macintosh System 7.0.1, optimized for UNIX

• Features: TrueType, AppleEvents & PPC, 32-bit QuickDraw, Balloon Help, Data Access Manager, Aliases, 24-bit and 32-bit addressing

• A/UX File Manager supports transparent access to Macintosh and UNIX filesystems, full asynchronous I/O, and ability to concurrently open up to 5000 files

• A/UX Finder for organizing and locating information on UNIX and Macintosh filesystems

• QuickTime 1.5

Networking and Collaboration

• Berkeley TCP/IP protocol stack and commands, including Telnet, FTP, rlogin, rcp, and remsh

• CSL/IP

• NFS 4.1 and NIS

• AppleTalk protocol stack, including ADSP and AFP

• AppleEvents, AppleShare client, and FileSharing

• MacTCP 1.1 provides interface to kernel TCP/IP services for Macintosh applications

• X Window System 11R4 server, fonts, libraries, and client applications

• MacX 1.2 server

Development Tools

• Bourne shell, Korn Shell, and C Shell

• Text editing and processing tools, including vi, ex, ed, sed, ditroff, nroff, tbl, eqn, and pic

• Assembler, K&R C compiler, and ANSI FORTRAN compiler

- Linker and shared libraries
- Lexx, yacc, and lint
- adb and sdb debuggers
- SCCS, RCS, and make version control

Installation and Configuration

- One-button Easy Install with option for custom installation
- A/UX Apple Hard Disk SC Setup formats, partitions, and creates file systems on Apple and third-party drives
- System administration scripts simplify routine tasks like adding users
- Memory Control Panel for tuning the UNIX buffer cache
- Macintosh-style text editor

Standards Conformance

- Compliant with AT&T System V Interface Definition (SVID) as verified by System V Verification Suite (SVVS)
- Certified by National Institute of Standards and Technology as compliant with FIPS #151 (IEEE POSIX 1003.1-1990, and ISO 9945-1)

Changes from A/UX 3.0 to 3.0.1 (6/93)

Revised: 6/11/93
Security: Everyone

Changes from A/UX 3.0 to 3.0.1 (6/93)

==========

Article Created: 11 June 1993

TOPIC -----

This article outlines the changes made from A/UX 3.0 to A/UX 3.0.1.

DISCUSSION -----

AppleTalk

- AppleTalk-only network support
- UNIX AppleTalk PAP server routines no longer supported
- UNIX AppleTalk ATP response and request routines not supported

Configuration Changes

- SVFS not configured in kernel by default
- On-board Ethernet driver (ao) configured in kernel by default
- Kernel variables, see tables below
- Default memory footprint of virtual Mac environment (16 MB)

Kernel Enhancements

- Asynchronous I/O
  - asio daemon
  - asioread(2), asiowrite(2), asiowait(2)
- Semaphores
- Memory locking
- Improved kernel bcopy() for 68040s
- Sync daemon

Devices and Peripherals

- Multiple SCSI bus support includes:
  - gdisk and sdisk
  - device nodes, /dev/dsk/cB0Id0sP
  - HD SC Setup
  - Installer
  - devscsi
  - Commando dialog for mount
  - pname
- CD-300
- 500MB and 1GB hard drives
- DAT drives

UNIX Filesystem Enhancements

- Dynamic inode allocation
- catsearch daemon
- Extended (Macintosh) attributes

A/UX Macintosh File Manager Enhancements

- Asynchronous I/O
- Support for more than 500 Open Files
- Environment variables
  - CR-LF mapping for text files, TBTRANSLATEUXONLY
  - file name case insensitivity, TBFMIGNORECASE
  - Pathname separator, i.e., ‘/’ translation, TBTRANSLATESLASHES

Eschatology Not Supported

- No Eschatology partitions
- No more esch, eu, eupdate commands

Installer

- Easy Install server (F/P & DB) packages and partition maps
- Easy Install uses all available space for "Root & User" partition
- Installs alias to A/UX Startup in Startup Items of MacPartition

HD SC Setup

- Multiple SCSI bus support, including Previous & Next buttons
- New Database partition (“raw” partition w/o any filesystem)
- Modified “Free UNIX Partition” now prompts for slice number
- Improved user interface of UNIX filesystem mount point dialog
- Default UFS mount point is “Untitled#” in “/Shared Data”

Other enhancements

- Improved memset() and memcpy()
- Bug fixes
  - UUCP
  - Support for large drives and partitions (2 MB)
  - Support for 1024x768 (19”) third-party monitors
- Auto-login support
- Buffer cache control
  - New Memory CDEV
  - New NBUF value (-1 == 50%)

Integration

- Retrospect Remote bundled
- Doc Viewer and on-line Server
- Applications, Documentation and Shared Data folders in / (root)

Miscellaneous

- Default notification level in CommandShell
- System Folder Alias in /
- lpd(1m) turned off by default in /etc/inittab

Kernel Configuration Parameters Introduced in 3.0.1

Variable	Description	Default
GNOFILE	Global File Table (used by Mac environment)	6144
MSGMAP	Message Map Entries (used by msgop(2))	200
MSGMAX	Maximum Message Size (used by msgop(2))	8192
MSGMNB	Max. Message Queue Size (used by msgop(2))	16384
MSGMNI	Message Queue Identifiers (used by msgop(2))	50
MSGTQL	Number of Message Headers	200
NASIOD	Number of Asynchrounous I/O Daemons	4
NASIOQ	Asynchrounous I/O Request Queue	128
SEMMAP	Semaphore Map Entries (see semop(2))	50
SEMMNI	Semaphore Identifiers (see semop(2))	50
SEMMNS	Total Number of Semaphores (see semop(2))	300
SHMMNI	Shared Memory Segment Identifiers (shmop(2))	100

Kernel Configuration Defaults Modified in 3.0.1

Variable	File & Print	Database	3.0 Defaults
MAXSC	32	32	8
NBLK16	256	256	128
NBLK64	800	800	64
NBLK128	256	256	32
NBLK256	256	256	16

NBLK512	128	128	8
NBLK1024	300	300	8
NBUF	-1	0	0
NCALL	500	150	75
NFILE	7500	1024	256
NINODE	7500	1024	256
NMOUNT	32	32	10
NPBUF	64	64	20
NQUEUE	1200	1200	256
NSTREAM	200	200	32
SBUFSIZE	4096	4096	2048

Network Software Installer 1.3.2: Flaw (6/93)

Revised: 6/15/93
Security: Everyone

Network Software Installer 1.3.2: Flaw (6/93)

==========

Article Created: 15 June 1993

TOPIC ----------

The Network Software Installer (NSI) version 1.3.2 appears to have a harmless error in the Installer script. When run on a Macintosh Quadra 700 with System 7.1, the message that Enabler 201 is being installed flashes across the installer status window, but after the installation there's no file named Enabler 201.

When installed on a Macintosh Quadra 800 that only has the 68040 enabler, the Installer creates a file in the System Folder called Enabler 201. This file contains a single "lefT" resource containing the string "Lefty’s Magic Gibbly-Duplicating Resource."

When installed on a Macintosh Quadra 800 that has all enablers in the System Folder, the Installer modifies only Enabler 201. the only difference we can see is that it adds a single "lefT" resource containing the string "Lefty's Magic Gibbly-Duplicating Resource."

DISCUSSION ----------

The Network Software Installer 1.3.2 "builds" a System Enabler 201 file on any Macintosh the installer is used on, but then the NSI script is supposed to remove the file from all Macintosh computers except the PowerBook Duos. Unfortunately, an Installer bug leaves a copy of the enabler in the System Folder of some Macintosh computers.

This System Enabler 201 may be safely removed from all Macintosh computers except the Duos. Or you may leave it in the System Folder. This is a benign bug that will be fixed in the next release of the NSI.

CD-ROM Booting: Questions and Answers (5/96)

Revised: 6/4/96
Security: Everyone

CD-ROM Booting: Questions and Answers (5/96)

==========

Article Created: 14 June 1993
Article Reviewed/Updated: 23 May 1996

TOPIC ----------

1) How can a CD be the startup disk for any system equipped with a CD-ROM drive?

2) Do the CD-ROM drivers have to be loaded first before you can use the CD? Are the drivers in ROM?

3) Can you explain the start up sequence?

4) Why can I not make my own bootable CD-ROM by simply making a duplicate mirror image of my computer's internal HD on a write-only CD?

DISCUSSION ----------

1) Any Apple system (Macintosh IIci or newer) equipped with an Apple compatible CD-ROM drive (that works with Apple’s CD-ROM driver) can startup from the Install Me First CD-ROM. For detailed instructions reference the article, "Macintosh: Starting From Floppy or CD-ROM Disk," Article 0018059 in the Tech Info Library.

2) Yes, the CD-ROM drivers have to be loaded before you can use the CD. The drivers are read from the driver partition locate on the CD-ROM.

3) When the Macintosh starts up it loads in the drivers of the peripherals attached to the SCSI bus. The drivers are located in the driver partition of each peripheral. When the driver is loaded a simple test is performed to check that the driver loaded will access the peripheral as expected.

4) An image copy would not work because the CD driver code on the CD, and the driver code on the HD, are different. The hard drive image has

the hard drive driver code. (Apple considers the technology to create an Apple bootable CD to be proprietary information.)

Article Change History:
23 May 1996 - Changed reference to TIL article.
18 Nov 1993 - Added question 4.

Apple Workgroup Server 95: AppleShare and NFS Server (6/93)

Revised: 6/14/93
Security: Everyone

Apple Workgroup Server 95: AppleShare and NFS Server (6/93)

==========

Article Created: 11 June 1993

TOPIC ----------

I have an environment with an equal split of Macintosh and DOS computers, with SUN's PCNFS client Software on the DOS computers. A few UNIX computers are used as NFS file servers along with a few AppleShare File servers.

I need to easily share files between all platforms. I want one server that can easily serve all three environments without having to change the client's file sharing software (AppleShare, PCNFS, and NFS).

Is there any technical reason that would exclude the Apple Workgroup Server (AWS) 95 as a multi-platform server in installations where AppleShare and NFS were the filesharing protocols of choice?

DISCUSSION ----------

I don't see any difficulty of an AWS 95 acting as a single platform for both AppleShare and NFS servers.

For PCNFS clients on PC Windows or DOS computers to access files transparently, the AWS 95 must run with "pcnfsd", a special version of NFS server for PCs. The "pcnfsd" daemon is located in the /usr/etc/pcnfsd directory which shipped with the AWS 95. You may have the pcnfsd daemon automatically run from the /etc/inittab file.

For Unix NFS clients to communicate with AWS 95, the AWS 95 server must be configure with "nfs" kernel via the "newconfig nfs" command. The A/UX NFS server /etc/nfsd, will be automatically run by A/UX. The AWS 95 also needs to export the mount points specified in /etc/exports.

Pre-System 7.5 System Folder Files Described (7/96)

Revised: 7/1/96
Security: Everyone

Pre-System 7.5 System Folder Files Described (7/96)

==========

Article Created: 14 June 1993
Article Reviewed/Updated: 01 July 1996

TOPIC ----------

This article gives brief descriptions of the files you'll find in the System Folder of a Macintosh running system software version 7.0 or 7.0.1. The article indicates how the 7.1 System Folder differs.

DISCUSSION ----------

System Software

The Macintosh stores system software in two types of memory: Read Only Memory (ROM) and Random Access Memory (RAM). Sections of the operating system are contained permanently in ROM. This type of system software, which is built into the hardware, is called firmware.

The system software that you install provides updates (new routines and corrected versions of old routines) between major ROM revisions. System and Finder files, device drivers, and other resources found in the System Folder provide these updates. When a system starts up, it loads the data from the System Folder on the hard disk into RAM, where it is stored until you shut down the system.

System Folder

You can't open many of the files in the System Folder because most of them are resource files, not applications. Their use is restricted to the system, but you can remove or copy them, and you can add files to the System Folder. The exact content of a System Folder depends on the Macintosh model and other equipment used with the Macintosh. At the top level, the System Folder generally contains:

- The System file
- The Finder file

- A System Enabler (System 7.1)
- Clipboard file
- Note Pad File
- Scrapbook File
- Apple Menu Items folder
- Control Panels folder
- Extensions folder
- Fonts folder (with system software version 7.1)
- Preferences folder
- PrintMonitor Documents folder
- Startup Items folder

Here are descriptions of the top-level files in the System Folder.

System File

This is the most important file on a startup volume, and is the first file loaded during the startup process. It contains the RAM-based portions of the Mac ToolBox and operating system, ROM extensions and patches, fonts, and sounds. All applications and the operating system share the System file's collection of resources. Every Macintosh startup disk requires this file to start up and run the Macintosh.

Finder File

The Finder is the application that presents and maintains the Macintosh desktop. The Finder keeps track of what files belong in which folders and where they appear on the desktop. It manages disks and files, and launches other programs. Every Macintosh startup disk requires this file to start up and run the Macintosh.

Ordinarily, the operating system designates the Finder as the startup application -- that is, the application that takes control when you first start the system. With System 7, the Finder stays open while you run other applications.

System Enabler

All new Macintosh models shipping after the release of system software version 7.1 include System Enabler software specific for that model or a particular family of models, like the Macintosh PowerBook family. System Enablers provide compatibility between Macintosh hardware and system software. You add a System Enabler rather than reinstalling a new system. System Enablers are located at the top level of the System Folder -- not in the Extensions folder.

Clipboard File

The Clipboard stores data that you have cut or copied.

Notepad File

The Notepad desk accessory uses resources in this file.

Scrapbook File

The Scrapbook file stores graphics and text for the Scrapbook desk accessory. The Scrapbook retains information even after the system shuts down.

Note: If you delete the Clipboard, Notepad, or Scrapbook files, the system recreates them, but they'll be empty.

Apple Menu Items Folder

You install files in the Apple menu by dragging them into the Apple Menu Items folder. You can put any file or alias that you double-click to open or launch (applications, documents, server volumes) in the Apple menu. When you install System 7, the Alarm Clock, Calculator, Chooser, Key Caps, Note Pad, and Scrapbook desk accessories and a Control Panels folder alias appear in the Apple menu.

Control Panels Folder

The Control Panels folder contains resources that allow you to set features, such as date and time. The system draws upon data and instructions provided in these control panel files, sometimes called Control Panel Device Resource files (cdev files). The specific control panel files included with the Macintosh system depends on configuration requirements and user preferences.

Here are some of the control panels you may find in this folder:

- Color
  If you have a color monitor, you can select highlight and window colors.

- Date & Time
  This is for setting date and time for the computer.

- Easy Access
  This supports features the Macintosh provides for disabled people: Mouse Keys (a substitute for using the mouse), Slow Keys, and Sticky Keys (a way to input complex key sequences more easily).

- File Sharing Monitor
  The File Sharing Monitor control panel lets you monitor file sharing activity. It shows you the name of any connected users, and lets you disconnect any connected users.

- General Controls
  You can change features like desktop pattern, and rate of insertion point blinking.

- Keyboard
  Select keyboard layout, and key repeat and delay rates.

- Labels
  Provides the colors and names for the Finder Label menu. You can

change the colors corresponding to the label names here.

- Map
  Type in a city name to see geographic location information.

- Memory
  You can set the disk cache size, and turn on or off virtual memory and 32-bit addressing.

- Monitors
  You can select monitor characteristics (number of grays or colors). You can also set monitor orientation when you have more than one monitor connected to your computer.

- Mouse
  Select tracking and double-click speeds for your mouse device.

- Network
  The Network control panel shows the available data links (LocalTalk, EtherTalk, TokenTalk). These resources are called adevs (AppleTalk Devices). You select which data link to use for network operations. Switching data links causes a temporary loss of network connections.

- Numbers
  This is where you set the format for displaying numbers.

- Sharing Setup
  You can start File Sharing or Program Linking, and you enter information here to identify your computer on the network.

- Sound
  Specify the type and volume of sound for your computer.

- Startup Disk
  If you have more than one hard disk attached to your computer, you can specify which of them is the startup disk.

- Token Ring
  This is used to set transmission speed of the Apple Token Ring 4/16 NB card, to set other operational timers, and to assign a locally administered address used for network management instead of the default hardware address.

- Users & Groups
  Designate who has access privileges to your computer.

- Views
  Select the font, icon arrangement, and list information shown on the desktop.

Extensions Folder

The Extensions folder contains:

- System extensions, called INITs in System 6, (for example, network drivers)

- Chooser extensions, sometimes called rdevs, which stands for Remote Devices (examples include AppleShare, CD-ROM, and printer drivers)

- System applications (for example, PrintMonitor)

- PostScript fonts.

The Extensions folder is the first place the System looks when loading system extensions at startup time.

Printer Software

Printer drivers, sometimes called printer resources, provide the interface to specific printers. You indicate your choice of printers in the Chooser. When you select a printer with the Chooser, the system draws upon the resources in these files. A system must have the resource files corresponding to the printers used with the system.

Here's a list of some printer drivers included with system software version 7.1:

- AppleTalk ImageWriter
- ImageWriter
- LaserWriter
  This is for all LaserWriters except the LaserWriter Pro series.
- LQ AppleTalk ImageWriter
- LQ ImageWriter
- Personal LaserWriter SC
- Personal LW LS
- StyleWriter
- Laser Prep
  This file works with the LaserWriter driver to provide PostScript, the language most LaserWriters use to print text and graphics. The Laser Prep file is rolled into LaserWriter driver version 6.1 and later. The Laser Prep file is required with LaserWriter driver versions 6.0 and earlier, and with AppleShare Print Server 2.0.
- Printer Share
  Printer Share is part of GrayShare, and the extension allows sharing of the StyleWriter II, LaserWriter Select 300, Personal LaserWriter 300, and the Apple Color Printer.

Other Chooser Extensions

Foreign File Access handles the conversion of File Manager calls to ISO 9660 and High Sierra discs. If you have a CD-ROM drive, you need the appropriate software to access it. In addition to Foreign File Access, you need High Sierra File Access and ISO 9660 File Access files.

Network Software

Network software provides the interface to network data links (for example, EtherTalk or TokenTalk).

- A/ROSE
  A/ROSE stands for Apple Real-Time Operating System Environment. It's a system extension that runs as a driver in the standard Macintosh operating system. It downloads, starts, stops, sets priorities, and communicates with real-time processes that run on any A/ROSE-compatible NuBus card.

- EtherTalk Phase 2
  EtherTalk software allows communication with AppleTalk network services over Ethernet networking interface cards and media.

- Network Extension
  The Network control panel uses resources in this extension.

- TokenTalk Phase 2
  TokenTalk software allows communication with AppleTalk network services over Token Ring networking interface cards and media.

- File Sharing Extension
  This allows you to share your Macintosh on the network.

AppleShare

This rdev, or Chooser extension allows you to connect to any Apple File Protocol (AFP) device such as an AppleShare Server, or a Macintosh running File Sharing.

PrintMonitor

This application runs in the background to send spooled information to the printer when you turn on Background Printing in the Chooser. Spooling means that the computer temporarily stores the file on the hard disk. PrintMonitor communicates with the printer in the background, makes a connection with the printer, and sends the file to the printer. When printing is complete, PrintMonitor empties the PrintMonitor Documents folder. System 6 also requires Backgrounder for background printing.

Fonts Folder

If you install System 7.1, you'll have a Fonts Folder that provides a single location for fonts, including TrueType, Adobe Type 1, and bitmap fonts. System software earlier than version 7.1 stores TrueType and bitmap fonts in the System file.

Preferences Folder

The Preferences Folder stores preference files that keep default or current settings for programs. Examples include Word Settings, MsWorksPref, PM4 Defaults, and Excel Settings. It also contains

Dictionary and Help files. System 7-compatible applications create and maintain these files automatically.

PrintMonitor Documents Folder

With System 7, you can print to a LaserWriter or a StyleWriter while you do other work with your Macintosh. For instance, you can print and continue working on a document at the same time. This is called "background printing."

When you turn on Background Printing for printers in the Chooser, files waiting to be printed are temporarily stored in the PrintMonitor Documents folder until the printer is ready to print them. This is all done in the background.

Startup Items Folder

Place in this folder the aliases of all applications and documents that you'd like to have opened automatically when you start the computer. Don't put system extensions in this folder.

This article is one of many available through the Apple Fax center. For a complete list of available fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature). The Apple Fax center is available free of charge 24 hours a day, 7 days a week.

Article Change History:
01 Jul 1996 - Added Fax Doc Word
04 Oct 1994 - Added Note Pad to contents of Apple menu.
07 Sep 1994 - Removed QRG from title, retitled to reflect contents.
18 May 1994 - Added more info about AppleShare.

End_Table

Notes
-----
* This is a theoretical maximum synchronous sustained data transfer rate. The practical data transfer rate varies depending on many factors, such as SCSI chip transfer rate limit, SCSI driver used, hard drive performance, software applications, cables, and other configurations.

Note (1)
The transfer rate of the 53C96 can reach 6MB/sec when using a fast hard drive, provided the cabling is capable of supporting that speed. The cabling and termination of the internal SCSI bus are optimized so that the 53C96 that controls the internal bus can support data transfers at a faster rate (up to 5MB per second with existing faster third-party hard drives). Externally with standard Apple cables, SCSI throughput was rated at 4 MB per second. The improved SCSI performance results in increased system responsiveness when accessing large amounts of data on a fast hard drive.

Note (2)
The internal SCSI channel also supports active termination which improves SCSI bus signal quality and reliability through improved transmission line and terminator design. This means that only one terminator is needed at the end of the external SCSI chain. The external channel's termination also offers a more uniform impedance and cleaner termination scheme. However, because external cabling and termination are less predictable, performance on the external bus could be lower than the internal. Electrically isolating the two channels ensures that changes in external cabling and termination don't impact the performance of the internal devices.

Note (3)
Even though the internal and external SCSI chains are physically different, they are still logically the same, and can therefore, like all Macintosh systems, accommodate up to seven SCSI devices. The added value of the Macintosh Quadra 950 dual-controller design is that the internal hard drive(s) performance won't be affected by problematic devices (like a scanner) attached to the external SCSI connector. Improvements in signal quality on the SCSI bus result in higher SCSI reliability.

Note (4)
The PowerBook 150 only supports external SCSI devices, the internal hard drive is an IDE type drive.

Note (5)
The Macintosh 630 family utilizes an internal IDE hard drive, SCSI is only valid for external drives. The transfer rate external approaches 5 MB/sec.

Note (6)
These computers have dual-channel asynchronous SCSI. There are two completely separate SCSI buses. The Fast SCSI bus is for internal SCSI connections only.

The other SCSI bus is for both internal and external SCSI connections.

Apple IIe Card: How to Install in Macintosh (10/94)

Revised: 6/5/96
Security: Everyone

Apple IIe Card: How to Install in Macintosh (10/94)

==========

Article Created: 8 June 1993
Article Revised: 03 October 1994

TOPIC ----------

How do I install an Apple IIe Card in a Macintosh LC-class or Macintosh Color Classic computer?

DISCUSSION ----------

The Apple IIe Card can be installed in any of these computers:
LC, LC II, LC III, LC 475, LC 575, LC 550, Performa 400, 405, 430, 450, 475, 476, 550, 560, 575, Quadra 605, or the Macintosh Color Classic.

Here are instructions for installing the Apple IIe Card in the LC or Performa:

1) Be sure that your Macintosh LC or Performa computer is off. If your computer is not powered off, then select Shut Down from the Finder's Special menu.

Note: Follow preventive measures to avoid ESD damage. When you unwrap, install, or replace modules, observe the appropriate ESD precautions. For complete ESD prevention information, refer to the ESD Prevention Rules in the SERVICE SOURCE CD-ROM.

If the proper ESD procedures are unavailable, then do the following: Turn off the power and remove the cover. Before going near the logic board, touch the metal of the power supply case.

2) Unplug the power cable from the back of the computer and unscrew the Monitor cable from the back of the computer.

3) Remove the monitor from the top of the computer and set the monitor on a flat, stable surface.

4) Lift up on the locking tabs located on the back of the computer case.

The case will lift up at an angle toward the front of the computer.

5) Remove the Processor Direct Slot (PDS) tab from the back left of the computer. Push the tab from the inside by gently squeezing the tab together.

6) Touch the power supply, located in the back right corner of the computer case, with one hand to remove any excess static electricity.

7) Looking at the bottom of the IIe card, insert the white spacer bar into the middle hole on the IIe card. Angle the back of the IIe card toward the PDS tab opening and bring the front of the card down into the PDS. Press card firmly into place.

8) Replace the computer case by inserting the front end first and bringing the back end down into place. You should hear the locking tabs click into place.

9) Replace the monitor to its original position on the top of the Macintosh LC or Performa computer. Plug the monitor cable back into the monitor port in the back of the computer. Plug the power cable back into the back of the computer.

10) Refer to the manual that came with your IIe card on installing the software required by the IIe card.

Here are instructions for installing the Apple IIe Card in the Color Classic:

1) Unplug the power cable then remove the two security screws from the I/O door then push down on the two latches until the I/O door snaps open. Remove the I/O door.
2) Grasp the logic board firmly with two hands and pull it straight out of the computer.
3) Squeeze together the two plastic latches and pull the metal lock plate off the inside of the I/O door. This provides access to the connectors of the IIe card from outside the computer.
4) Connect the IIe Card to the 96 pin PDS connector (location J8) on the logic board.
5) Carefully slide the logic board back into the computer making sure the board is fully inserted.
6) Feed the cable from the card to the I/O door and securely attach.
7) Replace the I/O door and screws.

Article Change History:
03 Oct 1994 - Instructions for installation in Color Classic added.
30 Sep 1994 - Reviewed for technical accuracy.
30 Aug 1994 - Added all computers that can use the IIe Card.

Macintosh Duo: No SCSI Disk Mode When In Duo Dock (3/95)

Revised: 3/14/95
Security: Everyone

Macintosh Duo: No SCSI Disk Mode When In Duo Dock (3/95)

==========

Article Created: 14 June 1993
Article Reviewed/Updated: 14 March 1995

TOPIC ----------

Is there any way to use SCSI Disk mode when the Macintosh Duo is seated inside the Duo Dock? In other words, is it possible to connect a Macintosh Duo inside a Duo Dock to another, separate, Macintosh by using SCSI Disk mode?

DISCUSSION ----------

The Macintosh Duo 210 and 230 support SCSI Disk mode only through the MiniDock. The Duo Dock acts as a desktop Macintosh and thus won't support SCSI Disk Mode.

Article Change History:
14 Mar 1995 - Corrected wording of MiniDock.

Apple Workgroup Server 95: System error -54 (8/93)

Revised: 8/11/93
Security: Everyone

Apple Workgroup Server 95: System error -54 (8/93)

==========

Article Created: 15 June 1993
Article Reviewed/Updated: 3 August 1993

TOPIC ----------

Apple Workgroup Server (AWS) 95 AppleShare software attempts to startup and returns an error that says, "Have encountered a configuration problem. Please run AppleShare Admin." When I launch AppleShare Admin I get the normal dialog box that says "Looking for shared volumes..." and then an error dialog box saying a System Error -54 has occurred with only a restart option.

DISCUSSION ----------

There two ways to fix the -54 error:

- The error can be corrected by unlocking the User & Groups Data File in the /mac/sys/System Folder/Preferences folder using the Get Info box on the User & Groups data file.

- The error can be corrected by throwing the Users & Groups data file in the Macintosh System Folder in the trash, and recreating User & Groups from the AppleShare admin program manually.

Article Change History:
3 August 1993 - Include additional solution for -54 error.

AppleShare 3.0.2 Patch: Using with AS 3.0.1 Rev. B (9/94)

Revised: 9/27/94
Security: Everyone

AppleShare 3.0.2 Patch: Using with AS 3.0.1 Rev. B (9/94)

==========

Article Created: 15 June 1993
Article Reviewed/Updated: 27 September 1994

TOPIC ----------

The AppleShare 3.0.2 Patch program doesn't upgrade the AppleShare 3.0.1 Rev. B Server. This article tells you what to do to upgrade AppleShare 3.0.1 Rev. B.

DISCUSSION ----------

AppleShare 3.0.3 is the latest maintenance release of the AppleShare 3.0 product. It fixes problems found in the AppleShare 3.0, 3.0.1, and 3.0.2 releases.

Version 3.0.3, also fixes some incompatibilities between AppleShare and AOCE, and AppleShare and AppleSearch. It is recommended that you upgrade your AppleShare server to version 3.0.3 if you will be running either AOCE or AppleSearch on your server.

The AppleShare 3.0.3 patch application will upgrade your AppleShare 3.0, 3.0.1, or 3.0.2 product to AppleShare 3.0.3. It will upgrade the file server and AppleShare Admin to version 3.0.3. It will not upgrade the print server.

These articles can help you locate the AppleShare 3.0.3 update mentioned here:

- "Where To Find Apple Software Updates"
  Lists online services for "free" Apple software updates.

- "Obtaining Apple Product Support in the USA"
  Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech. Info. Library.

Overview

The AppleShare 3.0.2 Patch program provides a simple utility that upgrades your current AppleShare 3.0 or 3.0.1 file and print servers.

Version 3.0.2, besides including all bug fixes made in version 3.0.1, eliminates certain bugs that prevent some backup software from properly saving the Users & Groups Data File (which keeps server security information).

In addition, version 3.0.2 prevents potential incompatibilities with AppleShare server-management software from other companies, such as Server Sentry from Sonic Systems and GraceLAN Server Manager from TechWorks.

Version 3.0.2 also handles more simultaneous user requests, so servers accessed through low-speed network connections, such as AppleTalk Remote Access, may perform better.

For details on using the AppleShare 3.0.2 Patch, please refer to the Read Me file enclosed with the patch.

Won't Upgrade an AppleShare 3.0.1 Rev. B Server

Due to limitations in the patcher application (ResCompare), the patch doesn't distinguish the difference between AppleShare 3.0.1 and 3.0.1 Rev. B, and the patch program will abort. To determine if AppleShare 3.0.1 Rev. B is installed, "Get Info" on the File Server Extension to see if the version string is 3.0.1 Rev. B.

The AppleShare 3.0.1 Rev. B patch was released to Dantz, Jostens Learning Corp. and very few other select customers, so few customers are likely to encounter this problem.

To install the AppleShare 3.0.2 Patch program on an AppleShare 3.0.1 Rev. B server -- PRIOR TO RUNNING THE PATCH PROGRAM -- reinstall the original 3.0 or 3.0.1 File Server Extension replacing File Server Extension 3.0.1 Rev. B. The AppleShare 3.0.2 Patch program will work fine once this in done. All changes in AppleShare 3.0.1 Rev. B are included in the 3.0.2 patch.

No modifications need to be made to an AppleShare 3.0 server prior to running AppleShare 3.0.2 Patch program.

If you run the patch program on a 3.0.1 Rev. B server without replacing the 3.0.1 Rev. B File Server Extension, the patch program aborts. You'll see this error message, or one similar to it:

> "An unrecoverable error occurred while verifying resource CODE 4 (File 10 Code) in the File Server Extension on "hard disk".
>
> "This resource needs to be patched, but its attributes aren't what was expected. Please make sure that you are patching the correct file and version."

After restarting the system, when the server launches a dialog appears stating:

> "Unable to start the server. Please reinstall the AppleShare File Server."

Don't worry if you mistakenly run the AppleShare 3.0.2 Patch Program on an AppleShare 3.0.1 Rev. B server prior to replacing the File Server Extension file. No data loss or corruption will result, Access Privilege and Users & Groups information will remain intact. To recover, reinstall the original (3.0 or 3.0.1) File Server Extension AND AppleShare Print Server file, then run the AppleShare 3.0.2 Patch program again.

Article Change History:

AWS 95: What Is the PDS Card (5/93)

Revised: 8/9/93
Security: Everyone

AWS 95: What Is the PDS Card (5/93)

==========

Article Created: 28 May 1993

TOPIC ----------

What is the PDS card in the Apple Workgroup Server (AWS) 95 for?

DISCUSSION ----------

Installed in the PDS (Processor Direct Slot) of the AWS 95 is a card designed to provide the fastest possible disk I/O for the system. This PDS card will work in the Quadra 900 and 950, but not in the Quadra 700 or 800. The PDS card enables SCSI DMA. Direct Memory Access (DMA) means that data can be transferred from the SCSI bus to main memory by the SCSI controllers without constant attention from the CPU. This enables the main CPU to go on performing other tasks in parallel. This strategy greatly enhances server performance by effectively increasing disk I/O throughput.

Apple Workgroup Server 95: Documentation On-Line (5/93)

==========

Article Created: 28 May 1993

TOPIC ----------

What documentation is available on-line for the Apple Workgroup Server (AWS) 95?

DISCUSSION ----------

The AWS95 ships with an application called the Apple DocViewer, located in the directory:

/Applications/Apple DocViwer v1.0

Documents available for viewing with this application are:

- Apple DocViewer ReadMe
- Apple DocViewer Guide
- Server Admin for A/UX 3.0.1
- Basic Skills

Additionally, AppleShare Pro comes with documentation in DocViewer format. When the AppleShare Software is installed, this documentation will be installed in the Documentation folder in the "/" (root) directory.

The standard UNIX man pages are not loaded on the AWS95 unless a custom install has been done.

Macintosh PC Exchange: Supports 5.25-inch Drives (6/93)

Revised: 6/18/93
Security: Everyone

Macintosh PC Exchange: Supports 5.25-inch Drives (6/93)

==========

Article Created: 16 June 1993

TOPIC ----------

The back of the PC Exchange box says that it "Works with 3.5-inch and 5.25-inch floppy disks formatted using MS-DOS, Windows, and OS/2." Also "Formats 360K or 1.2MB MS-DOS disks on any Macintosh with a third-party 5.25-inch external floppy disk drive."

Does Macintosh PC Exchange work with 5.25-inch PC drives? We've been told repeatedly that it doesn't work with any 5.25-inch drive, including the Apple 5.25-inch drive.

DISCUSSION ----------

Macintosh PC Exchange works with external 5.25-inch low- and high-density drives from these third-party manufacturers:

- Peripheral Land, Inc.
- Dayna Communications
- Kennect Technology

For Macintosh PC Exchange to work properly, you must install the third-party software (that is, driver) that comes with those drives.

Macintosh PC Exchange doesn't work with the "old" Apple 5.25-inch drive (customers will continue to have to use Apple File Exchange), nor with any 5.25-inch Macintosh LC (really, Apple II) drives.

This information should supersede all other information you've seen reported on the compatibility of Macintosh PC Exchange with 5.25 PC drives.

Note that there's one little-known problem when using Macintosh PC

Exchange with Dayna Communications' DOS Mounter. High-density disks aren't supported with the currently shipping version of Macintosh PC Exchange, version 1.0.2. This incompatibility will be fixed in a future version of Macintosh PC Exchange.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

ADB Cable Extensions: Third-Party Solutions (1/95)

Revised: 1/6/95
Security: Everyone

ADB Cable Extensions: Third-Party Solutions (1/95)

==========

Article Created: 4 August 1993
Article Reviewed/Updated: 6 January 1995

TOPIC ----------

Can you tell me if there is any way to increase the Apple Desktop Bus (ADB) cable above the maximum length of 5 meters to 100 feet?

DISCUSSION ----------

Some third party solutions are listed below. To create your own cable you will have to take into consideration the electrical characateristics of the cable and signal, so you may wish to consult with an electrical engineer. If you attempt to build a 100 foot ADB cable, you will have resistance you need to overcome with line drivers or repeaters; you will also have noise, resonance and ringing to deal with, in addition to floating signals (in relationship to ground). Connecting multiple ADB devices compounds these difficulties.

Many of the ADB electrical requirements and characteristics are documented in the Guide to The Macintosh Family Hardware Reference Manual.

Though we do not have a "recipe" for extending an ADB cable beyond our specifications, hopefully this response give you some issues to consider as well as inform you about existing third party solutions.

Kensington Microware, Ltd. sells an Extra Long ADB Keyboard Cable. It is an 8-foot replacement cable, 4-feet longer than the standard Macintosh cable.

Smart Remote, from Sayett, is a wireless, infrared programmable remote control, which can control Macintosh programs up to 35 feet away from the computer. To operate, connect the remote receiver to the ADB bus, and users are ready to use the preset commands, such as forward, inverse and screen blank, which are common to most presentations software. The Smart Remote performs mouse functions and cursor movement, and can be programmed to meet most presentation and training needs.

Display Research Laboratory sells the MR Remote. It includes HyperCard externals and a sample stack. MR Remote is an ADB device for infrared remote control of audio-video equipment, such as TVs, VCRs, LD players, camcorders and. With this product, users no longer need to use equipment with a special computer interface. Instead, they can use a consumer product of their choice, or the one they already have. Users can control the equipment in HyperCard, SuperCard or MacroMind Director. Externals and a sample HyperCard stack for most brands of VCRs and TVs are included.

Switch-Back, from Madenta Communications, Inc., is a powerful interface that enables unique control of the Macintosh computer by any simple switch. When a switch is pressed, Switch-Back makes the Macintosh think a function key on the keyboard was pressed. Desired software tasks may be assigned to the function keys F10 through F15 (for switch 1 through switch 6). Pressing the switch will invoke that task. Any macro program is compatible with Switch-Back. Switch-Back may be connected anywhere on the ADB and accepts input from up to six switches. These switches are plugged into a trio of 3.5mm stereo jacks at the rear of the unit. Other features include: turn on any computer in the Macintosh II family remotely with any push button switch; small, sleek design; FCC Class B certified; switch cable length allowed up to 5,500 feet; and 36 pin Centronics connector for future expansion.

Mac Extend, from Presentation Electronics, Inc., connects to the Macintosh, keyboard and mouse, and to a remote unit up to 1,000-feet away. Mac Extend connects to the Macintosh computer's ADB port, keyboard and mouse, and to a remote unit up to 1,000-feet away via a standard RS-232 cable. The remote unit provides a standard ADB port for a second keyboard, mouse or other ADB device. The system is ideal for presentations, training, multimedia applications and more, where access to a Macintosh at the podium is required, yet the computer must be located at a remote location, such as at a video projector.

To locate a vendor's address and phone numbers, use the vendor name as the search string.

A/UX 3.0.1: Does Not Support Apple Color OneScanner (2/95)

==========

Article Created: 15 June 1993
Article Reviewed/Updated: 17 March 1995

TOPIC ----------

Is the Apple Color OneScanner supported under A/UX 3.01?

DISCUSSION ----------

According to A/UX Product Management, the A/UX 3.0.1 SCSI driver does NOT work with he Apple Color OneScanner. As of June 1993, we are unaware of the time frame for the driver to work with the Apple Color OneScanner under A/UX 3.0.1.

NOTE: The Apple Color OneScanner is different from the Apple Scanner and Apple OneScanner. The driver included in the A/UX kernel supports the Apple Scanner and Apple OneScanner, but NOT Apple Color OneScanner.

This article describes the Energy Star program.

DISCUSSION ----------

Energy Star is a voluntary Environmental Protection Agency program that sets energy use ceilings on computer products. The Energy Star program seeks to identify and promote the use of energy efficient computer equipment to reduce energy use and thereby reduce pollution.

Computers, monitors and printers can meet Energy Star program requirements by always using less power than a specified amount or by going into a low-power or "sleep" state. Printers must also go to a low-power state within a period of time defined by performance category. All computers, monitors and printers that meet these specifications can display the Energy Star logo.

Apple was one of three original companies contacted by the EPA to help design the Energy Star program and has consistently been an enthusiastic supporter of the program. Apple's goal is to make Energy Star products available across the entire Macintosh product line as quickly as possible.

Many Apple products already meet Energy Star specifications. Other Apple products can meet Energy Star specifications with the addition of third-party devices which shut off power when the product is not being used.

Energy Star Specifications

Computers and monitors must be able to go to a low-power state either after a period of inactivity or at a predetermined time selected by the user. For computers, the low-power state can be activated with software that must be specified by the computer manufacturer. This low-power state is defined as

drawing 30 watts or less of power. If the monitor is included in the computer casing and isn't powered directly from a wall outlet, the entire system may qualify by drawing 60 watts or less of power.

Printers must be able to go to a low-power state either after a period of inactivity or maintain a low level of power consumption. For printers that enter a low power state, the printer must activate a low-power state within the times listed below.

Printer Speed (pages per min.)	Default Time to Low Power (minutes)	Max. Power Use in Low Power (watts)
1 to 7	15	30
8 to 14	30	30
15 and above, all color laser printers	60	45

Note that computers, monitors and printers that always consume less than the specified amount qualify for the Energy Star program.

Apple Workgroup Server 95: MacTCP Out the Serial Port (6/93)

==========

Article Created: 16 June 1993

TOPIC --------------------

How do I change MacTCP to work out of the LocalTalk port, either as well as or in place of the built-in Ethernet port of the Apple Workgroup Server (AWS) 95?

DISCUSSION --------------------

The MacTCP implementation that runs under A/UX does not support the LocalTalk interface. The CDEV is really just a window into the unix based TCP driver and does not offer the same functionality as the Macintosh OS version.

LaserWriter Driver 8.0: PageMarq 15 Printer (6/93)

Revised: 6/21/93
Security: Everyone

LaserWriter Driver 8.0: PageMarq 15 Printer (6/93)

==========

Article Created: 17 June 1993

TOPIC ----------

I'm having a problem with the Laserwriter 8.0 driver and PageMarq 15 printer (with fax option). Apparently the printer driver does not allow printers with a fax option to tone dial, but forces them into pulse dial.

DISCUSSION ----------

Apple spoke with Compaq technical support. They suggested that the customer use the Compaq Fax Utility v1.09 which builds a Fax driver from the LaserWriter driver. The resulting Fax driver then provides the ability to select tone or pulse dialing.

In terms of the LaserWriter 8.0 driver providing this capability, it would have to be added to the PPD file for the PageMarq printer. Apple notified Compaq technical support regarding this issue. They will be forwarding this information to their engineering department. Since it is the responsibility of the printer manufacturer to supply the PPD files, you might have the customer ask Compaq for a prospective release date for the new PPD.

To locate a vendor's address and phone number, use the vendor's name as a search string.

Apple Workgroup Server 95: Setup For FTP Logins (10/94)

Revised: 10/21/94
Security: Everyone

Apple Workgroup Server 95: Setup For FTP Logins (10/94)

==========

Article Created: 16 June 1993
Article Reviewed/Updated: 21 October 1994

TOPIC ----------

How do I setup the Apple Workgroup Server (AWS) 95 to accept anonymous FTP "logins" for file transfer?

DISCUSSION ----------

Follow these steps:

1) If the bnet driver is not already in the kernel then add it by doing a "newconfig ao". You can check to see if the bnet driver is installed by doing a "module_dump /unix".

2) Edit the /etc/inittab file and set the "inetd" deamon to "respawn" and "portmap" to "wait". Example:

```
nfs0:2:wait:/etc/portmap        #set to "wait" for networking
net9:2:respawn:/etc/inetd       #set to "respawn" for networking
```

The newconfig command is supposed to do this for you but you'll want to check to make sure since when we ran the script it failed to update the file.

We did more investigation and the way 3.0.1 works is the Ethernet driver and the bnet driver are both included in the base kernel configuration. The AWS 95 manual states that you should run "newconfig ao" to enable TCP/IP services. Unfortunately it only does half the work for you. If you use the "ao" parameter to newconfig you will have to manually edit the /etc/inittab file. If you use the command "newconfig bnet" all the files will be created properly and the inittab file will also be properly modified. We tell you this because the manual tells you to use "ao" as the parameter to "newconfig".

3) Create an ftp user in the /etc/passwd file. Example:

```
     ftp::9:9:ftp user:/usr/spool/ftp:
```

4) Create an ftp group in the /etc/group file. Example

```
     ftp::9:ftp
```

5) Password protect the ftp UID to prevent unauthorized use of the login by console or telnet users. Example:

```
     passwd ftp
     Enter new password of ftp: ...
```

6) Test the configuration by attempting to ftp from another system.

Apple Workgroup Server 95: A/UX 3.0.1 Information (5/93)

Revised: 6/17/93
Security: Everyone

Apple Workgroup Server 95: A/UX 3.0.1 Information (5/93)

==========

Article Created: 24 May 1993

TOPIC ----------

A/UX 3.0.1 is the native operating system of the Apple Workgroup Server (AWS) 95. A/UX 3.0.1 is an optimized version of A/UX 3.0, Apple's implementation of industry standard AT&T UNIX System V with BSD 4.2 extensions. A/UX uses the full System 7 interface.

DISCUSSION ----------

Performance

Apple has spent considerable effort ensuring that this system runs server applications as fast as possible. The major efforts are detailed below:

- Slimmer code paths
  Apple has gone to great lengths to eliminate any performance bottlenecks in the system. This includes a full rewrite of the AppleTalk code and optimization of most of the file manager and SCSI toolbox.

- SCSI Direct Memory Access (DMA) support
  DMA support is necessary for asynchronous I/O. It means that memory control is off loaded from the main processor. There is a special DMA controller the allows the operating system to move data to and from the disk subsystem without constant attention from the main CPU. In the conventional Macintosh implementation the CPU must explicitly fetch data from the SCSI bus and place it in main memory one block at a time. However, with a DMA architecture the CPU can hand off a large quantity of data to the DMA controller which then takes care of moving the data to or from the hard disk while the CPU can continue on a perform other tasks in parallel. The main CPU doesn't have to wait for the relatively slow hard disk before going to the next task.

The A/UX 3.0.1 SCSI disk driver has been modified to allow selection among the four SCSI busses available on the AWS 95 platform. Referring to disk drives is different on the AWS 95 than under traditional A/UX. Each disk must be identified not only by its SCSI address, but also by the SCSI bus that it is attached to. The SCSI busses are numbered 1 through 4. In previous versions of A/UX a SCSI drive with address 5, drive 0, slice 0 would be specified through the device file /dev/dsk/c5d0s0. Now you must also specify the bus number. The new format is /dev/[r]dsk/cb0ad#s#, where "b" is the SCSI bus (numbered from 1 to 4) and "a" is the SCSI address (numbered from 0 to 6). The SCSI busses are numbered in the order they are searched in the Mac environment: main logic board internal, main logic board external, PDS card internal, and PDS card external. The busses are numbered from 1 to 4 instead of from 0 to 3 to avoid the problem of forcing leading zeros when generating device file names. The old format, /dev/[r]dsk/c#d#s#, where c# is the SCSI address, d# is the logical unit number, and s# is the slice number will continue to work. The c# field will specify both the SCSI bus and the SCSI address of the device. The current device files (/dev/dsk/c[0-6]d#s#) will refer to the device that is visible to the Macintosh OS regardless of what SCSI bus the drive resides on. This is for backwards compatibility.

For example, these path names map in the following way:

Pathname	SCSI ID	SCSI bus
/dev/dsk/c203d0s0	3	main logic board external
/dev/dsk/c403d0s0	3	PDS card external
/dev/dsk/c3d0s0	3	wherever it is found first

- Faster Semaphores
  A/UX allows many processes to run at the same time (in parallel). Often, these processes are interdependent. The database must make sure that the data is wants to write successfully is written before it can process a request to retrieve that data for a different user. Parallel processes can communicate with each other through semaphores. A semaphore is a signal sent from one process to another. In the example above, the database engine will wait for a semaphore from the operating system acknowledging that the data has been successfully written. Semaphores under A/UX 3.0.1 have been optimized for speed because they are used frequently by server processes.

- Intelligent I/O
  Input/Output (I/O), moving data to and from the disk drives and the network, is the primary bottleneck in most server systems. Apple has spent significant effort in the AWS 95 and in A/UX 3.0.1 to optimize the performance of I/O. By using UNIX and a hardware DMA architecture the AWS 95 can perform asynchronous I/O transfers. This is a primitive method of multi-processing. It means that the SCSI or Ethernet controllers can transfer data to or from the network or the disk subsystem at the same time, while the main CPU is performing other tasks. The CPU simply asks the DMA controller to transfer a certain block of data and then goes on to the next task while the transfer takes place in

parallel. When the transfer is complete the system can send a semaphore to the application to mark the completion of the transfer so the application can then access the data from main memory.

- Optimized AppleTalk
  The AppleTalk networking code has been re-written in A/UX 3.0.1 to allow a significant performance speed-up. The network software is now able to transfer clusters of packets together instead of one at a time. Many delay loops have been removed. And network code has been trimmed wherever possible.

- General I/O tuning
  A/UX 3.0.1 has had its I/O performance enhanced wherever possible. The installer will set initial kernel parameters differently depending on which configuration, file/print server or database server, is being installed.

Login

When the AWS 95 is first powered on it will immediately launch A/UX (through an alias in Startup Items). A/UX 3.0.1 will go straight to the Finder, logging in as root if (and only if) there is no password on the root account (the default installation). If the administrator chooses to add a password to the root account, A/UX 3.0.1 will stop at the standard A/UX Login screen and wait for a password. In the File/Print server configuration there is a text file called "Autologin" in the Preferences Folder of the Login System Folder which contains the name of the account for the system to automatically login to. By default it is set to root. This file is not present in the database configuration.

An important note is that the root user must be logged in at the console and running the Macintosh environment for the AppleShare server to run since AppleShare Pro is still a Macintosh application. The Oracle database server can run in the background without having a user logged in at the console.

Apple Workgroup Server 95: Installer Tips (5/93)

Revised: 6/17/93
Security: Everyone

Apple Workgroup Server 95: Installer Tips (5/93)

==========

Article Created: 24 May 1993

TOPIC ----------

This article describes Apple Workgroup Server (AWS) 95 installer tips.

DISCUSSION ----------

Software comes pre-installed, however, customers may wish to add new disk drives to the system, re-configure the installation, or re-install in the event of corrupted software. All software for the AWS 95 is included on one CD-ROM. Therefore a CD-ROM drive is needed for installation. Furthermore, it must be an Apple CD-ROM drive or other CD-ROM drive compatible with A/UX.

By default, the A/UX system that is pre-installed or that is installed when the "Easy Install" option is chosen is a minimal A/UX system. This configuration does not include some UNIX utilities, NFS, compilers, and so on. To install the extra parts of A/UX you must launch the installer and use the Custom Install option.

To perform an installation, simply insert the boot floppy disk into the floppy disk drive, insert the installation CD-ROM into the CD-ROM drive, and power on the machine. The AWS 95 will automatically bring up the Easy Install screen.

WorkStation One for Macintosh (6/93)

Revised: 6/18/93
Security: Everyone

WorkStation One for Macintosh (6/93)

==========

Article Created: 17 June 1993

TOPIC ----------

I'm look for technical & sales informations on WorkStation One for Macintosh from IBM .

DISCUSSION ----------

We were able to get to IBM's InfoLink and we did find an article on WorkStation One for the Macintosh (there is a Windows version as well).

WorkStation One:

- Uses TCP/IP connections to VAX and IBM Hosts.
- Uses Telnet for Terminal emulation.
- Has some IBM scripting language for Autologon.
- Allows keyboard remapping.
- Does TCP/IP FTP file transfers.
- Does back-up and restore to a variety of LAN servers (OS/2, MicroSoft LAN Manager, Novell Netware).
- Runs on Token Ring or Ethernet, so it must depend on MacTCP with Token Ring extension.

A portion of the IBM product document abstract is below:

Workstation One For Macintosh

Abstract

Workstation One for Macintosh is a licensed program which is designed to make it easier for the workstation user to access and run applications residing on certain IBM and DEC host systems. It also includes support to allow file transfers, backup, restore, and local area network (LAN) usage.

All of these functions run under a common, graphic interface. Transparent application access to the IBM or DEC host allows the end user to point-and-click on an application icon in a window without knowing where the application resides. Once an application is selected, the user is automatically logged on to the appropriate host, the correct terminal emulator is loaded, and execution of the application begins. This is accomplished by using a script language which is provided by Workstation One for Macintosh. The product includes a variety of graphic and text emulators as well as an imbedded runtime library for support for Token-Ring and Ethernet protocols. The host system TCP/IP is a prerequisite. The IBM Workstation One product is implemented on multiple vendor operating systems: IBM OS/2, IBM AIX, Microsoft Windows, and Apple Macintosh.

Technical Description

The major functions provided by Workstation One for Macintosh are:

- Application Access - Allows users to access applications on the workstation and hosts running TCP/IP communication software without having to know where the application is or how to invoke it. Application Access provides:

  - Terminal emulation - Users can access TCP/IP hosts and host applications via Telnet terminal sessions. The terminal type and session characteristics are chosen by the user at the start of the terminal session or saved into session profiles (document files) for subsequent use. If the host OS and network allow, the user can connect from the Telnet session to any accessible host (whether or not it is a TCP/IP host), such as with the VM PassThrough facility or the VAX Set Host command.

    Users can copy and paste between PC applications and host display areas. Graphics can be copied from a host display to PC application but not vice versa. Text can be copied to and from a host display. The host display window can be printed using the standard window-printing facility.

  - Script generation and maintenance - Allows the user to create and compile scripts to used to perform logon sequences (passwords are encrypted), application invocation, application operations, or any combination of these interactions.

    The script language consists of commands that an emulator uses to interact with hosts and host applications in the same way that the user would otherwise have to do manually. An executing script program checks the host screen for messages, status, and prompts, and sends strings and keystrokes to the host to navigate through these stages on the host.

    Users can invoke scripts either at terminal session connection time or at any time during an existing terminal session.

  - Keyboard mapping - At any time during active terminal sessions or

before starting terminal sessions, users can view the current mapping of the keyboard for the three terminal types supported (VTxxx, 3270, and Tektronix). The mapping can be changed and made effective for terminal sessions established after restarting the host access function.

- Workstation/Host File Transfer - Allows the workstation user to upload and download files between the user's workstation and hosts running TCP/IP communications software. This function also provides the capability for users to manage files on the workstation and TCP/IP hosts by renaming or deleting them. File Transfer uses the FTP protocol. Its capabilities are totally independent of terminal emulation and, except for data security aspects particular to the host, can be used without respect to existing terminal sessions with the same hosts accessed for file transfer. Various options can be selected before the session starts and saved into a file transfer session profile, or document file, named by the user. These options include a default transmit data type, file extension translation, and the option to receive confirmations before any operation is performed. This document file can be subsequently used any time the user wants to access data on that host. It can be opened from an icon or folder or from the FILE menu.

  The functions available for data on workstations and hosts include:
  - Copying (uploading and downloading)
  - Deleting
  - Renaming
  - Explicit FTP commands for which there are no buttons (such as change directory on host or workstation)

- Backup/Restore - The Backup and Restore (BR) functions provide users with mechanisms for storing and retrieving copies of the workstation files to and from LAN server media as protection against local disk failure or unintentional file deletion. The BR functions operate in a graphical user interface.

  They support source (backup from or restore to) and destination (backup to or restore from) media accessible by the workstation operating system. The user may back up data from or restore data to the workstation hard disk or a virtual disk (a volume or drive located on a LAN server but visible to the workstation as another disk).

  A scheduler or reminder function allows the user to create "profiles" of various types of backups, at differing times or intervals, including differing files, folders, or directories. BR provides the capability to perform:
  - full backups, including every file or directory or folder selected
  - incremental backups, including only those files modified since the last backup
  - differential backups, including all files modified since the date specified, regardless of when they were last backed up
  - individual directory, folder, or file backups

  Backup operations maintain directory or folder structure where

applicable.

Conversely, there is the means for restoring the data in the forms described for backup. Restore operations also maintain directory structure where applicable.

BR functions log information related to each backup and restore operation, indicating which files have been backed up, when the backups were performed, and where the backup was stored.

Users can also specify that old backup storage files on the LAN server are to be deleted at backup time. Old backup storage files may be overwritten (that is, reused) at backup time.

To the extent allowed by the workstation operating system, BR users can execute other functions while a backup or restore operation is running in the background.

Operating Environment

Machine Requirements

Workstation One for Macintosh is designed to operate on a Macintosh workstation configured with the minimum requirements specified below and communicating with one or more of the following hosts and servers:

Workstation Requirements
- Macintosh SE (68000 processor)
- Network adapter (Apple TokenTalk or EtherTalk or equivalent)
- 4MB of hard disk for Workstation One for Macintosh
- Memory and hard disk sufficient for the required software listed, (minimum 4 MB of RAM recommended)

Server Requirements
- IBM PS/2(R) 80386 processor (or equivalent)
- NDIS- or ODI-compliant network adapter (Token-Ring or Ethernet)
- Memory and hard disk sufficient for the required software listed
- Uninterruptible Power Supply (recommended)

Host Environments
- IBM processor capable of supporting VM TCP/IP or MVS TCP/IP with Token-Ring or Ethernet connection and/or
- DEC VAX Processor with Ethernet connection

Programming Requirements

Workstation Requirements
- Macintosh Operating System 6.0.5

Server Requirements
- OS/2 1.3 Standard Edition (P/N 84F7588) or
- OS/2 1.3 Extended Edition (P/N 15F7195)
- Microsoft LAN Manager 2.0 or 2.1

- Microsoft LAN Manager Services for Macintosh 1.0 or
- DOS 4.0 (P/N 6024869) or
- DOS 5.0 (P/N 84F9775)
- Novell NetWare 3.11
- Novell NetWare for Macintosh 3.0
- Novell NetWare NFS 1.1

Host Environments:

- IBM Hosts
  MVS system which supports:
  - MVS TCP/IP Version 1 (5685-061) or
  - MVS TCP/IP Version 2 (5735-HAL)
  VM system which supports:
  - VM TCP/IP Version 1 (5798-FAL) or
  - VM TCP/IP Version 2 (5735-FAL)
- DEC Hosts:
  VAX VMS system which supports:
  - WIN/TCP Versions 5.1 or 5.2, or
  - VAX/UCX Version 1.2.

Apple Workgroup Server 95: PDS Card Description (5/93)

Revised: 6/18/93
Security: Everyone

Apple Workgroup Server 95: PDS Card Description (5/93)

==========

Article Created: 24 May 1993

TOPIC

Installed in the PDS slot of the Apple Workgroup Server (AWS) 95 is a card designed to provide the fastest possible I/O for the system. There are three major parts to this card. This PDS card will work in the Quadra 900, but not in the Quadra 700 or 800.

DISCUSSION

SCSI DMA

The PDS card in the AWS 95 is equipped with two NCR 53C96A SCSI controller chips running at 33 MHz along with supporting circuitry to enable SCSI Direct Memory Access (DMA). DMA means that data can be transferred from the SCSI bus to main memory by the SCSI controllers without constant attention from the CPU. This enables the main CPU to go on performing other tasks in parallel. This strategy greatly enhances server performance by effectively increasing disk I/O throughput.

The PDS card has three SCSI connectors, two internal and one external. There are two internal connectors so that it is possible to connect disk mirroring or RAID devices that can use two SCSI busses in parallel for better performance. The four SCSI busses are numbered, 1 through 4:

1 Main logic board internal
2 Main logic board external
3 Accelerator card internal
4 Accelerator card external

These numbers will appear in the AWS 95 version of HD SC Setup. These numbers are also important in specifying disk drives inside A/UX.

The total AWS 95 system now has four separate SCSI busses, two on the main logic board and two on the accelerator card. Because each bus can support seven devices the theoretical limit on SCSI devices is 28. However, there is only enough space and connectors for 20 devices. The separation of SCSI busses is available because A/UX 3.0.1's SCSI disk drivers have been written to handle them. The Macintosh OS is unable to distinguish SCSI devices with the same ID, but on different busses. It is also important to note that the I/O acceleration is only provided to SCSI devices attached to the PDS card, not to those attached to the main logic board because the DMA circuitry is only on the card. When adding disk drives to the AWS 95 system it is important to make sure that they are attached to the SCSI connectors on the PDS card, not to the main logic board.

L2 cache

This is high-speed static RAM (SRAM) which decreases access time for data from the disk. Most server applications spend a lot of time reading and writing the same data for different users. By implementing a large secondary cache, the most used data resides in high-speed SRAM instead of the much slower disk drive. The PDS card cache caches both instructions and data.

L2 stands for level 2. This means that the cache is farther away from the processor than the 8K on-chip cache in the 68040, which is considered level 1, L1, or primary cache. On the PDS card in the AWS 95 the L2 cache is direct-mapped write-through cache. This kind of cache is more useful for reads than writes because writes just pass through and go all the way to main memory. Read performance is significantly enhanced because the processor doesn't have to go all the way to main memory for instructions or data that are in the cache. Direct-mapped cache means that the cache occupies a fixed address space. This makes it easier to implement in system software because the cache is invisible to software. All cache management is done transparently in hardware so applications do not need to be re-written to be cache-aware.

- TAG RAM
  The AWS 95 PDS card has 128 K of SRAM built in. It can be optionally upgraded to 256 K or 512 K through three SIMM sockets. When upgrading from 128 K to 256 the user must also install a tag RAM SIMM. When upgrading from 256 K to 512 K there is no need to add more tag RAM.

Parity checking

Most server customers are very concerned about data integrity. By implementing parity checking the operating system can detect any errors in the RAM hardware and flag them immediately. Parity checking insures that data is not lost between the CPU and the system memory. By default, parity checking is turned off in the AWS 95 software. There is a check box within the A/UX Startup application allowing the administrator to turn on or off parity checking in the system. Parity checking may slightly affect overall server performance. AWS 95 systems will be shipped from Apple with 9-bit parity DRAM installed. Standard non-parity DRAM can be installed, however parity checking will no longer work when non-parity DRAM is present.

Upgrade Kit

Apple will offer a kit to upgrade a Macintosh Quadra 900 or 950 to the AWS 95 platform. The upgrade kit includes the PDS card and the software on CD-ROM.

Apple Workgroup Server Product Family (5/93)

Revised: 6/18/93
Security: Everyone

Apple Workgroup Server Product Family (5/93)

==========

Article Created: 24 May 1993

TOPIC ----------

This article describes the Apple Workgroup Server product family.

DISCUSSION ----------

- Apple Workgroup Server 60
  Low-cost file-and-print server for small "Mac-mainly" workgroups, based on Centris 610 hardware, Macintosh System 7, and AppleShare 4.0.

- Apple Workgroup Server 80
  Midrange file-and-print server for medium "Mac-mainly" workgroups, based on Macintosh Quadra 800 hardware, Macintosh System 7, and AppleShare 4.0. The Apple Workgroup Server 80 comes with integrated DDS tape backup drive and Retrospect Remote backup/administration software.

- Apple Workgroup Server 95
  Powerful file-and-print server and database workgroup server. Based on Macintosh Quadra 950 hardware, PDS upgrade card, and A/UX 3.0.1 operating system.

  File server configuration: AppleShare Pro.

  Database configuration: Oracle 7 database system.

  The Apple Workgroup Server 95 comes with integrated DDS tape backup subsystem, two disk drives, 32 MB RAM, four SCSI channels for up to 28 SCSI devices, and Retrospect Remote backup/administration software.

Apple Workgroup Server 95: Performance Enhancements (5/93)

Revised: 6/18/93
Security: Everyone

Apple Workgroup Server 95: Performance Enhancements (5/93)

==========

Article Created: 24 May 1993

TOPIC ----------

This article describes the Apple Workgroup Server 95 performance enhancements.

DISCUSSION ----------

Apple has made several enhancements to make the Apple Workgroup Server (AWS) 95 the fastest possible server using today's Macintosh technology. The major pieces are:

- Quadra 950
- Server accelerator card
- A/UX 3.0.1
- AppleShare Pro
- Oracle 7

The Quadra 950 is built around a high-speed 33 MHz 68040 processor and high performance I/O subsystems. The I/O is further improved by the circuitry on the accelerator card. This card specifically speeds disk I/O through the use of a large cache and new high-performance SCSI controllers with full support for Direct Memory Access (DMA). By using A/UX the AWS 95 gains performance by fully supporting asynchronous I/O, increasing both network and disk performance, along with a high level of stability by employing UNIX, a time-tested and extremely robust operating system. AppleShare Pro is the only version of AppleShare fully tuned to take advantage of the features of the AWS 95 including async I/O, faster AppleTalk and filesystem performance. Finally, Oracle 7 for the AWS 95 has also been fully optimized to take advantage of the performance enhancements in the AWS 95.

Apple Workgroup Server: AppleShare Pro & AppleShare 4.0 (5/93)

==========

Article Created: 24 May 1993

TOPIC -----

The AWS 95 comes with AppleShare Pro. This is the highest performance version of AppleShare and has been enhanced to get the most out of the added I/O performance features and tuning of A/UX 3.0.1. For the most part anyone familiar with AppleShare 3.0 will find it extremely easy to switch to AppleShare Pro. There are just a few A/UX related differences that an administrator will have to watch out for. After creating AppleShare Pro the team took much of the code (except for the A/UX-only pieces) and created AppleShare 4.0. The AWS 60 and AWS 80 come with AppleShare 4.0. Any System 7 based system with a 68040 processor can also run AppleShare 4.0. The features described below pertain to both AppleShare Pro & AppleShare 4.0 unless otherwise noted.

DISCUSSION -----

Performance Features explained

- Read-ahead
  This is the single most important performance feature of the new AppleShares. When a client makes a request of the server that requires reading, the server will read more than the client requested, or "read ahead". The server makes an assumption of what the next logical section of disk should be and reads it into RAM. In general, the client will ask for that section in its next network request and receive an immediate response because the data is already in RAM. If the client does note request that data or requests something else, then nothing is lost because the server will read the new data into the same RAM space (overwriting the unnecessary bits).

- Write behind
  The most time consuming operation from a user's point of view is to write

to a file server. This is the order of operation for previous versions of AppleShare:

1) server receives data block from network and stores it in RAM
2) server gives filesystem pointers to data in RAM, requests it be written to disk and waits for reply from filesystem
3) filesystem writes data to disk then verifies the write
4) filesystem replies to server
5) server notifies client of write completion and asks for next data block

In the new AppleShares, the server uses "write behinds". After step 1 above, the server skips to step 5 and informs the client of write completion even though it had not actually been done at the time the server sent the notification. In theory, the writes are lagging behind the messages. Because of the difference in speed between networks and high speed SCSI devices, by the time the user gets the message the write may have actually completed (depending on the filesystem and load).

Since A/UX 3.0.1 has intelligent I/O, whenever multiple writes are pending the filesystem will spool several write requests, organize them in disk order, position the disk head, and then SCSI burst them all onto the disk in one pass. This makes AppleShares Pro the fastest server under heavy load and multiple write conditions.

- File, directory, and icon caching
  The new AppleShares also allow for the use of main memory as a level 3 cache. There are a few parameters that must be set by the administrator in the File Server Cache Preferences window. Following are the general guidelines for setting cache sizes.

  Set the Number of Files to Cache to 20. If many files will be open at the same time, raise this value to 40. Leave the Cache Size for Each File at its default of 64K.

  In determining the Folder Cache Size for a server with random usage patterns (that is, when users are as likely to access one file or folder as they are any other), multiply the number of shared files and folders by 0.2K. A large server (for example, a server with 10,000 folders and files) might allocate 2000K for the Folder Cache Size setting. For a server on which specific folders are used repeatedly and most others are accessed infrequently, multiply the number of shared files and folders by 0.05K (for the same server of 10,000 folders and files, use 500K).

  Leave the Icon Cache Size at its default of 256K.

  Check to make sure that the Total Cache Memory Size should be less than half the value of the Total Available Memory.

- Number of simultaneous users
  AppleShare Pro can support a maximum of 200 simultaneous users; however, the Maximum Number of Connections is set to 100 by default. AppleShare 4.0 can support a maximum of 150 simultaneous users; however, the Maximum

Number of Connections is set to 75 by default.

The administrator can change this value in the File Server Preferences window.

Apple II support, but not booting

Apple II net booting support will not be activated; but, ProDOS will continue to be supported. This will allow Apple II's to continue to log onto AppleShare Pro. For Apple II booting, AppleShare 3.0 will still be available as a product.

Full International Support

All changes that were requested to upgrade AppleShare 3.0 to provide international support have been made to both AppleShare 4.0 and AppleShare Pro .

Anti-Piracy in AppleShare 4.0

Each legitimate AppleShare 4.0 File Server copy will have its own unique serial number assigned at manufacturing time. This serialization will make people more aware of software piracy. This will help honest people stay honest and is not a heavy-handed, fool-proof, copy-protection scheme. It will allow people to demo the software, but will make life annoying for them unless they purchase it. When a duplicate serial number is detected on the network, both servers will display an alert asserting that fact. After several hours the greeting message for clients will show the same alert. The longer the server runs after detection, the more frequently the duplicate detection alert will be displayed to all users. A tool will be produced to allow network administrators and Systems Engineers to discover how many duplicate copies of AppleShare 4.0 are running on an internetwork.

2+ GB disk support in AppleShare Pro

Previous versions of AppleShare were limited to a 1.999 GB volume size because the Macintosh Finder is unable to handle larger volumes. Since the AWS 95 uses the A/UX filesystem, it can handle disks 2 GB and larger; however, the Finder-based AppleShare clients can not. To use a larger disk on the AWS 95 simply share partitions of less than 2 GB each as separate AppleShare volumes.

Mount point considerations in AppleShare Pro

UNIX filesystems are hierarchical with only one root, the startup volume. If there is more than one physical disk (or partition) all volumes must be connected to that startup volume. These connections are made with "mount points". The administrator chooses a folder on the startup volume for each additional volume to connect to. The additional volume then appears as a folder within the chosen folder (this is the "mount point").

Since AppleShare Pro runs atop the A/UX filesystem, there is one special consideration when sharing. Folders with mount points in them can not be

shared. This includes the A/UX startup volume (which has the Mac startup volume mount point in it). Any number of specific folders on the startup volume can be shared as long as they do not have mount points inside them. If an administrator needs to share the entire contents of a folder with a mount point in it, he/she must open the folder and share everything inside it, then select and share the volume that is connected to that mount point. This can become an administration headache; therefore, it is best for the administrator to choose the location of the mount points so that it is not necessary to share the folders that contain them.

macControl: Overview (6/93)

Revised: 6/18/93
Security: Everyone

macControl: Overview (6/93)

==========

Article Created: 16 June 1993

TOPIC ----------

This article gives an overview of macControl, a DAL-based EIS (executive information system) from Germany.

DISCUSSION ----------

macControl is an information system software package that is appropriate for executive information systems (EIS) and decision support systems (DSS) at all levels of management. It provides an intelligent workstation environment in an on-line host relational database system, and a flexible object-oriented tool set for system development. macControl is designed to comply with the information system architecture, VITAL (Virtually Integrated Technical Architecture Lifecycle).

END-USER ADVANTAGES

It gives access to data at different levels, and can on demand summarize and view data in various ways. The graphical user interface allows text, graphics and data to be within the same screen simultaneously even though the information may be coming from separate databases or computers.

It provides a cooperative processing environment. This means that the client isn't limited to just sending queries to the host, and the host isn't limited to just sending data files to the client. Instead, this cooperative processing allows task performance on the computer, or by the software product, that is best suited for the task. And further, it provides two-way communication among users. In other words, you can enter data or update it using either the mainframe or the local computer.

The product platform provides report writing, extensive graphics, complete spreadsheet capability, local multi-dimensional database, functions and

macros, multiple levels of security (through Usernames, Passwords, and User-dependent data access; of course, the host computer's security requirements must also be fulfilled), publish and subscribe, program launching, and so on. You can use all of these facilities interactively with the host. You can automatically generate letter-quality, paper-based reports.

macControl allows data updates, structural changes, screen modification and other maintenance requirements to be centrally administered and automatically distributed.

DEVELOPER ADVANTAGES

macControl is an enterprise computing software package designed to provide the developer with a tool to create an information system in a client-server or cooperative processing environment. macControl itself is an object oriented, multi-dimensional database with an object oriented interface. It operates in a distributed database environment using Data Access Language (DAL). It requires no coding or scripting.

The product can communicate with the host (or hosts) in a read/write mode. You can centrally administer workstations and automatically update them for changes in the database structures. macControl automatically generates the SQL commands necessary to perform user requirements (including commands such as: joins, data summations, minimum/maximum/average, sort, and so on).

The source database or databases can be organized in various ways. macControl can work effectively with databases dedicated as management support systems or inquiry databases. It can work with operational system databases, or directly from a view or series of views. It can also operate with a combination of management support and operational databases, and views. Developers can integrate macControl into existing systems with little or no disruption, or into newly designed systems.

macControl is a Macintosh-based software product, written to Apple Computer standards, and updated for all relevant Apple enhancements. The program makes full use of Macintosh networking capabilities.

macControl uses a graphic and object oriented interface with data driven screens. You give commands through point and click, context sensitive hot spots, and menus. Commands, pictures, objects, sounds, charts, local formulas, and local data are held in macControl's multi-dimensional, object-oriented database. This database, even though on the local workstation, is administrated, updated and centrally stored on the main host.

The automatic SQL commands are produced based on the multi-dimensional structural design of the macControl application. It accommodates highly normalized SQL databases, and macControl does the following:

- Creates commands for the consolidation hierarchies and to reflect their multi-dimensional nature
- Provides the multi-dimensional required views

- Optimizes the command for speed of retrieval and data volume
- Provides means for complex summations
- Allows merging of different time series, and
- Facilitates exception reporting.

In structuring an application, the developer can select from the available, automatically displayed, databases and tables. The selections are then associated with macControl's multi-dimensional groups and attributes. Based on these associations, the screens and worksheets can be rapidly developed.

1) The user selects from the menu buttons the desired data combinations.
2) The menu combinations activate formulas that tell macControl's database manager the type of SQL commands that need to be sent.
3) The data is returned from the host.

At this point, the data is temporarily held in the macControl application structure allowing the data to be presented in a variety of views. (This provides significant advantages over SQL query and query-like tools.) Further, the user has an option, if permitted by the security system, to retain some of the data locally (typically high level data). You can use the data further in portable systems (such as a PowerBook). The operation is totally transparent.

macControl provides ad hoc reporting capabilities and data analysis tools. The developer doesn't have to anticipate all user inquiries, and the user has some degree of freedom in acquiring desired information. Through built-in system commands such as launch, and publish and subscribe, you can use and integrate standard or custom communication programs.

macControl can run in a stand-alone version, network version, run-time version, limited-host version (storage of data on host only), and a full-host version (storage also possible on local computers, that is, PowerBook).

PC platform: Macintosh IIci or larger, including PowerBook; 8MB of RAM recommended.

CLIENT/SERVER ENVIRONMENT

Data for an EIS/DSS is located in a number of places and may exist in many different formats within the computers of an enterprise. Therefore data transfer is of great significance in an EIS/DSS application.

The flexibility of EIS/DSS software in facilitating data transfer and storage is a critical issue in the software selection process. As a rule, software should be able to work with data stored in local networks within individual workstations or multi-workstations, handle ASCII data transfers, and operate on-line with host or multi-host data.

macControl´s Working Environment

- Server - Hardware

    - IBM Mainframes
    - IBM Workstations
    - DEC Vax
    - DEC Ultrix
    - AT&T
    - DG Aviion
    - DG Eclipse
    - HP 9000
    - NCR 3000
    - Sun
    - Apple Macintosh
    - MS-DOS
    - Sun
    - Tandem

- Server - Operating System

    - A/UX
    - VM/CMS
    - MVS/TSO
    - MVS/VTAM
    - DOS/VSE
    - VAX/VMS
    - UNIX SVR4

    - DG/SQL
    - Nonstop SQL
    - P.ink

- AS 400 SQL

MACCONTROL TECHNICAL DATA

- General Features
  - Rapid prototyping and development
  - Structured data base on entity-relationship principles
  - Automatic SQL-generation
  - Dynamic worksheets with selection menus
  - PC and host oriented - with relational data base communication capabilities
  - Communicates with strategically important standard software
  - Exceptionally good user interface
  - "data" and "structure" driven screens

- EIS/DSS Development Environment
  - Object orientation
  - Time series orientation
  - Selection menus
  - Multiple Drill-down
  - Pull-down Menus
  - Windows
  - Text processing
  - Definable calendar

- Graphic Presentation
  - 46 different graphic types
  - Graphic formats
  - Graphic combination
  - Graphics within graphics

- Functions
  - Mathematical
  - Statistical
  - Print
  - Finance
  - Time
  - Test- and Documentation
  - Reporting

- Data Import
  - Communication with relational data bases with Apple's DAL
  - Reads all ASCII formats

- Technical Aspects
  - 55 Dimensions
  - 32,000 attributes per dimension
  - 32,000 dynamic worksheets

- Client/Server Hardware
  - Client: Apple Macintosh models (Motorola 68030 processor and upward)
  - Host: Hardware from major host, workstation and PC vendors

Apple Workgroup Server and Oracle 7 (5/93)

Revised: 6/18/93
Security: Everyone

Apple Workgroup Server and Oracle 7 (5/93)

==========

Article Created: 24 May 1993

TOPIC ----------

This article describes the Apple Workgroup Server (AWS) 95 and Oracle 7.

DISCUSSION ----------

The database configuration of the AWS 95 is installed with a version of A/UX 3.0.1 optimized for database performance, especially with Oracle 7. The A/UX kernel parameters have been tuned for use with Oracle. The database configuration of the hardware also includes a larger L2 cache because database applications benefit more from a larger cache than other services. Also with the database configuration there are two internal hard disks, a 230 MB which holds the operating system and database software, and another 500 MB or 1 GB drive for storing database files and data. By having two disk drives I/O performance is enhanced because the system can read and write to both drives at the same time.

Oracle is the highest performance relational database management system (RDBMS) available on a PC platform. Oracle is now introducing their new version: Oracle 7. Apple and Oracle engineers have worked together for nearly a year optimizing A/UX and Oracle 7 for performance together. Their efforts have made Oracle version 7 and the AWS 95 a very fast RDBMS system capable of greater than 50 transactions per second (tps).

AWS 95: Performance & Fault Tolerance Drives (5/93)

Revised: 6/18/93
Security: Everyone

AWS 95: Performance & Fault Tolerance Drives (5/93)

==========

Article Created: 24 May 1993

TOPIC ----------

The Apple Workgroup Server (AWS) 95 will initially be available with internal hard disk drive capacities 230 MB, 500 MB, and 1000 MB. For customers especially concerned with performance and fault tolerance there will be several solutions available from third parties implementing various levels of RAID technology.

DISCUSSION ----------

RAID

Since servers need very fast, very large, and very reliable or fault tolerant disk subsystems the AWS 95 will support a variety of RAID devices. RAID stands for Redundant Array of Inexpensive Disks. RAID devices provide a level of disk mirroring or data redundancy, along with higher performance than conventional disk drives, or SLEDs (Single Large Expensive Disk). RAID devices come in several configurations, numbered 0 through 5. The number indicates the level of striping, or distribution of data across multiple disks.

Below is a brief description of RAID configurations:

- RAID 0 describes a single disk that uses striping redundancy techniques, but is still a single disk.

- RAID 1 describes simple disk mirroring. Disk mirroring means having two separate disk drive mechanisms that appear to the system as a single volume, but all data is written to both disks at the same time. Therefore there is always a backup. In the event that one disk fails, the other disk will contain all of the data and the system can continue to run until the failed disk is replaced and rebuilt. Some

implementations allow the CPU to read from the disks in parallel and therefore reduce seek time, enhancing overall performance.

- RAID 2 uses a large number of disks (10 or more) and uses 30% - 40% of them for checking or parity information. This way when each block is written to the system a checksum (interleaved Hamming code) is generated and stored on one of the check disks. In the event of a failure the data on the failed disk can be reconstructed from the data on the check disks. Because of the large number of disks required and its optimization for large blocks of data RAID 2 is relatively impractical for PC or workgroup solutions. RAID 2 is found primarily on mainframes.

- RAID 3 employs a single check (or parity) disk for several data disks. When a block is written to the volume the data is distributed across the data disks, then a checksum (XOR) is written to the parity disk. Because data is written and read in parallel from many disks, performance is highest for large blocks of data. RAID 3 implementations are not as efficient with lots of small bits of data. However, RAID 3 uses proportionally more disk space for data and less for parity (~20%) than a RAID 1 system.

  It is important to remember that the majority (70-80%) of time taken in reading or writing is seek time. Having multiple disk mechanisms means the drives can seek to different places at the same time. While one drive is writing, other drives can be seeking so when the system gets to the next drive it is ready to read or write immediately. This is true for all multiple disk RAID implementations.

- RAID 4 systems are best for frequent small reads. Here there is only one parity disk for multiple data disks. Check information is written to the parity disk for each sector that is written to a data disk. The data is spread on the data disks a full sector at a time. Since there is only one disk for check data writing is slower than reading, but more disk space is available for data.

- RAID 5 is the most efficient, highest performance, and most reliable implementation. This system spreads the check data across all disks in the array allowing check data to be written in parallel with other data on other disks. RAID 5 also allows "hot-swapping" meaning that a failed disk can be removed and replaced in the array while the system is still running. The data on the failed drive can be rebuilt on the new disk by recombining the check bits on the other disks. This system is completely redundant and extremely fault tolerant. It is also best for reading and writing both large and small blocks of information.

Apple Workgroup Server and Tape Backup System (11/94)

Revised: 11/29/94
Security: Everyone

Apple Workgroup Server and Tape Backup System (11/94)

==========

Article Created: 24 May 1993
Article Reviewed/Updated: 29 November 1994

TOPIC ----------

This article describes Apple Workgroup Servers (AWS) and its tape backup system.

DISCUSSION ----------

The AWS 80 and the AWS 95 are available with an optional internal tape backup drive. This drive uses digital tapes (the same form factor as DAT (Digital Audio Tape)) of a high grade quality. The tape drive is usually referred to as a DDS-DC drive. This stands for Digital Data Storage - Data Compression. This drive requires that tapes used for recording meet the Media Recognition System (MRS) standard. This restriction ensures that the tapes used are of high enough quality to support large volumes of compressed data reliably.

This tape drive uses special hardware compression to maximize the amount of data that can be reliably stored on a tape. Because of the compression, it is difficult to estimate the exact capacity of a tape. Some data is more compressible than other data. We estimate that a single tape, of 90m in length, will store between 4 and 7 GB of data, depending on compressibility of the data.

Article Change History:
29 Nov 1994 - Added maximum tape length.

StyleWriter II: Spacing and Margin Errors With ATM (6/93)

Revised: 6/28/94
Security: Everyone

StyleWriter II: Spacing and Margin Errors With ATM (6/93)

==========

Article Created: 21 June 1993
Article Reviewed/Updated: 28 June 1994

TOPIC ----------

I'm having trouble using Adobe Type Manager (ATM) with a Macintosh Classic and the StyleWriter II.

When printing with Microsoft Word or MacWrite II, the printouts show erratic spacing between words, as well as words falling out of the set margins.

DISCUSSION ----------

The problems encountered are known problems with the StyleWriter II drivers earlier than version 1.2 when used with ATM. This ONLY occurs on 68000-based Macintosh computers (that is, Macintosh Plus, SE, and Classic).

Upgrading to the StyleWriter II printer driver v1.2 or later will solve this problem. A workaround using earlier version is to turn Background Printing OFF, enabling Fractional Character Widths, and/or NOT using "Full Justification" might help a little.

Article Change History:
28 June 1994 - Added StyleWriter II version that fixes the problem.

StyleWriter II Margins: Word Processor Line Layout Code 6/93

Revised: 6/21/93
Security: Everyone

StyleWriter II Margins: Word Processor Line Layout Code 6/93

==========

Article Created: 21 June 1993

TOPIC ----------

I am using WordPerfect and printing to a StyleWriter II. I have set each margin (top/bottom/left/right) to exactly one inch.

The application shows everything at the proper margins, however when printed, the top and bottom margins are off. The top margin is off by 1/16th of an inch. I would assume this is within tolerance. The bottom margin however, is 1/4 of an inch off, so the bottom margin is actually 1 and 1/4 inches.

DISCUSSION ----------

On the StyleWriter II, 1/16th of an inch is the acceptable tolerance all the way around (top/bottom/left/right).

The 1/4 of an inch blank space on the bottom (in addition to the margin) occurs because another line of text can't fit in that area. Each application's line layout code determines how tall a line of text is, and then decides whether or not it will fit into the remaining space at the bottom of the page. This can be verified rather easily by changing all of the text in a page to 4 Point text. With 4 Point text, the height of a line is very small, so there should be little or no white space left at the bottom, except for the 1/16th of an inch tolerance from the margin.

Other word processors also demonstrate the same margin problems. It seems that word processors use similar line layout calculations. A possible resolution to this problem can be implemented in the applications themselves by taking into account that the last line of text doesn't need any inter-line spacing below it. With this in mind, the "theoretical" height of the last line would be less, and one more

line could be printed.

Performa 400: Printing to a Citizen Swift 200 (8/96)

Revised: 8/28/96
Security: Everyone

Performa 400: Printing to a Citizen Swift 200 (8/96)

==========

Article Created: 21 June 1993
Article Reviewed/Updated: 27 August 1996

TOPIC -----

Can I connect a Performa 400 to a Citizen Swift 200 centronics printer? Would the Macintosh Print Pack be of any benefit?

DISCUSSION -----

Apple was unable to obtain any information on the Citizen Swift 200 printer since it is a European product. We contacted Citizen USA and they referred us to Citizen Europe Corporation for any questions related to the Citizen Swift 200 printer. Citizen Europe Corporation can be reached (from the USA) by calling at 011-44-753-584-111. They are located in the United Kingdom.

However, if the Citizen Swift 200 printer can emulate an Epson (FX or LQ), Kodak (Diconix 701), or Canon (BJ-10ex) standard then the Macintosh Print Pack will work for your customer. Here are the specific drivers included with the Print Pack and the types of printers they support:

Driver/standard	Printer Type
Epson FX	9-pin dot matrix printers or some line printers
Epson LQ	24-pin dot matrix printers
Canon BJ-10ex	Compact/Portable Ink-Jet printers
Diconix 701	Compact/Portable Ink-Jet printers

These drivers are all selectable in the Chooser. The Print Pack also comes with a serial to parallel cable (din8 to Centronics) for the hardware interface.

Article Change History:
27 Aug 1996 - Correct spelling.

ABS Tech Note: AUX00 About A/UX Tech Notes (6/94)

==========

Article Created: 23 June 1994

TOPIC ----------

This document accompanies each release of Apple Business Systems Technical Notes.

DISCUSSION ----------

As of this release, A/UX technical notes have been merged with the Apple Workgroup Server technical notes. For reference, the A/UX technical notes have been renamed as follows:

AUX01, SHMAT Limitations is now AWS23
AUX02, Multiple Printers is now AWS24
AUX03, Flushing the data cache is now AWS25

All future technical notes will be released under the Apple Workgroup Server heading.

DAL For AS/400: View Smaller Table List (6/93)

Revised: 6/22/93
Security: Everyone

DAL For AS/400: View Smaller Table List (6/93)

==========

Article Created: 21 June 1993

TOPIC ----------

I connected via DAL to SQL/400 on an AS/400. From the client side I used the DAL Tester to send the following command to the DAL server:

```
open sql400 dbms;
open database "daldemo";
```

This statement ran fine.

But when I sent the following command:

```
describe tables; printall;
```

The result was a listing of all the tables of all the libraries.

How do I get only the tables of the current database as described in the DAL reference manual?

DISCUSSION ----------

We can clarify this issue for you.

1) It is not possible to limit the table list to "only" the tables in the database that is open. The AS/400 environment is one whole database to SQL/400 so there is no way to keep it from scanning all the Libraries for File/Table names.

   The only thing that can be done to limit the list of tables is to create a "view". This view will be the same one used by ANY database name you open.

   While the database name is not restrictive in the AS/400 environment, it is useful. When you do the "Open Database" command in DAL you set up that database name as the default library. Then you do not have to prepend the database name in your SQL statements unless the table (file)

chosen is in another library than the default (opened) database.

That is:
```
open database "DALDEMO";
```

gives you access to all the tables within that library without having to say "DALDEMO." before the tablename. That is you can now say:
```
select * from offices; printall;
```

instead of
```
select * from daldemo.offices; printall;
```

If you had opened a database named "MYDATA":
```
open database "MYDATA";
```

to access the data in 'offices' you would now HAVE to say:
```
select * from daldemo.offices; printall;
```

2) The DAL for AS/400 Install Guide was not correct in defining how to create the SQL View (Appendix B). An article was written to explain how to create the view properly as well as how to set up a "limited" list in the view.

Please check the Tech Info Lib on AppleLink. Search for "DAL and AS/400" and you should see an article named: ESD Technical Note: DAL21 AS/400 Install Doc Update (2/93).

That should help you set up a smaller table list. Be aware however, that you can only have one view per user profile (whether their own separate one, or a site-wide one). So you want their "describe tables" list to contain ALL of the tables you would want to have access to through DAL, regardless of whether those tables were in multiple libraries.

Macintosh: SCSI Devices Should Be On at Startup (6/93)

Revised: 6/28/93
Security: Everyone

Macintosh: SCSI Devices Should Be On at Startup (6/93)

==========

Article Created: 16 June 1993

TOPIC ----------

I am having difficulty starting my Performa 450 when it is connected to an external Micronet 30MB SCSI hard drive that is turned off. When I connect the drive to the SCSI port and attempt to boot the computer, it will only boot if the Micronet drive is turned on first. I would like to be able to boot (from the internal hard drive) with the external drive connected but turned off. I want to do this because I will not need the drive turned on all the time and the fan is rather loud.

DISCUSSION ----------

The SCSI bus requires termination power to provide clean SCSI signals. When a SCSI device has its own termination power, the SCSI bus signals are corrupted when the device is off because this leaves the SCSI bus unterminated. A non-terminated SCSI bus can cause startup problems because of noise on the bus.

Sometimes, a SCSI device supplying its own termination power can remain off at startup because it has a relatively clean SCSI bus signal. But there is no guarantee that the bus signals will stay clean and uncorrupted, as it is improperly terminated in this situation.

SCSI devices that use termination power from the Macintosh can be off and still be properly terminated.

Since your external SCSI device only works with the power on, it is a problem with the external device. If another Macintosh starts up successfully when this external hard drive is turned off, it may be because older Macintosh computers were more tolerant regarding SCSI noise and termination issues than are newer models.

Macintosh: Generating Unusual ASCII Characters (6/93)

Revised: 6/24/93
Security: Everyone

Macintosh: Generating Unusual ASCII Characters (6/93)

==========

Article Created: 16 June 1993

TOPIC ----------

My newspaper's mainframe requires the use of an ASCII character I've been unable to generate on the keyboard of my new Performa 405. Is there a way to generate ASCII character 152 from a Macintosh keyboard?

DISCUSSION ----------

Any ASCII character number over 128 changes depending on the type of computer you are using. On the Macintosh, character 152 is the ograve. To create the ograve, you need to hold down the option key and press the ` key at the same time, release those keys, then press the letter o. This creates the ograve character, a letter o with an accent (`) on top.

Use the Key Caps desk accessory to preview various key combinations in various fonts.

Performa and System 7.5: Turning Off Layer Hiding (6/95)

Revised: 6/19/95
Security: Everyone

Performa and System 7.5: Turning Off Layer Hiding (6/95)

==========

Article Created: 16 June 1993
Article Reviewed/Updated: 19 June 1995

TOPIC ----------

I have just purchased a Performa 405 computer that uses System 7.1P. I also use a Macintosh that uses regular System 7.1. How can I turn off the feature in System 7.1P that hides all open programs and the Finder when I launch a different program?

DISCUSSION ----------

There is a feature in System 7.x for the Performa and for System 7.5 called layer hiding. This feature hides the background windows, showing only the active window.

System 7.5
==========

Under System 7.5, layer hiding is part of the General Controls control panel. To prevent layer hiding:

Step 1: Open the General Controls control panel.
Step 2: Click the Show Desktop In Background box.
Step 3: Close the Generals control panel.

After you close the General Controls control panel, you need to restart your computer

Older Versions of System 7.xP
==========

System 7.01P, 7.1P, and 7.1P2

Under these versions of the Performa system software, the layer hiding feature is built into the Launcher application.

To prevent layer hiding, remove the Launcher control panel from your Control Panels folder. If you place the Launcher control panel in another location, you can still use it, but the layer hiding feature is disabled.

After you move the Launcher control panel, you need to restart your computer.

System 7.1P3, 7.1P5, and 7.1P6

Under these versions of the Performs system software, the layer hiding feature is built into the Performa control panel. To prevent layer hiding:

Step 1: Open the Performa control panel.
Step 2: Click the Finder Hiding button.
Step 3: Cose the Performa control panel.

After you close the Performa control panel, you need to restart your computer.

Article Change History:
19 June 1995 - Corrected incorrect control panel nomenclature
21 Feb 1995 - Added keyword; made minor technical updates.
16 Dec 1994 - Added information on System 7.1P3 and above.

Performa: Virus Protection Tips (6/93)

Revised: 6/24/93
Security: Everyone

Performa: Virus Protection Tips (6/93)

==========

Article Created: 16 June 1993

TOPIC ----------

I have found the nVir A virus on my Performa. I can clear it from everything except the System (which says it is busy) and Finder. The anti-virus program I am using says that I should use a locked system diskette to clear the virus completely, but this computer comes with software already installed, and without system disks. What do I do next?

Also, what would you recommend as a good beginner's anti-virus program for the Performa?

DISCUSSION ----------

Depending on the type of virus detection program you have, you may be able to run after starting up from the Utilities disk that came with your Performa. If your virus program is an application, then start the computer from the Utilities disk (put the Utilities diskette in the drive immediately after turning the computer on). Then run the virus program that is on the hard drive. This allows it to remove the virus from the system on your hard drive. If your virus program is a control panel or an extension, then this solution may not work, and you may need to contact the makers of the virus program to get instructions on removing the virus.

There are too many anti-virus programs to recommend any specific one, but almost all fall into one of two categories:

- The first kind loads into the computer's memory when the computer turns on and checks diskettes and software as they are loaded onto the system. This type of program works best for keeping viruses from getting onto your system, but may cause incompatibility with some of your software.

- The second kind checks the computer only when you tell it to. Since it

does not load into memory when the computer is turned on, it does not conflict with other software. However, because you launch the anti-virus program manually, it will normally find viruses only after they are on your computer.

Performa 405: Computer Speed and FPU Upgrades (6/96)

Revised: 6/18/96
Security: Everyone

Performa 405: Computer Speed and FPU Upgrades (6/96)

==========

Article Created: 16 June 1993
Article Reviewed/Updated: 18 June 1996

TOPIC ----------

Is the Macintosh Performa 450 faster than the Macintosh Performa 405? If it is, how can I speed up my Macintosh Performa 405?

DISCUSSION ----------

Because of its faster clock speed and 32-bit data bus, the Macintosh Performa 450 is approximately twice as fast as a Performa 405.

You can improve the performance of your Performa 405 by adding an FPU (floating point unit), commonly known as a math co-processor. Math co-processors handle the math computations of a given program, therefore freeing up the processor for other tasks. For math intensive programs there is an improvement in speed.

Apple does not currently offer a math co-processor for the Macintosh Performa 405 (or the Macintosh LC II). However, there are other companies that do offer FPUs for these computers. These computers do not have an FPU slot so you would need to purchase an LC PDS card with an FPU on it.

The drawback is that not all applications use the FPU. The only way to increase speed in all applications would be to purchase a third-party accelerator card for the Macintosh Performa 405.

Article Change History:
14 Jun 1996 - Clarified information.
09 Jul 1993 - Updated to include LC II

Performa: Application Not Found Message (6/93)

Revised: 6/24/93
Security: Everyone

Performa: "Application Not Found " Message (6/93)

==========

Article Created: 16 June 1993

TOPIC ----------

We've been downloading shareware and we keep getting a screen that says that the application program can't be found. This also happens with some stuff that came on the hard drive, like clip art files.

Also, I think I need HyperCard 2.0 for one of my programs. Is this loaded on the Performa 405 or is it shareware or a commercial program?

DISCUSSION ----------

The message "The application program that created it could not be found" will come up in two instances.

The first is when you try to open a document when you do not have the application that created it on your hard drive. Most likely the shareware programs you are downloading are compressed to save space and download time. They require the program that compressed them in order to uncompress them. Some common compression programs and the extensions they add to the end of the name of the documents they create are:

Program	=	Extension Name
Compactor	=	.cmp
StuffIt	=	.sit
PackIt	=	.pit
Disk Doubler	=	.dd

(There are others as well.)

Example: A file named Game.sit is compressed by StuffIt and you will need a copy of StuffIt to uncompress it.

These uncompressing programs will usually be on the same downloading service where you got the file. If you cannot find them, ask the sysop of the board.

When you double-click on clip art files you also get this message, because the graphic program that created these files did not come with your Performa. But you can still use these files. You have a program called ClickArt ClipOut under the Apple menu and it allows you to use these files. Just hit the Open button at the bottom of the tool palette of the ClickArt ClipOut window.

There is another way to use these files. Most programs come with the ability to translate or at least open the files created in other programs. For example, your Performa 405 probably came with ClarisWorks or WordPerfect Works. These applications are capable of reading graphic documents even though they did not create these documents. You do this by opening the document from within the program. Consult the manuals for these programs, or call the vendors for more specific instructions on how to open foreign file formats.

The other time you might get the "application not found" message is when your computer loses track of where the application is located on your computer, though this is rare. You can fix this problem by rebuilding the desktop file. This file keeps track of what applications open what type of documents and the icons that go with these files. Refer to your manual on page 220 for information on rebuilding the desktop.

HyperCard 2.0 is not included with your Performa computer. But you do have HyperCard Player. This version of HyperCard allows you to play stacks, or open them up and view them. If you wish to make stacks or edit them, you need to purchase HyperCard 2.0 from Claris Corporation. This is a commercial program.

Non-Apple Printers: Printing from Performa (6/93)

Revised: 6/24/93
Security: Everyone

Non-Apple Printers: Printing from Performa (6/93)

==========

Article Created: 16 June 1993

TOPIC ----------

What is the best way to connect my Citizen GSX-140 printer to a Macintosh Performa?

DISCUSSION ----------

If your printer is Macintosh compatible, the only software necessary for communication from your Macintosh Performa to your Citizen printer is the printer driver. The printer driver gives your computer specific information about the piece of hardware that is connected. Once you have a printer driver installed, and your Performa can communicate with your printer, any System 7 compatible application program may be used to construct documents and print them.

If your printer is not Macintosh compatible, and has a standard Centronics parallel port, the Apple Print Pack is your solution. The Print Pack includes special software printer drivers to allow Epson FX and Epson LQ emulation, as well as Kodak Diconix/Canon BJ10EX drivers for compatible ink jet printers. It also includes a special printer cable that allows a Macintosh to connect with virtually any printer having a standard Centronics parallel port.

Before you make a purchasing decision, it will be necessary to contact Citizen, and determine some specifications:

1) Is the Citizen MS-DOS-compatible, Windows-compatible, Macintosh-compatible?

2) Does the Citizen utilize dot matrix, ink jet, or laserjet technology?

3) Does the Citizen employ a standard Centronics parallel port?

4) Does Citizen have a printer driver available for the Macintosh?

By answering these questions, you can determine which course of action (Citizen printer driver or Apple Print Pack) is the best solution for you.

Performa: Connecting a CD-ROM Drive (6/93)

Revised: 6/24/93
Security: Everyone

Performa: Connecting a CD-ROM Drive (6/93)

==========

Article Created: 16 June 1993

TOPIC --

I want to connect an external CD-ROM drive to my Performa 450. Which port on the back of the Performa do I hook it to? Do all CD-ROM drives on the market come with the proper connecting cable for the Performa?

DISCUSSION --

An external drive of any type (hard drive, CD-ROM drive, optical drive) connects to the SCSI port on the back of the Performa. The SCSI port is the long narrow one near the center of the back of the machine.

Some companies include a SCSI cable with Macintosh-compatible drives, and others require that you purchase the cable separately. Check with the drive manufacturer or the dealer and ask them if they "bundle" (include) a cable with the drive. AppleCD drives (Apple's CD-ROM drives) do not come bundled with a SCSI cable.

Performa: Can Use System 7.1 (3/94)

Revised: 7/18/94
Security: Everyone

Performa: Can Use System 7.1 (3/94)

==========

Article Created: 16 June 1993
Article Reviewed/Updated: 8 March 1994

TOPIC ----------

Why does Apple ship Performa computers with a special version of system software instead of standard Macintosh System 7.1? Will regular System 7.1 run on the Performa?

DISCUSSION ----------

Performa System 7.1P contains several enhancements designed to make the Performa products especially easy to use, particularly for first-time users and families with children. These enhancements are not part of standard Macintosh System 7.1 software.

Performa System 7.1P enhancements include:

- Launcher. Allows users to locate and launch applications easily while retaining full Finder access.

- Default Document Folder. Documents are automatically saved and stored in this location.

- Layer Hiding. Allows users to switch to the Finder or another program by clicking on the application menu.

- At Ease. Makes it easy for users to launch applications and open documents while protecting system settings, files and folders, and the hard disk.

  Because Performa computers are likely to be shared by more than one person in the family, At Ease prevents multiple users from inadvertently erasing valuable files.

- Backup and Restore. Provides a simple interface for users to create a

set of backup disks and restore the contents on their hard disk.

If you prefer to run System 7.1, it works fine with Performa computers, though the above enhancements will not be included.

Since most Performas have a CPU equivalent in the traditional Macintosh product line, it is possible to use traditional System 7.1 in many cases, provided the appropriate enabler is installed. Apple's official policy however, is that use of a non-Performa operating system on a Performa is not tested, recommended, or supported by Apple. For that reason, the following chart is provided for informative purposes only.

How to use this chart: If you want to use a traditional Macintosh OS on a Performa, find the Performa on the left. If this Performa has a traditional Macintosh equivalent (as shown in the 3rd column), then you can use regular system 7.1 with the enabler listed in the 4th column. For example, to use traditional 7.1 on a Performa 600, use enabler 001, which is the enabler for the IIvx. Remember: this is not tested, recommended, or supported by Apple.

Performa Model	Performa Enabler	Traditional Macintosh Equivalent	Traditional Macintosh Enabler
Performa 200	n/a	Classic II	n/a
Performa 400	n/a	Mac LC II	n/a
Performa 405	n/a	Mac LC II	n/a
Performa 410	n/a	Mac LC II	n/a
Performa 430	n/a	Mac LC II	n/a
Performa 450	308	Mac LC III	003
Performa 460	308	* none *	* none *
Performa 466	308	* none *	* none *
Performa 467	308	* none *	* none *
Performa 475	364	LC 475/Quadra 605	065
Performa 476	364	LC 475/Quadra 605	065
Performa 550	332	* none *	* none *
Performa 600/CD	304	Mac IIvx	001

Article Change History:
8 Mar 1994 - Included chart of Performa and traditional Macintosh enabler equivalents.

Performa: Apple Restore Backup Made With MS-DOS Disks (10/94)

Revised: 10/11/94
Security: Everyone

Performa: Apple Restore Backup Made With MS-DOS Disks (10/94)

==========

Article Created: 16 June 1993
Article Reviewed/Updated: 11 October 1994

TOPIC ----------

Sometimes, after backing up your Performa's hard disk with Apple Backup, you may find that you need to restore the hard disk to its original state. If you try performing a Restore, and the Performa does not recognize your set of backup floppy disks, it doesn't mean that your backup is gone.

DISCUSSION ----------

Why the Disks Aren't Being Recognized
==========

Your backup floppy disks may have come preformatted for MS-DOS machines. However, your Macintosh Performa comes with a control panel called PC Exchange that lets you read and write to MS-DOS formatted disks. So, when you made your backup, the Performa was able to read the disk format and write your backup to it. But now, starting up from the Utilities disk, your backup floppy disks are not recognized because the PC Exchange control panel is not present.

Here are two different work-arounds that let you use your current backup. One tells how to create a new Utilities disk which contains PC Exchange, while the other describes how to restore from your backup after formatting your backup disks. There's also a section on reformatting your backup floppies if you do NOT need to restore from your MS-DOS disks.

Workarounds
==========

The first work-around is to put a copy of PC Exchange onto the Utilities disk, then use the backups you made to the MS-DOS disks. To do this, follow these steps:

1) Make a copy of your Utilities disk. Drag every icon on the copy

into the Trash, except the System Folder (including its contents) and Apple Restore.

2) Copy the PC Exchange control panel from your Performa into the Control Panels folder of your Utilities disk copy.

3) Run Apple Restore from the copied Utilities disk as you normally would. You should be able to restore your backup from the MS-DOS formatted disks.

Another work-around is to remove the backup files from your disks, reformat the disks to Macintosh format, then copy the backup files back to the disks. To do this, follow these steps:

1) Insert the first backup disk into your Performa, then open the PC floppy disk icon by double-clicking.

2) Drag the Apple Backup archive file from the floppy disk to your hard disk.

3) Re-initialize the disk to Macintosh format.

4) Drag the Apple Backup archive file from your hard disk to the floppy disk, then eject the floppy.

5) Repeat these steps for each of the MS-DOS formatted backup disks.

6) Remove the Apple Backup archive files from the hard disk by dragging them into the Trash.

If you have problems with either of these workarounds, contact the Apple Assistance Center at 1-800-SOS-APPL (767-2775).

Reformatting the MS-DOS Disks

If you don’t need to do a restore, then you can reformat the DOS disks by selecting Erase Disk from the Special Menu. If PC Exchange is loaded at the time, you are given an option of how you want the disks formatted. Choose the Macintosh disk option. If you have questions about using PC Exchange, read the "Macintosh PC Exchange User’s Guide" that came with your computer.

Performa 450: PC-Style 72-pin RAM SIMM Socket (6/93)

Revised: 6/24/93
Security: Everyone

Performa 450: PC-Style 72-pin RAM SIMM Socket (6/93)

==========

Article Created: 16 June 1993

TOPIC --------------------

Can I use the same RAM (random access memory) SIMMs with a Performa 450 that DOS personal computers use, or must I use a special SIMM? Does the speed of the SIMMs have to be 70ns or 80ns?

DISCUSSION --------------------

Unlike the Performa 400, the Performa 450 comes with a single 72-pin PC-style SIMM socket. Apple chose to implement the single 72-pin RAM SIMM socket because of the greater availability of these SIMMs. When purchasing SIMMs, be sure you get 72-pin fast-paged mode with 80ns access time or faster. Of course, if your DOS computer uses 72-pin 80ns or faster SIMMs, you are free to use them in your Performa 450.

Performa: DOS Compatibility and PC Exchange (3/94)

==========

Article Created: 16 June 1993
Article Reviewed/Updated: 25 March 1994

TOPIC ----------

I recently purchased a Macintosh Performa and I understand it is DOS compatible. Please explain the DOS compatibility part.

DISCUSSION ----------

The Performa 430 comes with a software "control panel" called PC Exchange. This control panel enables the Performa to recognize DOS disks when they're inserted into the computer. While this alone does not allow you to run DOS programs on your Performa, it does allow you to insert a DOS formatted disk into the Performa and read the data on the disk. This function is automatic; you don't have to do anything else.

As an example, let's say you have created a WordPerfect document on your IBM PC (or compatible) at work, and you want to bring it home. All you need to do is copy the document (no need to copy the entire WordPerfect application) to a 3.5-inch DOS-formatted floppy disk. When you insert the DOS formatted disk into your Performa computer, the disk icon appears on your desktop with the letters PC on it. You can then double-click the disk icon, and a window opens showing you the WordPerfect document. You can then open the document from any Macintosh program that reads WordPerfect PC files.

If your desire is to run DOS applications on your Macintosh, you can purchase an additional program like SoftPC. For more information, search the Apple Tech Info Library using "SoftPC" as your search string.

ABS Tech Note: SNA•ps18 V25bis Autodialing (4/93)

Revised: 9/7/93
Security: Everyone

ABS Tech Note: SNA•ps18 V25bis Autodialing (4/93)

==========

Article Created: 29 April 1993

TOPIC ----------

This technical note describes the use and configuration of the SNA•ps V.25bis autodial feature for both the Hayes Ultra 96 and Codex 2264 modems.

DISCUSSION ----------

Introduction

The SNA•ps gateway has an autodial capability whereby a number specified in the SNA•ps configuration is automatically dialed whenever the gateway line and partner are activated. SNA•ps uses the V.25bis protocol to communicate to the modem the number to dial. V.25bis is a communication standard specifying a means of initiating communications synchronously over switched telephone networks. SNA•ps is specific in that it requires synchronous high level data link control (HDLC), addressed mode, with the EBCDIC character set, and the modem must be configured accordingly.

This technical note describes the use of this feature with both the Hayes Ultra 96 and the Codex 2264 modem.

SNA•ps SDLC line parameters

Differences exist in the way modem manufacturers implement V.25bis. For this reason, it is important to carefully review the documentation for the specific modem being used.

For instance, the Hayes Ultra 9600 modem does not allow dashes in the dial string, while the Codex 2264 does.

With both the Hayes and Codex modems, the SNA•ps SDLC line must be NRZ (no NRZI) setting. SNA•ps supports both half duplex and full duplex operation for either modem.

Modem settings

Set the Hayes dip switch 3 down and 1, 2, and 4 up, V.25bis works fine in this configuration. However, attempting to set register s94=10 using the Hayes AT commands (which according to the documentation and Hayes support staff should be functionally equivalent to setting the dip switches as above) proved unsuccessful.

For the Codex, use the settings outlined in the technical note SNA•ps06 - Modem Configuration.

The Codex modem has a parameter to specify PULSE/TONE dialing when using V.25bis. For the Hayes, use an asynchronous modem connection and send the ATT&W command to the modem in order to specify tone dialing (pulse is the default).

SNA•ps line trace

The SNA•ps line trace facility doesn't show all the V.25bis flows. Some frames returned from the modem (e.g. INV - invalid, VAL - valid, etc.) don't appear. For this reason, it is recommended to use an external line monitor (e.g. HP 4953A or equivalent) when troubleshooting V.25bis.

Other features

SNA•ps sends EBCDIC V.25bis commands. This is not a problem for modems with configurable character sets (Hayes and Codex support both EBCDIC and ASCII).

Full duplex switched connections (V.32) were successfully tested for both modems. However, in the event of problems with full duplex operation (for modems not specifically mentioned in this technical note), try re-configuring the SNA•ps gateway for half duplex operation.

Call failure responses, which the modem will send to the gateway if the call is unsuccessful, are not currently supported. For example, CFIET (busy tone detected) or CFIAB (modem aborted call) when returned from the modem will necessitate restarting the gateway. The symptom is that the SNA•ps line can not be deactivated. Further, deactivating and reactivating the SNA•ps partner will not cause the stored number to be re-dialed. The gateway must be re-started in this instance.

ABS Tech Note: SNA•ps19 System Heap Fragmentation (5/93)

Revised: 9/7/93
Security: Everyone

ABS Tech Note: SNA•ps19 System Heap Fragmentation (5/93)

==========

Article Created: 24 May 1993

TOPIC

This Technical Note describes problems which may occur in a system where the system heap cannot grow because of memory fragmentation.

DISCUSSION

Introduction

The SNA•ps Gateway uses the Macintosh system heap to dynamically allocate space for data structures. These data structures are used to manage the connections between the SNA•ps clients and gateway. If the data structures cannot be created, then no new connections can be opened to the gateway, until more memory becomes available.

Memory can become available in two ways. Either memory that was previously in use is released, and can be reused by the SNA•ps Gateway, or the system can increase the size of the system heap.

Under normal conditions, the system heap can grow to handle the increased need for memory space. In some situations it cannot. This can occur even though the machine has memory available. The system heap can only grow into memory that is contiguous with the existing system heap. If an application is occupying memory that is adjacent to the system heap, the heap will not be able to grow. The SNA•ps Gateway will be not be allowed to dynamically allocate memory for new connections until the application exits and frees up contiguous memory space.

Example of the Problem

If the following error message or a similar message is received when trying to make a SNA•ps Gateway connection and there should be more Gateway connections available the problem may be caused by the Macintosh system heap fragmentation.

"Sorry, there are too many clients connected to the gateway already. Please try again, or run SNA•ps Admin on the gateway machine".

If this error is caused by Macintosh system heap fragmentation the solution is to quit the application in low memory. Determining the application in low memory may be difficult, if you are unable to you may have to quit all other applications make the Gateway connection and then start up the applications.

ABS Tech Note: SNA•ps21 Serial NB Card & Duo Dock (3/95)

Revised: 3/22/95
Security: Everyone

ABS Tech Note: SNA•ps21 Serial NB Card & Duo Dock (3/95)

==========

Article Created: 24 May 1993
Article Reviewed/Updated: 22 March 1995

TOPIC

This Technical Note describes problems which may occur when using the Serial Nubus Card in a Duo Dock.

DISCUSSION

Introduction

The Macintosh Slot Manager sometimes does not recognize the presence of a Serial Nubus Card in the Nubus expansion slot of the Duo Dock.

For Macintosh Applications

If the Serial Nubus Card is not recognized by the slot manager, applications that use the card will not know that it is present, and users will not be able to configure the software to run on the card.

Example

The SNA•ps Admin will not be able to find the Serial Nubus Card and the SNA•ps Gateway can not be configured and loaded.

Macintosh LC 520: Configurations (6/93)

==========

Article Created: 28 June 1993

TOPIC -----

At the time of introduction, three configurations of the Macintosh LC 520 will be available. This article describes them.

DISCUSSION -----

The first configuration is an entry-level system targeted for those customers who are buying in large quantities and don't need all of the manuals and disk sets.

The other two configurations are bundled with the standard keyboard, additional RAM, disks, and manuals.

Macintosh LC 520 5/80/CD

5MB RAM (4MB on logic board, 1MB in RAM SIMM)
768K VRAM, 16-bit color
1.4MB SuperDrive
80MB hard drive
AppleCD 300i
Mouse
System software installed on hard drive
• Keyboard, System Software back-up disks, and manuals sold separately

Macintosh LC 520 8/80/CD (Canada Only)

5MB RAM (4MB on logic board, 1MB in RAM SIMM)
768K VRAM, 16-bit color
1.4MB SuperDrive
80MB hard drive
AppleCD 300i
Mouse
System software installed on hard drive

System Software back-up on bootable CD
All manuals
• Keyboard sold separately in USA Education channel

Macintosh LC 520 8/160/CD (Canada and Japan)

5MB RAM (4MB on logic board, 1MB in RAM SIMM)
768K VRAM, 16-bit color
1.4MB SuperDrive
160MB hard drive
AppleCD 300i
Mouse
System software installed on hard drive
System software back-up on bootable CD

Macintosh LC 520: Logic Board Features (6/93)

Revised: 6/24/93
Security: Everyone

Macintosh LC 520: Logic Board Features (6/93)

==========

Article Created: 28 June 1993

TOPIC ----------

This article is an overview of the Macintosh LC 520's logic board, with references to some other Macintosh models.

DISCUSSION ----------

Like the Macintosh LC III, the Macintosh LC 520 uses a 25 MHz 68030 processor (with an optional 25 MHz 68882 floating point coprocessor) and uses a full 32-bit wide data bus. Combined, these features provide approximately twice the performance of the Macintosh LC II.

The Macintosh LC 520 uses the same 114-pin 68030 Processor Direct Slot (PDS) used by Macintosh LC III. This PDS slot has a special cutout that maintains compatibility with the 96-pin PDS cards designed for the Macintosh LC and LC II.

The Macintosh LC 520 comes with 4MB of RAM soldered on the logic board, plus 1MB in the 72-pin SIMM socket. Additional RAM SIMMs are available in 1MB, 2MB, 4MB, 8MB, 16MB, and 32MB capacities, for RAM expansion up to 36MB. SIMMs must be 72-pin past-paged mode, 80ns or faster.

Expansion is made easy through the use of a slide-out logic board, similar to the Macintosh Color Classic. Upgrading to a larger-capacity hard drive, for example, involves removing the bezel, sliding out the old drive, and sliding in the new drive. (You need the appropriate mounting bracket from the drive's manufacturer.)

Macintosh LC 520: Overview (6/93)

Revised: 6/30/93
Security: Everyone

Macintosh LC 520: Overview (6/93)

==========

Article Created: 28 June 1993

TOPIC ----------

The Macintosh LC 520 is an all-in-one computer design that combines the Macintosh Color Classic's ease of setup and use with the performance of the Macintosh LC III.

DISCUSSION ----------

Markets

Targeted primarily at the US education market, the Macintosh LC 520 is designed to meet the needs of schools looking for superior ease of setup and use, full-screen color, multimedia capability, and an affordable price.

Memory and Storage

The Macintosh LC 520 comes with 5MB of DRAM, with expansion up to 36MB possible.

Hard drive options include 80MB and 160MB capacities.

Multimedia

The Macintosh LC 520 provides built-in superior multimedia support through the use of a 14-inch Trinitron display, integrated stereo speakers, a standard double-speed AppleCD 300i, and a built-in microphone.

The Macintosh LC 520 features a built-in microphone for easy sound annotation and push-buttons on the front panel to control volume and screen contrast. Software power control, on and off, is supported from the keyboard.

Expansion and Upgrades

Like the Macintosh LC III, the Macintosh LC 520 contains an LC-compatible PDS slot to support cards designed for the Macintosh LC, LC II, and LC III, including the Apple IIe card and the Apple Ethernet LC card.

The main logic board and drives can be accessed or replaced easily by opening a bezel and sliding the part out.

Energy Conservation

The Macintosh LC 520 conforms to Apple Computer's power reduction goals and meets the EPA Energy Star requirements for computers. Similar to the Sleep function on PowerBook computers, when its not in use for a definable period, the Macintosh LC 520 goes into a reduced power mode, dimming the screen and resulting in 50% less power consumption. This feature also doubles as an effective screen saver.

Macintosh LC 520: Power Controls and Energy Conservation (6/93)

Revised: 6/24/93
Security: Everyone

Macintosh LC 520: Power Controls and Energy Conservation (6/93)

==========

Article Created: 28 June 1993

TOPIC ----------

This article discusses the power controls on the Macintosh LC 520 computer system.

DISCUSSION ----------

Powering On and Off

Like the Macintosh Color Classic, the Macintosh LC 520 supports both power on and power off from the keyboard. When you first unpack the system, and the power switch on the read is turned on, the system does not start up. You must also press the power key on the keyboard. After that, you'll power-on and -off the system from the keyboard.

The master switch on the back can be left on -- unless the system will be turned off for an extended length of time, or if the logic board is to be removed.

IMPORTANT: Before removing the logic board, turn off the rear power switch, otherwise power will remain active on the board, resulting in danger of a short.

Energy Saving

An energy-saving feature allows users to set the length of time that the Macintosh can be idle before power to the screen is shut off. This feature is activated through the Screen control panel.

When the screen is powered down, total system energy consumption is reduced by approximately 50%. Power to the screen is restored when either the mouse button or a key is pressed. This feature allows the Macintosh LC 520 to meet the EPA's Energy Star conservation standards.

One Outlet Is Enough

Because of its all-in-one design, the Macintosh LC 520 needs only one AC outlet -- for the computer, display, CD-ROM player, disk drives, and loudspeakers.

Macintosh LC 520: Specifications (8/95)

==========

Article Created: 28 June 1993
Article Reviewed/Updated: 03 August 1995

TOPIC ----------

This article gives technical specifications for the Macintosh LC 520 computer.

DISCUSSION ----------

Microprocessor

- MC68030, 25 MHz clock speed; 32-bit data bus
- Built-in memory-management unit
- Socket for optional MC68882 floating-point unit (FPU)

Memory

- 4MB RAM on logic board
- Expandable (by authorized Apple dealer) to as much as 36MB by adding 1MB, 2MB, 4MB, 8MB, 16MB, or 32MB SIMM to a single 72-pin slot. Requirement: 72-pin fast-paged, 80ns or faster.
- 1MB ROM

Disk Drives

- One built-in Apple SuperDrive 1.4MB floppy disk drive
- One internal 80MB or 160MB hard disk
- Internal AppleCD 300i double-speed CD-ROM drive

Video Display

- Integrated Macintosh Color Display with 14-inch Trinitron CRT
- Resolution: 640 x 480 pixels, 69 dpi
- 768K VRAM supports 32,768 colors (16-bit color)

Interfaces

- Internal expansion slot for one Macintosh LC processor-direct expansion card. Compatible with Apple IIe Card.
- SCSI interface for connecting up to five external peripheral devices
- Two serial (RS-232/RS-422) ports
- One stereo sound-output port for external audio amplifier or headphones
- Two Apple Desktop Bus (ADB) ports for keyboard, mouse, and other devices
- Front headphone jack
- Built-in electret microphone above display
- One sound-input port for four sources: included internal microphone, or external Plaintalk Microphone, internal CD-ROM, or other external audio source

Sound Generator

- Stereo 8-bit digital-analog conversion using 22-kHz sample rate - capable of driving stereo headphones or other stereo equipment through the sound jack and headphone jack
- Built-in stereo speakers

Keyboard and Mouse

- ADB Mouse II
- Keyboard purchased separately only in the K-12 configuration; several ADB keyboards with numeric keypads available

Clock/Calendar

- Custom integrated circuit with long-life lithium battery

Disability Access

- CloseView, Easy Access, and visible-beep software are built in.
- Third-party options provide alternative input and output devices

Power Requirements

- Line voltage: 90 to 264 V AC, RMS single phase, automatically configured
- Frequency: 47 to 63 Hz
- Power: 40 W maximum, not including display
  60 W maximum, including display
- Energy-saving feature reduces power consumption by 50%
- One AC outlet powers computer, display, drives, and speakers

ADB Power Requirements

- Maximum current draw for all ADB devices: 500 mA (three ADB devices maximum is recommended)
- Mouse draws 10 mA
- Keyboard draws 25 to 80 mA, depending model used

Size and Weight

Main unit:
- Height: 17.9 in. (45.5 cm)
- Width: 13.5 in. (34.4 cm)
- Depth: 16.5 in. (42.0 cm)
- Weight: 40.5 lbs (18.4 kg)

Mouse:
- Height: 1.3 in. (3.3 cm)
- Width: 2.4 in. (6.2 cm)
- Depth: 4.2 in. (10.7 cm)
- Weight: 4.0 oz. (0.10 kg)

Operating Environment

- Operating temperature: 50 to 104° F (10 to 40° C)
- Storage temperature: –40 to 116.6° F (–40 to 47° C)
- Relative humidity: 20% to 85% noncondensing
- Maximum altitude: 15,000 ft. (4,722 m)

System Software Requirements

Requires System 7.1 or later and the System Enabler 403.

Article Change History:
03 Aug 1995 - Added Plaintalk Microphone information.

Macintosh LC 520: Video and Sound Features (6/93)

Revised: 6/30/93
Security: Everyone

Macintosh LC 520: Video and Sound Features (6/93)

==========

Article Created: 28 June 1993

TOPIC ----------

This article introduces the video and sound features of the Macintosh LC 520 computer system.

DISCUSSION ----------

Video

The Macintosh LC 520 includes a built-in 14-inch Trinitron color display, which is functionally equivalent to Apple's standard 14" Macintosh Color Display.

768K of VRAM provides:
• 640 by 480 pixels, at 16 bits per pixel
• 32,768 colors

Contrast is controlled with the front panel pushbuttons, or through the Screen control panel. Screen brightness is controlled through the Screen control panel. It shouldn't be necessary to modify the screen brightness on a new picture tube.

The Macintosh LC 520 does not support external displays.

Sound

The Macintosh LC 520 provides built-in stereo sound output through two amplified speakers in the front of the chassis. There are also two sound output jacks, one in front and one in the rear.

Sounds generated by the computer itself are monaural, but stereo sounds from external sources -- and from the built-in AppleCD 300i -- are stereo.

Sound input is accomplished with the built-in microphone, by plugging a

microphone or other line-input device into the sound input port, or directly from a compact disc in the built-in AppleCD 300i.

To record sound, use the Sound control panel. While the default sound input device is the internal microphone, choosing Options allows users to choose alternative inputs.

Sound volume is controlled from either the front panel pushbuttons, or through the Sound control panel. You can control CD volume from the Apple CD Audio Player, an application that ships with the Macintosh LC 520.

Macintosh Color Classic and LC Family Compared (7/93)

==========

Article Created: 28 June 1993
Article Reviewed/Updated: 12 July 1993

TOPIC ----------

Because of its all-in-one design, the Macintosh LC 520 resembles the Macintosh Color Classic as much as it resembles the other models in the LC series.

This article compares the key features of four Macintosh models: the Color Classic, LC II, LC III, and LC 520.

DISCUSSION ----------

	Color Classic	LC II	LC III	LC 520
68030 Speed	16 MHz	16 MHz	25 MHz	25 MHz
Data Bus	16-bit	16-bit	32-bit	32-bit
RAM	4-10MB	4-10MB	4-36MB	4-36MB
Display	built-in 10" Trinitron	12" & 14" VGA, RGB	12", 14", 16" VGA, Portrait	Built-in 14" Trinitron
Display	to 16-bit	8-bit on 14"	to 16-bit on 14"	16-bit
Sound Output	mono	mono	mono	stereo
CD-ROM drive	optional external	optional external	optional external	standard internal
Microphone	built-in	optional external	optional external	built-in

NOTE: Use the LC II and LC III columns to compare the Performa 400, 405, and 430 to the Performa 450.

AppleShare Copy Volume Limitation (6/93)

Revised: 6/23/93
Security: Everyone

AppleShare Copy Volume Limitation (6/93)

==========

Article Created: 23 June 1993

TOPIC ----------

The Copy Volume feature of AppleShare 3.0 Admin doesn't seem to work when the target volume is a server (the copy button turns gray). It works fine when the target is a local hard drive. Is this the way it should work?

DISCUSSION ----------

The "Copy <item> to..." menu item in the Privileges menu won't copy files to non-local volumes. Unfortunately, this isn't made clear in the "AppleShare 3.0 Administrator's Guide."

The purpose of the "Copy <item> to..." menu item is to copy files to another volume while maintaining the access privileges. It isn't possible for the "Copy <item> to..." menu item to do this when copying files to an AFP server. The files copied would be given new privileges.

Quadra 950 to Apple Workgroup Server 95 Upgrade (11/94)

Revised: 11/11/94
Security: Everyone

Quadra 950 to Apple Workgroup Server 95 Upgrade (11/94)

==========

Article Created: 22 June 1993
Article Reviewed/Updated: 11 November 1994

TOPIC ----------

I'm confused about a Quadra 950 to Apple Workgroup Server 95 upgrade.

1) Once I've installed a PDS card into a Quadra 950, can I swap out the memory for parity RAM or do I continue to use regular memory?

2) Is A/UX included with the PDS card? To run AppleShare Pro do I need to buy only AppleShare Pro or AppleShare Pro plus A/UX?

3) Will I have problems using a 3rd Party CD-ROM player to install A/UX? Do I need to use an Apple CD-ROM drive?

DISCUSSION ----------

To answer your questions:

1) You can do either, you can continue to use 8 bit standard RAM or upgrade the system to 9 bit parity RAM.

2) Yes, A/UX 3.0.1 is included with the PDS card updgrade, below is a detailed list of upgrade option information.

   Ordering Information For Upgrade Kits And Accessory Kits

   Apple Workgroup Server PDS Card Upgrade Kit*
   Order No. M6940Z/A
   - Processor-direct slot card for the Macintosh Quadra 900 or 950 (128K second-level memory cache on-board)
   - System software installer CD-ROM (one-button installation of system software, Apple documentation viewer and Retrospect Remote backup software

- Complete documentation
- Limited warranty statement
- CPU labels

Apple Workgroup Server PDS Card/DDS-DC Drive Upgrade Kit*
Order No. M6945Z/A

- Processor-direct slot card for the Macintosh Quadra 900 or 950 (128K second-level cache on-board)
- Internal digital data storage-data compression (DDS-DC) 4mm tape backup drive
- All other features included with the Apple Workgroup Server PDS Card Upgrade Kit for the Macintosh Quadra 900 or 950

* These kits upgrade a Macintosh Quadra 900 or 950 to an Apple Workgroup Server 95. A CD-ROM drive is required to install system software.

Apple Workgroup Server 95 128KB/Tag Second-Level Memory Cache Upgrade Kit Order No. M6810Z/A
Adds an additional 128K and Tag second-level 68040 memory cache to the PDS card, for a total of 256K of second-level memory cache.

Apple Workgroup Server 95 256KB Second-Level Memory Cache Upgrade Kit
Order No. M6815Z/A
Adds an additional 256K of second-level 68040 memory cache to the PDS card for a total of 512K second-level memory (Requires installation of 128KB/Tag kit).

Apple Workgroup Server 95 16MB Parity DRAM Upgrade Kit
Order No. M6820Z/A
Adds 16MB of parity DRAM to the Apple Workgroup Server 95.

Blank DDS Tape 5 Pak
Order No. M2092Z/A
Blank DDS tape for use with internal DDS-DC drive.(Tape uses the Media Recognition System (MRS) standard.)

3) You can use some 3rd party CD-ROM drives to install A/UX and/or the AppleShare Pro software. Although you may be able to install A/UX, you might later run into compatibility issues when attempting to use the drive under the Macintosh environment. Unfortunately there is no complete list of compatible CD-ROM drives, below is some information on "compatible" drives.

Results from A/UX third-party hardware compatibility testing show that the NEC BFU-35 CD-ROM drive does not work under A/UX versions 1.0, 2.0 or 3.0. The NEC 35 CD-ROM does not support the SCSI command "Mode Select".

Chinon CD-ROM CDA 431 drive works fine under A/UX and System 7.x.

Toshiba TXM 3201A1 CD-ROM drive works under A/UX, but not System 7.x.

Most CD-ROM drives that utilize a Sony mechanism will function under both the Macintosh OS and under A/UX.

LaserWriter Utility 7.4: Not Seeing Modified Print Driver 6/93

Revised: 6/24/93
Security: Everyone

LaserWriter Utility 7.4: Not Seeing Modified Print Driver 6/93

==========

Article Created: 24 June 1993

TOPIC -----

I have set up a color PostScript printer on a network so that only a few users can see it.

I achieved this by setting the "appletalktype" parameter in the printer to something other than "LaserWriter," and modifying the 'STR' resource ID# -4096 in the LaserWriter extension accordingly. After renaming and installing the modified driver, only computers with this modified driver can use the printer.

This works fine, but now my LaserWriter Utility 7.4 no longer sees it. Which resource ID do I need to change to correct this?

DISCUSSION -----

The only resource you need to change in the LaserWriter driver is the 'STR' resource ID# -4096. This is where the Chooser gets the AppleTalk type for the NBP (Name Binding Protocol) lookup. After the printer has been selected, the Chooser writes the printer's name, AppleTalk type, and AppleTalk zone to 'PAPA' resource ID# -8192 in the LaserWriter driver.

There is nothing that needs to be changed in the LaserWriter Utility. The LaserWriter Utility looks at the 'PAPA' resource ID# -8192 in the currently selected LaserWriter driver to determine how to do an NBP lookup for the selected LaserWriter. The contents of the 'STR' resource should like something like this:

Name Some LaserWriter
Type LaserShared
Zone SCV CAM2 2nd W.

If the LaserWriter 8.0 driver is being used, the LaserWriter Utility 7.4.1 must be used or the following error message is displayed:

"The currently selected printer is not a LaserWriter. Please select a LaserWriter with the Chooser."

LaserWriter Utility versions prior to LaserWriter Utility 7.4.1 would not look in the selected printer driver if the creator was something other than 'LWRW'. The LaserWriter 8.0 driver has a creator of 'vgrd'. The LaserWriter Utility 7.4.1 will use printer drivers with creators of 'LWRW' or 'vgrd'.

Apple Media Kit: Description (2/95)

Revised: 6/5/96
Security: Everyone

Apple Media Kit: Description (2/95)

==========

Article Created: 23 June 1993
Article Reviewed/Updated: 10 February 1995

TOPIC ----------

The Apple Media Kit is a multimedia authoring and digital publishing tool. Products developed with the Apple Media Kit use QuickTime to play back on Macintosh computers and on computers using Microsoft Windows.

DISCUSSION ----------

The Apple Media Kit includes two tools:

• The Apple Media Tool

• The Apple Media Tool Programming Environment

Both tools are designed to work together for cross-platform multimedia development.

The Apple Media Tool

Here are some features of the Apple Media Tool:

• Lets you assemble media elements and add interactive features without writing any code.

• Uses object-based authoring, for rapid creation of prototypes using rough-draft media elements.

• Preserves interactive connections when finished media elements are substituted for rough-draft media elements.

• Optimizes hard disk-based and CD-ROM-based projects.

• Lets you author on Macintosh and simultaneously deliver projects on Macintosh

and Microsoft Windows systems.

Apple Media Tool Programming Environment

Features of the Apple Media Tool Programming Environment:

• Combines the power of an object-oriented programming language with the ease of use of a scripting language.

• Makes project code portable between Macintosh and Intel-standard computers running Microsoft Windows.

• Gives access to both Macintosh and Microsoft Windows toolboxes through a C-language interface.

• Includes both a new programming language and a new application framework.

Travelrama: Description (12/95)

Revised: 12/22/95
Security: Everyone

Travelrama: Description (12/95)

==========

Article Created: 23 June 1993
Article Reviewed/Updated: 22 December 1995

TOPIC ----------

This article describes Travelrama, CD-ROM based entertainment software.

DISCUSSION ----------

Travelrama is CD-ROM based entertainment software for ages nine to adult. It is a multi-player game where each player "travels" across the US collecting postcards and learning geography at the same time. Each player can adjust their individual level of play.

Travelrama was originally distributed and supported by Apple Computer's StarCore group. Customers that acquired Travelrama from StarCore or received it bundled with an Apple product can still receive up and running technical support from Apple Computer's Applications support group at 800-767-2775 (800-SOS-APPL).

Apple Computer no longer distributes TravelRama, however, customers can purchase it from Zenda Studios. Zenda Studios provides technical support to those customers that purchase the software from them.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

Article Change History:
22 Dec 1995 - Added Zenda Studios information.
30 Nov 1995 - Corrected minor typo.

Wacky Jack’s CD Game Show: Description (6/93)

==========

Article Created: 23 June 1993

TOPIC --------------------

This article describes Wacky Jack’s CD Game Show, CD-ROM based entertainment software.
.
DISCUSSION --------------------

Wacky Jack’s CD Game Show is CD-ROM based entertainment software for ages eight to adult. It takes the form of a multi-player game show which includes four separate games: picture-matching, tic-tac-toe/trivia, picture-puzzle and hangman.

Players can select their own play levels and have help available at any time.

New games will be included in future editions.

System Software Version and NSI Compatibility (6/93)

Revised: 6/23/93
Security: Everyone

System Software Version and NSI Compatibility (6/93)

==========

Article Created: 15 June 1993

TOPIC ----------

I can't find anything that says it's okay to install new versions of AppleTalk of machines running older systems. Everything I've found vaguely implies that it's okay by saying "Apple recommends using the latest version supplied on Network Software Installer (NSI) version (whatever)".

Are there minimum system requirements for NSI 1.2.3, 1.3, or 1.3.2?

DISCUSSION ----------

Apple currently supports using the N.S.I (all versions of the N.S.I. through 1.3.2.) on Macintosh Operating System versions 6.0.5 and higher. Using N.S.I. to update network components on versions of the operating system previous to 6.0.5 is not supported by Apple.

Macintosh LC 520: Using CD-ROM As Startup Volume (6/93)

==========

Article Created: 28 June 1993

TOPIC -----

Can I start up my Macintosh LC 520 from a CD-ROM in the built-in AppleCD 300i?

DISCUSSION -----

Technically, yes you can. However, Macintosh system software is not designed to operate properly from a locked volume such as a CD-ROM.

Start up from a CD-ROM only when you're installing or upgrading system software.

Apple Workgroup Server 95: NFS Conflict (6/93)

Revised: 6/24/93
Security: Everyone

Apple Workgroup Server 95: NFS Conflict (6/93)

==========

Article Created: 23 June 1993

TOPIC ----------

Whenever a Macintosh client modifies a file on the Apple Workgroup Server (AWS) 95 the file's UNIX privileges are set to "root". This means that any NFS user not logged in as root will not be able to use the file. In mixed environments of Macintosh, UNIX, and PCs this is a show stopper. No work around has been found since AppleShare Pro must run from the root level in order to operate. Is there a way that we can force the AppleShare Pro to leave the privileges alone?

DISCUSSION ----------

The privileges are not set exactly as you have explained. The UNIX privileges are set up as follows:

directories: drwxr_xr_x
files: _rw_r__r__

The owner is root and the group is root.

This does not allow other UNIX based users to write to these files but it does allow them to open and view the directories and files. The NFS based user would then be able to save a modified copy to any directory to which they have write privileges.

The good news is there is an easy way to modify the way AppleShare Pro sets the UNIX permissions. By modifying the value of the umask you can set up the privileges to a more suitable mode. Since the root account starts a Bourne shell (sh) by default you can modify the umask value in the /.profile file. If you changed the root account to start the C-Shell (csh) you could modify the value of the umask in the /.login file. The umask is an octal value used as a mask to set file privileges when certain system

calls (creat(), mknod(), and open()) are made by a user process.

The umask value controls which bits are used to set the privileges when directories and files are created. A value of 000 would not mask any bits resulting in a file/dir creation with privileges set to 777 (rwxrwxrwx). You need to set this value in the .profile or .login files to the appropriate value for the environment, quit AppleShare (if running), and logout. Login and start the AppleShare server and the new creation privileges will now be exported to the AppleShare application environment.

LaserWriter Driver 8.0: A4 errors in LaserWriter PPD (6/93)

Revised: 6/24/93
Security: Everyone

LaserWriter Driver 8.0: A4 errors in LaserWriter PPD (6/93)

==========

Article Created: 24 June 1993

TOPIC ----------

Previously, I had no problem printing to an original LaserWriter with an "A4" cassette using LaserWriter driver 7.1.2. I have since upgraded to LaserWriter driver version 8.0 and now there isn't an "A4" cassette option in Page Setup. I am using the "LaserWriter" PPD (PostScript Printer Description) file.

As a workaround, I manually select the PPD file in the LaserWriter 8.0 driver, and click "Use Generic." I am able to select the "A4" paper size in the Page Setup dialog box, however, if I close the Page Setup dialog box and reopen it, the paper size indicated is "Other" and not "A4". Why?

DISCUSSION ----------

The fundamental problem here is that the "A4" paper size is not included in the "LaserWriter" PPD as an option. We have reported this as a bug to engineering.

We were also able to verify the problem with "A4" switching to "Other" in Page Setup while using the Generic PPD. This has been reported to engineering as a separate bug. Upon speaking with engineering, "Other" is being substituted because of an anomaly between the driver and the PPD on the A4 page specification.

Until these bugs are fixed, a suggestion would be to use the Generic PPD (ignoring that "Other" is substitued) or use the LaserWriter 7.1.2 driver.

LaserWriter Pro: Energy Star Software (6/93)

Revised: 6/25/93
Security: Everyone

LaserWriter Pro: Energy Star Software (6/93)

==========

Article Created: 25 June 1993

TOPIC ----------

What is the Energy Star software for the LaserWriter Pro printers?

DISCUSSION ----------

The LaserWriter Pro Software Upgrade, otherwise known as the Energy Star software for the LaserWriter Pro, gives the LaserWriter Pro 600 and 630 printers the energy-saving capability to meet the requirements of the Environmental Protection Agency's Energy Star program. Once users install this upgrade on a LaserWriter Pro 600 or 630 printer, it meets Energy Star requirements.

This software consists of a LaserWriter Utility v7.4.1 and a set of files which put the LaserWriter Pro into "sleep mode" after predetermined lengths of time. Sleep mode is a low-power state in which the LaserWriter Pro will use approximately 70% less power than normal idle mode.

Note that this software ONLY works on the LaserWriter Pro 600 and 630 printers.

You can find the software on Applelink by following this path:

Software Sampler
 Apple SW Updates
  Macintosh
   Printing Software

How to set sleep mode

To set the period of time before the LaserWriter Pro printer goes to sleep, perform the following steps:

1) Select the desired printer in the Chooser.

2) Double-click on the LaserWriter Utility icon.

3) Select “Download PostScript File...” from the “Utilities” menu.

4) Double-click on the sleep mode file corresponding to the length of time you would like the LaserWriter Pro printer to wait before going to sleep. For example, to select 30 minutes, double-click on the file named “30 Minute Sleep Mode.”

5) The next dialog asks you to “Save PostScript output” as a file. For most users, the default name “PostScript Log” is acceptable, so just click on the “Save.” If you have previously set sleep mode, another dialog box will appear asking if you would like to “Replace” or “Cancel”. Click on Replace.

6) After the file is downloaded, you MUST RESTART THE PRINTER for the changes to take effect.

7) If you would like to verify that the file downloaded properly, you can look at the PostScript™ Log file (using something like TeachText) and it should contain a statement similar to: "Engine sleep timeout changed to .5 hours.”

You have now set the sleep mode on the LaserWriter Pro printer. After the printer has not printed for the length of time you have set, the printer will go to sleep. Note that it takes approximately 30 seconds for the printer to warm up, so the first page you send when the printer is sleeping will take approximately 30 seconds longer to print than when not in sleep mode.

Apple Workgroup Server 95: RAID Drives and Mirroring (1/94)

Revised: 1/5/94
Security: Everyone

Apple Workgroup Server 95: RAID Drives and Mirroring (1/94)

==========

Article Created: 23 June 1993
Article Reviewed/Updated: 5 January 1994

TOPIC ----------

I want to purchase the new Apple Workgroup Server (AWS) 95. I want to use five mirrored hard drives (that's a total of 10 physical hard drives). First is this a problem, and second who makes these drives? I know the drives must be A/UX compatible, and have mirroring capability. Could you please suggest drive vendors making drives to meet my requirements.

Also which version of A/UX is shipped with the AWS 95?

DISCUSSION ----------

As of December, 1993 the AWS 95 is shipped with A/UX 3.0.2.

Yes, it is possible to have five mirrored hard drives (total of 10 physical hard drives) within an AWS 95. In theory, a total of 28 (seven drives for the four SCSI Buses) hard drives can be connected to an AWS 95. However since SCSI ID 0 is reserved for Macintosh, and eight drives are the maximum that can be placed inside the computer via the two internal SCSI Buses, the practical total number of physical hard disk drives is 20 (8 + (6 x 2)).

The AWS 95 is capable of supporting disk mirroring. However, the third-party disk manufactures have to provide drives which implement the Redundant Array of Inexpensive Disks (RAID) level 1 disk mirroring technology in the drive.

Below is a partial list of RAID providers for the AWS 95, you should contact them directly. To locate a vendor's address and phone number, use the vendor name as a search string.

- Ciprico Inc.
  Servers supported: AWS 95, AWS 80, AWS 60
  RAID products: Rimfire Series 6700 Disk Array

- Conley Corporation
  Servers supported: AWS 95, AWS 80, AWS 60
  RAID products: SR1/SR2 Fault-Tolerant SCSI Disk Arrays

- CORE International
  Servers supported: AWS 95, AWS 80, AWS 60
  RAID products: MicroArray 510, MicroArray 840, MicroArray 1300,
  LANArray 2000, LANArray 4000

- FWB Software, Inc.
  Servers supported: AWS 95, AWS 80, AWS 60
  RAID products: SledgeHammer A/UX Disk Arrays

- MegaDrive
  Servers supported: AWS 95, AWS 80, AWS 60
  RAID products: MegaDrive MR-10

The following partial list of RAID providers are for the AWS 80 and AWS 60, you should contact them directly. To locate a vendor's address and phone number, use the vendor name as a search string.

- MASS Microsystems
  Servers supported: AWS 80, AWS 60
  RAID products: MASSterArray

- MicroNet Technology, Inc.
  Servers supported: AWS 80, AWS 60
  RAID products: RAVEN.040 Disk Array

Portable StyleWriter: Description (5/95)

Revised: 5/23/95
Security: Everyone

Portable StyleWriter: Description (5/95)

==========

Article Created: 28 June 1993

TOPIC ----------

This article describes the Portable StyleWriter printer.

DESCRIPTION ----------

The Portable StyleWriter is the printer that goes anywhere, weighing in at 4.5 pounds. It offers 360 dots-per-inch print resolution, is whisper-quiet, and works with any PowerBook, PowerBook Duo, or Macintosh computer, using a rechargeable battery or a standard power source.

It comes with 39 TrueType scalable fonts and prints on a wide selection of media, including envelopes, labels, transparencies, letterhead, and plain paper . To simplify paper handling, a manual paper feeder is built in and an optional 50-sheet automatic feeder makes it easy to convert your Portable StyleWriter to a full-featured desktop printer.

Everything you need to get started, including a battery, a power adapter/charger, ink cartridge, fonts, drivers, and printer cables come in the box.

FEATURES

Size

• Fits easily on a desktop or in a briefcase
• Weighs just 4.5 pounds

Print quality

- 360 dots-per-inch (dpi) resolution in best mode
- 180 dpi in fast mode
- 39 scalable fonts for printing a wide range of styles and sizes

Fonts

- TrueType fonts included are: ITC Avant Garde Gothic, ITC Bookman, Chicago, Courier, Geneva, Helvetica, Helvetica Narrow, Monaco, New Century Schoolbook, New York, Palatino, Symbol, Times, ITC Zapf Chancery, ITC Zapf Dingbats
- Adobe PostScript fonts when used with Adobe Type Manager software

Print speed

- Up to 1.5 pages per minute (varies with image complexity)

Interface

- One RS-422 serial port (converted to parallel with the supplied cable)

Versatility

- Allows printing on envelopes, labels, transparencies, letterhead or plain paper
- Operates horizontally or vertically, allowing it to be used in confined spaces
- Optional automatic sheet feeder available

Convenience

- Connects easily with any PowerBook, PowerBook Duo, or Macintosh computer
- Six front-panel buttons control basic operations
- Battery and power adapter/charger, ink cartridge, fonts, drivers, and cables included for fast, easy setup

System requirements

- System software version 7.0.1 or later
- Recommended: 4 MB of RAM or more with System software version 7

Paper handling

- Manual paper feeder accommodates all media
- Optional automatic sheet feeder holds up to 50 sheets

Battery

- Nickel-cadmium, rechargeable
- Approximately 60 pages per charge, 10 hour charging time (printer

can not be used during charging)

Ordering Information

Apple Portable StyleWriter
Order No. M1734LL/A
- Apple Portable StyleWriter printer
- Apple Portable StyleWriter ink cartridge
- Printer cable
- Portable StyleWriter accessory kit

Portable StyleWriter: Questions and Answers (3/95)

Revised: 3/22/95
Security: Everyone

Portable StyleWriter: Questions and Answers (3/95)

==========

Article Created: 28 June 1993
Article Reviewed/Updated: 22 March 1995

TOPIC ----------

This article addresses some commonly asked questions on the Portable StyleWriter.

DISCUSSION ----------

Question: Can I use the power adapter that came with my PowerBook with my Portable StyleWriter?

Answer: No. The power adapters for PowerBooks and Duo Docks are not compatible with the Portable StyleWriter power adapter. While the hardware plugs are the same, please heed the warning on the Portable StyleWriter power adapter and do not mix power adapters, using the wrong power adapter can damage the power adapter, the PowerBook and/or your Portable StyleWriter.

Question: What ink-cartridge does The Portable StyleWriter use?

Answer: The Portable StyleWriter uses the same ink-jet cartridge as the Apple StyleWriter and Apple StyleWriter II (Apple part number M8041G/B).

Question: Can The Portable StyleWriter use ink-cartridges and batteries designed for the Canon BJ-10ex (or BJ-10sx)?

Answer: Yes.

Question: Is The Portable StyleWriter compatible with Windows?

Answer: No. Apple has designed The Portable StyleWriter for use with Macintosh computers.

Question: Why does The Portable StyleWriter have a parallel port and not the Apple-standard serial port?

Answer: As we designed The Portable StyleWriter, our goal was to provide "Plug and Play" simplicity for our customers. We feel that The Portable StyleWriter's interface ports and cables meet our goal of ease of use.

Question: Which printer is recommended, the StyleWriter II or The Portable StyleWriter?

Answer: It depends on how a person will be using the printer. If the printer will remain on your desk, the StyleWriter is a superior solution (less expensive, faster, and with GrayShare). If your need is for a compact, transportable printer that operates with battery power, the Portable StyleWriter will meet your needs.

Question: Will Apple roll GrayShare into the Portable StyleWriter in the future?

Answer: Future revisions of the Portable StyleWriter are being evaluated, and GrayShare is certainly being considered.

Question: What is the cost per page of the Portable StyleWriter?

Answer: The cost of ink and paper should average out to about $0.05 per page.

Question: How fast is the Portable StyleWriter?

Answer: The Portable StyleWriter prints about one page per minute on 68030 equipped Macintosh PowerBooks.

Article Change History:
22 Mar 1995 - Reformatted and added new ink cartridge part number.
27 Apr 1994 - Corrected StyleWriter ink cartridge part number.

Portable StyleWriter: Specifications (6/93)

==========

Article Created: 28 June 1993
Article Reviewed/Updated: 25 October 1993

TOPIC ----------

This article gives the technical specifications for the Portable StyleWriter.

DISCUSSION ----------

Print engine

• Canon Thermal Ink Jet

Print quality

• 360 dots-per-inch (dpi) in best mode
• 180 dot-per-inch in fast mode

Print speed

• Up to 1.5 pages per minute (varies with image complexity)

Interface

• RS-422 serial port (converted to parallel with the supplied cable)

System requirements

• System software version 7.0.1 or later
• Recommended: 4 MB of RAM or more with System software version 7

Print materials

- #10 business envelopes
- Most standard labels
- Paper: U.S. Letter, U.S. Legal, A4, and B5
- Most letterhead and colored stock
- Medium-weight photocopier transparencies
- Apple recommends 3M brand CG3480 transparency film

Paper handling

- Manual paper feeder accommodates all media
- Optional automatic sheet feeder (50 page)

Sheetfeeder

- Size: 12.2" x 8.6" x 2.3" (310.0 mm x 217.5 mm x 57.5 mm)
- Weight: 2.9 lb (1.3 kg)
- Bin capacity : 50 sheets @ 17 lbs.
- Paper sizes: Letter, Legal, A4, B5 envelopes

Battery

- Nickel-cadmium, rechargeable
- Approximately 60 pages per charge, 10 hour charging time (printer can not be used during charging)

Power requirements

- U.S./Japan: 100 to 115 V, 50 to 60 Hz
- Europe/Australia: 220 to 240 V, 50 Hz

Power consumption

- 23 W maximum at 120 V or 220 V

Environmental requirements

- Operating temperature: 50° F to 95° F (10° C to 35° C)
- Relative humidity: 20% to 80% noncondensing

Size and weight

- Height: 1.9 in. (4.85 cm)
- Width: 12.2 in. (31.0 cm)
- Depth: 8.7 in. (22.1 cm)
- Weight: 4.5 lbs (2.04 kg)

Article Change History:
25 October 1993- Added more Sheetfeeder information
12 October 1993 - Added Sheetfeeder specifications

Portable StyleWriter: Printing Tips (5/96)

Revised: 5/9/96
Security: Everyone

Portable StyleWriter: Printing Tips (5/96)

==========

Article Created: 28 June 1993
Article Reviewed/Updated: 9 May 1996

TOPIC ----------

This article discusses how to obtain the best printing results with a Portable StyleWriter.

DISCUSSION ----------

Printing Tips

- Print Quality
  For faster printing and good print quality (180 dpi) select "Faster" in the Print Dialog box. For the best print quality, (360 dpi) but longer printing times, set this selection to "Best."

- Background Printing
  If you have more that 2 megabytes of RAM in your computer, it's a good idea to use background printing. This allows you to continue working on your Macintosh while the Portable StyleWriter is printing. (To turn on Background Printing, choose the Chooser from the Apple menu. In the Chooser window, click the Portable StyleWriter icon, then click the "On" button next to Background Printing.)
  If you do not have at least 2 megabytes of RAM installed in your computer, you should leave the "Background Printing" selection in the Chooser set to "Off."

- PowerBook 100
  If you use the Portable StyleWriter with a PowerBook 100, you must connect it to the Printer port; the Modem port is internal on the PowerBook 100. Be sure to select the Printer serial port in the Chooser after you install the printer driver.

- PowerBook Duo

If you are using a PowerBook Duo computer which is NOT docked while printing to the Portable StyleWriter, the modem port must be selected and AppleTalk must be set to "inactive" in the Chooser. If you have an internal modem installed, you should also verify that the Portable Control Panel (accessible from the Apple menu) has the port set to "external."

NOTE:
Later versions of the software show this option in the PowerBook Control Panel or in the PowerBook Setup control panel. This choice is installed by the Express Modem or Global village modem software. It probably will not be available when using an external modem.

- General
  Close the Chooser after making any printer set-up changes

ARA and Remote Only In Network Control Panel (6/93)

Revised: 6/25/93
Security: Everyone

ARA and Remote Only In Network Control Panel (6/93)

==========

Article Created: 25 June 1993

TOPIC ----------

Within AppleTalk Remote Access, the Remote Only option within the Network Control Panel causes a lot of confusion. The discussion below will hopefully serve to clear up some of that confusion.

DISCUSSION ----------

The Remote Only option directs AppleTalk traffic ONLY to the serial port in use by ARA. The other network options allow AppleTalk traffic to go to both the ARA serial port and the network connection defined in the Network Control Panel.

The Remote Only option is needed in two situations. The first, and most likely, is the case where an individual has an ImageWriter, or other local serial device, connected to the Printer serial port and has no networking card installed. When using ARA the Remote Only option must be selected since the default networking option is LocalTalk Built-In. If AppleTalk is made active and the Remote Only option is not selected, the serial device plugged into the Printer port will receive the AppleTalk data packets. The only possible way to use that serial device when using ARA is to use the Remote Only option. If another network option is selected, such as Token Ring, then the AppleTalk traffic is directed to the Token Ring card and the ARA serial port, not the Printer port.

The second situation occurs when a network service on the remote network has the same network identity as a service on the local network. In this case the remote service is not seen, only the local one. In order to see the remote service the Remote Only option must be selected. This will hide all the local network services and allow the ARA client to see everything on the remote network.

Note: It is not possible to change a network connection while using ARA. The ARA session must be disconnected, the network connection changed, and the ARA session re-established.

Portable StyleWriter and StyleWriter II: Differences (6/93)

Revised: 6/25/93
Security: Everyone

Portable StyleWriter and StyleWriter II: Differences (6/93)

==========

Article Created: 28 June 1993

TOPIC ----------

What are the differences between a Portable StyleWriter, and a StyleWriter II?

DISCUSSION ----------

Here are the primary differences between the Portable StyleWriter, and the StyleWriter II printer.

	Portable StyleWriter	StyleWriter II
Memory	N/A	128K
Speed:		
• Best Mode	3/4 page per minute	Up to 1 page/minute
• Faster/Draft Mode	1.5 pages/minute	Up to 2 pages/minute
Print Quality:		
• Best Mode	360 dpi (dots per inch)	360 dpi
• Faster/Draft Mode	180 dpi (dots per inch)	80 dpi
Grayscale Printing	N/A	Over 130 grayscales with GrayShare software
Paper Capacity	Manual paper feed	100 sheet multipurpose tray, 15 envelopes
Printer Sharing	N/A	Yes, with GrayShare software

Construction	Optional 50 sheet feeder	Sheet feeder and print mechanism in one unit
Interface	RS-422 serial port converted to parallel with the supplied cable	High-speed serial RS-422
Weight	4.5 pounds	6.6 pounds
Portable	Yes, fits in briefcase	Fits on desktop
Battery	Nickel-cadmium rechargeable	N/A

PowerBook Duo Express Modem: Battery Conservation Setting 6/93

Revised: 7/7/94
Security: Everyone

PowerBook Duo Express Modem: Battery Conservation Setting 6/93

==========

Article Created: 29 June 1993

TOPIC ----------

I am using an Express Modem in my PowerBook Duo. Does the Battery Conservation slider in the PowerBook control panel need to be at Maximum Performance in order to use the Express Modem successfully?

I would like to run with the Battery Conservation slider set to Maximum Conservation, since I am constantly running off of the battery. I have Express Modem software version 1.0.4. When I try to send a fax document, only about half the page gets faxed. When I try to call using Appletalk Remote Access, the modem will not even connect.

DISCUSSION ----------

When your PowerBook Duo is transmitting or receiving data or faxes, make sure that it does not go to sleep. You might want to select "Don't sleep when plugged in" from the Options dialog box in the PowerBook control panel.

When the Express Modem is in use (offhook, online, or when sending or receiving a fax), the PowerBook Duo should not use processor cycling or go into automatic sleep, regardless of the Battery Conservation options set in the PowerBook control panel. The Express Modem should work fine regardless of whether you select Maximum Performance or Maximum Conservation.

When sending or receiving a fax, using AppleTalk Remote Access, or a communications program, you should not close the Duo lid or select "Sleep" from the Finder, thus forcing sleep, as the call will be lost. Unfortunately, some third-party utilities for PowerBook power management may access the Power Manager on their own and may force sleep automatically, without regard to Express Modem activity. Try using the Express Modem with these utilities disabled if you suspect they may be causing the problem.

SNA•ps 3270 and Adjustable Keyboard (5/93)

Revised: 6/28/93
Security: Everyone

SNA•ps 3270 and Adjustable Keyboard (5/93)

==========

Article Created: 3 May 1993

TOPIC ----------

I'm trying to use an Apple Adjustable Keyboard with SNA•ps 3270 1.1.1. I get a dialog which more or less says "SNA•ps doesn't recognize your keyboard, so we'll use the regular Apple Keyboard layout". The SNA•ps 3270 1.1.1 release notes I got from AppleLink lists "Resources were added for new Norsi keyboard". However, the Read Me file on the 1.1.1 Install disk omits this entry.

I really don't want to have to use another keyboard, so is there any hope of resolution of this problem in some kind of timely manner?

DISCUSSION ----------

We tested this on my Quadra 950 and we got the same message the you received. SNA•ps 3270 1.1.1 and 1.1.2 worked fine with the Adjustable keyboard, that is, the standard keyboard only displays the basic keys not the function keys or the page up, down, and so on. You can enter data via the main keyboard without trouble. The function keys (located on a separate portion of the overall "keyboard community") did function as the default IBM function keys. The only thing that we noticed is the SNA•ps 3270 keyboard remapping features for the function keys, and others is not possible with the Adjustable keyboard.

The Internal Release notes which the you received stated that the support was added for the Norsi or the Adjustable keyboard. The fixes were at the time of the SNA•ps 1.1.1 engineering release (October 30,1992), was to be sure SNA•ps 3270 did not bomb when the Adjustable keyboard was used by the SNA•ps 3270 client Macintosh. The Adjustable keyboard was not final when SNA•ps 3270 1.1.1 was final. The SNA•ps 3270 1.1.1 product still has an outstanding reported bug for full support of the Adjustable Keyboard. The full support for this keyboard includes supporting several ADB (Apple

Desktop Bus) devices which collectively make up a keyboard. The main keyboard reports an ADB address, the function keyboard reports another ADB address and the sound controls appear to report a third. The standard keyboard remapping logic in just about any emulation product (DEC, HP, IBM, etc.) has had some problems with the Adjustable keyboard.

So in summary, SNA•ps 3270 1.1.1 and 1.1.2 behaves pleasantly with the Adjustable keyboard. SNA•ps 3270 1.1.1 and 1.1.2 will function with the Adjustable keyboard and the function keys will be defined as the mapping default makes them.

Performa and Macintosh: CD Set Limits and Workarounds (6/93)

Revised: 7/2/93
Security: Everyone

Performa and Macintosh: CD Set Limits and Workarounds (6/93)

==========

Article Created: 24 June 1993

TOPIC ----------

Some of the CDs I received in the wallet pack with my Performa don't work. What can I do to get them to work?

DISCUSSION ----------

There are two explanations for various CDs not functioning as expected:

- 32-Bit Compatibility
  Turn off 32-bit addressing (in the Memory control panel) to eliminate this possibility.

- HyperCard May Need More RAM
  At least one of the CDs includes HyperCard 2.1, with RAM settings of 750K minimum and 3500K preferred. Increase the RAM allocated to HyperCard (using the Get Info dialog box from the Finder) to work around this.

There are two sets of CDs available -- an 8-pack and a 10-pack -- based on different reseller bundles. This article refers only to the 8-pack; however, the same concepts should apply to the 10-pack.

Below is a list of the CDs with reported problems and workarounds (please note that the solutions and workaround apply only to the sections mentioned here; other parts of the CDs weren't tested):

- Chronicles: opening Chronicle QT stack in 32-bit mode will freeze the screen. This appears to work fine in 24-bit mode.

- Compton's: Appears to run fine in 32-bit mode, but the Installer for loading software onto the start-up volume won't run.

- Macintosh Demo Games: This uses an altered version of At Ease. The demo for Anatomist won't run in 32-bit mode; it's okay in 24-bit mode. The demo from Annabel's Dreams of Ancient Egypt also won't run in 32-bit mode, but is fine in 24-bit mode.

- Mozart: Some problems getting sound to function normally. Try using the version of HyperCard (with audio) from the CD. The watch cursor stays on screen for a long time until clicked (it doesn't return to a normal cursor in HyperCard). This CD does work in 32-bit mode.

- Discis: No problems with Cinderella.

- Kodak Photo CD - Photo Sampler: This requires Foreign File Access in the System Folder; otherwise, it asks to initialize the disc. It works fine in 32-bit mode.

- Alice to Ocean: No problems reported.

- Apple CD-ROM Titles Sampler: Problems starting the demo "SVINGA" -- if you click, it flips back to the Home stack. Use "option –>" to start. HyperCard 2.1 on this CD is set to 750K minimum and 3500K preferred. If you have your own version of HyperCard on the hard drive and it's set to use less RAM, many HyperCard-related problems could result.

Performa Monitor: Usable Screen Less Than 14 Inches (1/94)

Revised: 1/28/94
Security: Everyone

Performa Monitor: Usable Screen Less Than 14 Inches (1/94)

==========

Article Created: 25 June 1993
Article Reviewed/Updated: 24 January 1994

TOPIC ----------

I have a Performa 450 with a 14-inch monitor. However, the actual screen space used is much less than the size of the monitor. Is there anything I can do to reduce the black border around the screen and get a bigger image?

DISCUSSION ----------

It's normal for your Performa Plus Display to have a black border around the displayed picture. If you look at any Apple Macintosh monitor you'll see this. The closer an image gets to the edges of a display, the lower its quality. The black border will vary in size, however the image size should be 9.5" x 7" (240 mm x 180mm +/-3mm.)

Depending on the model number of your Performa display, you can adjust the screen picture. Please refer to the table to determine your Monitor model number and whether that monitor has adjustment knobs

Monitor	Model Number	Adjustment Knobs
Performa Plus Display	M9102LL/D	NO
Performa Plus Display	M9102LL/B	YES
Performa Display	M9101LL/D	NO
Performa Display	M9102LL/A	YES

Adjusting the Picture Size Using Adjustment Knobs

On the front of your Performa Plus Display are two adjustment knobs to change the vertical and horizontal position of the picture. On the back of the monitor, there are two knobs that allow you to distort and stretch the picture to reduce the black border. The knobs don't give you more screen

area to work with; they just stretch out what is already on the screen. They might not allow you to remove the border completely.

LW IIf and IIg: Printing from a DOS computer (11/95)

Revised: 11/2/95
Security: Everyone

LW IIf and IIg: Printing from a DOS computer (11/95)

==========

Article Created: 25 June 1993
Article Reviewed/Updated: 2 November 1995

TOPIC ----------

Can you explain how to print from a DOS computer to a LaserWriter IIf or IIg?

DISCUSSION ----------

Follow these steps:

1) Create the following mode statements to the auto exec.bat:

```
mode com1:9600,n,8,1

mode lpt1:=com1:
```

These will redirect the print command to com1.

2) Verify that the thumbwheel (printer select switch) is set to either 0 or 5, this assumes you are going to print PostScript to the LaserWriter IIf. If you are going to print HP emulation, then set the thumbwheel to 1.

3) Verify the proper cable is being used. Here are the pinouts for two different cables:

Begin_Table

IBM RS-232 Serial (DB-25 Female Connector)			LaserWriter (DB-25 Male Connector)	
(SG)	1	----------	1	(SG)
(TXD)	2	----------	3	(RXD)
(RXD)	3	----------	2	(TXD)
(RTS)	4	----------	5	(CTS)
(CTS)	5	----------	4	(RTS)

```
      (DSR)  6      ---------------------------------    8&20(DCD/DTR)
      (GND)  7      ---------------------------------    7   (GND)
      (DCD/DTR)8&20 ---------------------------------    6   (DSR)

       IBM RS-232 Serial              LaserWriter
   (DB-9 Female Connector)      (DB-25 Male Connector)

          (CD)  1   --------------   4  (RTS)
          (RXD) 2   --------------   2  (TXD)
          (TXD) 3   --------------   3  (RXD)
          (DTR) 4   --------------   5&6(CTS/DSR)
          (SG)  5   --------------   7  (SG)
    (DSR/CTS)6&8    --------------   20 (DTR)
          (RTS) 7   --------------   8  (DCD)
          (RI)  9   --------------   not connected
```

End_Table

At this point, the printer is properly configured, has the proper cable, and the PC has the appropriate mode statements to direct printing to the serial port.

Try printing a directory by copying the contents of the directory to lpt1. You can't do a printscreen because "lpt1" is not a PostScript command and the printer will not understand it.

Article Change History:
02 Nov 1995 - Updated pinout table, reformatted for the World Wide Web.

MacX Does Not Support LAT (4/93)

==========

Article Created: 7 April 1993

TOPIC ----------

Does MacX support the LAT tool? I was told by someone that it did, but I couldn't get it to work. If so, what are the tested configurations?

DISCUSSION ----------

Currently there is no support for LAT in MacX. The only support included is for the AppleTalk/DECNet Tool, DECNet Tool, and MacTCP Tool.

At this time there are no plans to add support for LAT in MacX.

PowerBook, One Serial Port, Express Modem, and ARA (5/96)

Revised: 5/8/96
Security: Everyone

PowerBook, One Serial Port, Express Modem, and ARA (5/96)

==========

Article Created: 12 March 1993
Article Reviewed/Updated: 8 May 1996

TOPIC ----------

Users cannot get Apple Remote Access (ARA) to dial out on PowerBook (Duo) 200 and 2300 series when they are _not_ in a dock. They might encounter similar problems with PowerBook 500 series computers which cannot be put in a dock.

DISCUSSION ----------

Macintosh PowerBook computers with only one serial port, except the PowerBook 100 and 150*, require some additional steps when using ARA and/or AppleTalk. Confusion stems from the fact that some PowerBook computers (for example the PowerBook 200, 2300, and 500 series) a single, 'split' serial port. This port is mapped as a modem port, but also handles AppleTalk like a printer port would.

This one serial port is mapped on the logic board as a modem port (that is the default). Most software developers who write software that addresses and uses the Macintosh serial port assume there are two serial ports in all Macintosh computers, not just one.

To successfully use a PowerBook computer that has a split serial port with an internal modem and ARA you need to make sure the following conditions are met:

1) When using an internal modem such as the Apple Express Modem, Express Modem II, or Global Village PowerPort Mercury modem with ARA:

• AppleTalk must be enabled in the Chooser. This may require restarting the computer.

• The Network control panel must be set to LocalTalk, NOT to the ARA icon for "Remote Only."

• The PowerBook Setup control panel changes appearance when the Express Modem is installed, and gives an option for "Internal Modem." Make sure this is

selected.

On System 7.1.1 and higher and Duo 250 and higher this second option applies.

• The PowerBook Setup control panel changes appearance when the Express Modem is installed, and gives an option for "Normal." Make sure this is selected.

Note, if the Global Village PowerPort 2.5.2 or later software is installed, the option "Normal" can be found in the PowerPort control panel by selecting the Configure Port button.

• In the Express Modem control panel, the modem must be set to "on."

• When the ARA software is opened and the computer is docked, it indicates options for communication through the modem port, the printer port, or the internal modem. When the machine is not docked, the options become two: printer/modem and internal. Make sure it is set to "internal."

2) When using an EXTERNAL modem for ARA through the computer's single serial port:

• AppleTalk must be enabled in the Chooser.

• The Network control panel must be set to "Remote Only," NOT "LocalTalk."

• If an Express Modem is installed, make sure the Express Modem control panel is set to "off."

• When the ARA software is opened, make sure it is set to use the combination printer/modem serial port and not the internal modem.

* Note: This does not apply to the PowerBook 100 and 150 because the single serial port is not a 'split' serial port. It is mapped only as a printer port. Therefore, an internal modem would not affect its functionality.

Article Change History:
08 May 1996 - Corrected control panel reference.
21 Feb 1996 - Clarified difference with 100 and 150 serial port.
20 Feb 1996 - Removed PowerBook 150, it is not like the Duos.

AppleShare 3.0.x: Set Up For Large Group Possibilities (6/93)

Revised: 6/29/93
Security: Everyone

AppleShare 3.0.x: Set Up For Large Group Possibilities (6/93)

==========

Article Created: 29 June 1993

TOPIC ----------

I'm going to install a network and use AppleShare 3.0.2 for file sharing. I need advice on how to create users and groups with proper security for about 40 lawyers and 10 secretaries. When a case is created, two random lawyers are assigned to it with both needing access to the case folder, as do their secretaries. No one else should have access to these files unless they are public. Each lawyer may be teamed up with another lawyer on as many as 50 ongoing cases at a time. This wouldn't be the same pairing of lawyers every time, there is a possible 39 combinations for one lawyer. There are no set groups in this scenario. They handle roughly 700 cases a year with one user belonging to 42 groups.

What is the best way to set up users & groups to accommodate this scenario?

DISCUSSION ----------

If we understand the scenario you describe correctly we recommend the following:

First of all it is essential to remember that a User and a Group are virtually interchangeable in AppleShare 3.x. This fact will give you the flexibility needed to implement a viable solution for your client.

Create a group for each lawyer and secretary pair. Even if each lawyer worked with all 10 secretaries this would still only add up to 400 groups. For each case folder assign one lawyer/secretary pair to the Owner field and the other lawyer/secretary pair to the User/Group field. Give both Owner and User/Group all privileges and set Everyone to no privileges.

At this point you have a maximum of 400 groups, only 40 if each lawyer always uses the same secretary. The case folders can now be assigned to

any combination of lawyer/secretary pairs without worrying about number of users or groups. If a special case requires more than two lawyers then a special group containing the appropriate people could be created. If you start running out of groups in that scenario then delete old groups and assign those case folders to the administrator for archiving.

System 7.x: Personal File Sharing That Will Not Start (3/95)

Revised: 3/20/95
Security: Everyone

System 7.x: Personal File Sharing That Will Not Start (3/95)

==========

Article Created: 5 May 1993
Article Reviewed/Updated: 20 March 1995

TOPIC ----------

After turning on file sharing with the Sharing Setup control panel, the Status window says, file sharing is starting up, but never changes to, file sharing is on. User can not restart or shutdown because file sharing will not complete it startup sequence.

DISCUSSION ----------

File sharing will not startup because the invisible AppleShare PDS file is corrupt on one or more of the volumes attached to the Macintosh. Follow the steps below to erase the AppleShare PDS file so file sharing can complete the startup sequence:

Step 1
Turn file sharing off using the Sharing Setup control panel.

Step 2
Delete the Users & Groups data file in the Preferences folder.

Step 3
Restart the computer.

Step 4
Open the Sharing Setup control panel, and enter a new Owner Name, Owner Password, and Macintosh Name replacing any previous data. Be sure to use new or different names.

Step 5
Turn File Sharing on.

NOTE: If the first 5 steps above resolve your problem do not proceed any further.

Step 6
Delete the invisible AppleShare PDS file at the root of any volumes that are mounted when sharing. You can delete the PDS file with ResEdit or a third-party utility that can view invisible files. Using the utility, click and deselect the Invisible checkbox of the file to make it visible on the desktop, and then drag the AppleShare PDS file to the trash from the Finder. You need one of these utilities to delete the file.

IMPORTANT: Deleting the AppleShare PDS file removes all access privileges assigned to folders. You will need to reassign access privileges to the folders.

Step 7
Restart the computer.

Step 8
Turn file sharing on. New AppleShare PDS files will be created and file sharing status should change from "starting up" to "on" after a short period of time.

ARA: Setting the bps Rate On A Telebit QBlazer (3/93)

Revised: 6/29/93
Security: Everyone

ARA: Setting the bps Rate On A Telebit QBlazer (3/93)

==========

Article Created: 3 March 1993

TOPIC ----------

When trying to connect to AppleTalk Remote Access (ARA) with my Telebit QBlazer, it tells me the modems cannot connect. I try to confirm that it is working by using an application like Microphone II, but all I get is garbage when trying to enter the commands. What do I do?

DISCUSSION ----------

When using different telecommunications products, the QBlazer's S51 register can be set to a different bps rate. Unfortunately just turning the modem off will not reset the modem.

To set the S51 register to a different bps rate, open a communication program such as Microphone II or SmartCom and follow the directions below:

1) If receiving garbage when typing to the application, try the different modem speeds allowed. In Microphone II, this would be in the Settings menu.

2) Once the garbage disappears and the application and modem are talking to one another, type in ats51=n

where n = the desired number listed below:

0 = 300 bps
1 = 1200 bps
2 = 2400 bps
3 = 4800 bps
4 = 9600 bps
5 = 19200 bps
6 = 38400 bps

252 = Automatic speed selection

3) Type atdt to obtain a dial tone. This will confirm the modem and application are talking at the same level.

Apple Workgroup Server 95: How To Rebuild Desktop (6/96)

Revised: 6/10/96
Security: Everyone

Apple Workgroup Server 95: How To Rebuild Desktop (6/96)

==========

Article Created: 7 June 1993
Article Reviewed/Updated: 10 June 1996

TOPIC ----------

How do you rebuild the Finder desktop under A/UX 3.01 on the Apple Workgroup Server (AWS) 95?

DISCUSSION ----------

Ideally, the desktop could be rebuilt by holding down CMD-OPTION keys. The problem with this approach is the timing has to be very precise for it to work. To do this, hold this keys down immediately after the empty menu bar is drawn on the screen when you are starting a session. Another way to make sure the timing is correct would be to logout and wait for the empty menu bar to appear and then hold the keys down until the dialog asking "Are you sure you want to rebuild..." appears. The rebuild process could take a long time, depending on the size of the root volume and how many file systems are mounted.

If you are having problems with the above approach, and if you are using the AWS 95, and have autologin to root, and root is using the default system folder, follow this procedure.

1) Restart the system
2) When the "cancel" button appears after the A/UX launch, click it.
3) You will end up at a "startup#" prompt.
4) Type the following:

```
cd "/mac/sys/System Folder"
mv "Desktop DB" "Desktop DB.old"
mv "Desktop DF" "Desktop DF.old"
mv "%Desktop DB" "%Desktop DB.old"
mv "%Desktop DF" "%Desktop DF.old"
launch
```

You will then see A/UX startup. Again rebuilding the desktop may take some time, depending on the amount of local disk space attached.

If the problem is resolved, you can go back and remove the old/renamed files.

1) Restart the system
2) When the "cancel" button appears after the A/UX launch, click it.
3) You will end up at a "startup#" prompt.
4) Type the following:

```
cd "/mac/sys/System Folder"
rm "Desktop DB.old"
rm "Desktop DF.old"
rm "%Desktop DB.old"
rm "%Desktop DF.old"
launch
```

Article Change History:

Apple Workgroup Server 95: How To Add Volumes (6/93)

==========

Article Created: 7 June 1993

TOPIC ----------

How do you add AppleShare volumes to the Apple Workgroup Server (AWS) 95?

DISCUSSION ----------

To add AppleShare volumes to the AWS 95, you need to do the following:

1) Install AppleShare Pro on the AWS 95.

2) Physically install the new disk drive. Remember that for best performance, drives should be attached to a SCSI chain on the PDS card.

3) After restarting A/UX, start up the Apple HD SC Setup program located in the Applications folder on the "/" drive.

4) Select both the SCSI bus number and the SCSI id of the new drive, then click the Initialize button.

5) When done initializing the disk, click on Partition. Select "File Server Data" for the partitioning scheme. Enter the number of equal partitions you want on the disk (from 1 to 12). This will create UNIX file systems, rather than HFS file systems, which are recommended for better performance.

6) Create a mount point for each partition. This is a unique name for each partition. By default, the mount points are located under "/ Shared Data".

7) After creating a mount point for each partition, click Quit to return to the Finder.

AppleShare 4.0 and Pro: 3.0 Client Compatibility (6/93)

Revised: 6/29/93
Security: Everyone

AppleShare 4.0 and Pro: 3.0 Client Compatibility (6/93)

==========

Article Created: 7 June 1993

TOPIC ----------

Will AppleShare 3.0 and System 7 clients be able to use AppleShare 4.0 and AppleShare Pro servers without new workstation software?

DISCUSSION ----------

Yes, however, users will not be able to receive the full range of server messages nor be able to use the extended password security features of AppleShare Pro, unless they specifically upgrade their AppleShare workstation software.

Apple Workgroup Server 95: How Mount Points Work (6/93)

Revised: 6/29/93
Security: Everyone

Apple Workgroup Server 95: How Mount Points Work (6/93)

==========

Article Created: 7 June 1993

TOPIC ----------

How do "mount points" work on the Apple Workgroup Server (AWS) 95?

DISCUSSION ----------

UNIX file systems are hierarchical with only one root, the startup volume. If there is more than one physical disk (or partition) all volumes must be connected to that startup volume. These connections are made with "mount points". The administrator chooses a folder on the startup volume for each additional volume to connect to (by default, this is "/ Shared Data"). The additional volume then appears as a folder within the chosen folder (this is the "mount point").

Since AppleShare Pro runs atop the A/UX file system, there is one special consideration when sharing. Folders with mount points in them can not be shared. This includes the A/UX startup volume (which has the Macintosh startup volume mount point in it).

If all mount points are created within the " Shared Data" folder, then you would normally share each folder within the " Shared Data" folder within AppleShare Administrator.

AWS 95: Sharing Other UNIX Data Over AppleShare Pro (4/95)

==========

Article Created: 7 June 1993
Article Reviewed/Updated: 19 April 1995

TOPIC -----

Can an Apple Workgroup Server (AWS) 95 be used to share data on other UNIX systems with Mac OS systems?

DISCUSSION -----

Yes, the AWS 95 can NFS mount the data from the other UNIX systems, and then the NFS mount points can be shared with AppleShare Pro. However, this is not a recommended configuration. The server software was optimized for performance using AppleShare services only.

AWS 95: Comparability of Users & Groups Files of OS (6/93)

==========

Article Created: 7 June 1993

TOPIC ----------

Is there any connection between A/UX users and groups and AppleShare Pro users and groups files?

DISCUSSION ----------

No. This information is contained in separate data files. AppleShare Pro only knows about users and groups defined within the Users and Groups Data file, located in the Preferences folder in the System Folder (which will normally be located in /mac/sys/System Folder). For UNIX-style logins in A/UX (telnet, ftp, and so on) only knows about users defined in the /etc/passwd file.

AppleShare 3.0, 4.0, and Pro: Technical Differences (4/95)

Revised: 4/18/95
Security: Everyone

AppleShare 3.0, 4.0, and Pro: Technical Differences (4/95)

==========

Article Created: 7 June 1993
Article Reviewed/Updated: 18 April 1995

TOPIC ----------

What are the technical differences between AppleShare 3.0, 4.0, and Pro?

DISCUSSION ----------

AppleShare 4.0 and Pro new features from AppleShare 3.0

• Read Ahead. When a client makes a request of the server that requires reading, the server will read more than the client requested, or "read ahead". The server makes an assumption of what the next logical section of disk should be and reads it into RAM. In general, the client will ask for that section in its next network request and receive an immediate response because the data is already in RAM.

• Write Behind. After the server receives data from the network and stores it to RAM, it informs the client of write completion even though the actual write to disk has not been done at the time the server sent the notification. In theory, writes are lagging behind the messages. Because of the difference in speed between networks and high speed SCSI devices, by the time the user gets the message the write may have actually completed.

• File, directory, and icon caching. AppleShare 4.0 and Pro allow for the use of main memory as a level 3 cache.

• Number of Users. AppleShare 4.0 and Pro support an increased number of users.

• Apple II network booting is not supported.

AppleShare 4.0 and AppleShare Pro differ in the following

• Operating System: AppleShare 4.0 runs under Mac OS, AppleShare Pro runs under

A/UX 3.01.

• Number of Users: AppleShare 4.0 supports a maximum of 150 simultaneous users; AppleShare Pro supports a maximum of 200 simultaneous users.

• Serialization: Each copy of AppleShare 4.0 will have its own unique serial number assigned at manufacturing time.

• Write behind: Since A/UX 3.01 has intelligent I/O, whenever multiple writes are pending the file system will spool several write requests, organize them in disk order, position the disk head, and then SCSI burst them all onto the disk in one pass. This makes AppleShare Pro the fastest server under heavy load and multiple write conditions.

Energy Star: LaserWriter Sleep Setting (6/93)

Revised: 6/30/93
Security: Everyone

Energy Star: LaserWriter Sleep Setting (6/93)

==========

Article Created: 30 June 1993

TOPIC ----------

I have two questions about the Energy Star software for the LaserWriter Pro.

1) Is the Energy Star sleep setting information saved in PRAM, or is it lost when the printer is turned off (as opposed to restarting it)?

2) After downloading the "30 minute sleep" file to my LaserWriter Pro 630, I viewed the log file to check that the sleep timer had been set to 1/2 hour. I restarted the printer but I didn't notice anything different. Should I?

DISCUSSION ----------

1) The "sleep" setting does in fact get saved in the LaserWriter Pro's NVRAM (Non Volatile RAM), so it is maintained across power cycles. The information gets saved to NVRAM when the printer is restarted or shut down. One important thing to remember is that the new sleep setting doesn't take effect immediately. It takes effect after the printer has been power cycled.

2) You are correct. There seems to be no visual difference when the printer goes to “sleep.” Checking the log file (as you have done) is the only way to verify that the sleep setting has taken effect. It appears that the majority of the energy savings are obtained through the fuser assembly by not having to maintain specific temperatures required during printing.

LW IIg and Pro 630: LocalTalk and EtherTalk Printer Names 6/93

Revised: 7/6/93
Security: Everyone

LW IIg and Pro 630: LocalTalk and EtherTalk Printer Names 6/93

==========

Article Created: 1 July 1993

TOPIC --

Is the LaserWriter IIg, capable of storing a separate printer name for LocalTalk and EtherTalk?

DISCUSSION --

The LaserWriter IIg, as well as the LaserWriter Pro 630 (which also has an EtherTalk port), has separate areas in NVRAM (non-volatile memory) to store a LocalTalk and an EtherTalk printer name. This functionality is provided since these printers can have all of their ports connected to simultaneously. Thus, one could assign a different name for the printer on a LocalTalk network, and on a EtherTalk network by using the LaserWriter Utility from Macintoshes on the respective networks.

AWS 95 - A/UX: Remove File with 8-Bit, Option Characters (5/95)

Revised: 5/11/95
Security: Everyone

AWS 95 - A/UX: Remove File with 8-Bit, Option Characters (5/95)

==========

Article Created: 30 June 1993
Article Reviewed/Updated: 11 May 1995

TOPIC ----------

I have special Macintosh characters in my file names on my Apple Workgroup Server (AWS) 95 Disk, such as "∑rich".

When I try to remove them from the command shell by the command:

rm ∑rich

OR

rm "∑rich"

I am prompted, "Use 'exit' to leave csh". How can I remove these files from the command shell or startup shell?

DISCUSSION ----------

You can create, copy, or rename file names with a special character -- such as the trademark character -- under the A/UX 3.x Finder. Under CommandShell running the default shell, csh, you cannot EXPLICITLY specify the file name with a special character on the command line since this special character cannot be recognized by the CommandShell. Hence, you get the "Use exit to leave csh" message.

Additionally, the option 8, "•" is usually translated into a period in the CommandShell environment, but with the environment variable TBSEEDOTS=1 set in A/UX 3.1.1, this character is translated to "," in the CommandShell environment. If the usual delete commands "rm" or "rmdir" are used to remove one of these files, the CommandShell may report that the file with these characters is nonexistent, even though you can see it both from the Finder and by using the "ls" command in the command shell.

Here is how to remove eight bit characters like Δ, ¥, •, œ, and ø in a file's name under AWS 95 A/UX CommandShell or A/UX Startup Shell.

Under A/UX CommandShell

Option 1

No matter which CommandShell you are using, you can do:

```
ls -li     # To list all files in a directory, and find the inode number
.          # that the 8-bit character file name you are going to delete.

find . -inum inode-number(s) -exec rm {} \;  # This will remove all files
.                                            # with the correspondent
.                                            # inode.
```

NOTE: The inode-numbers(s) are the inode numbers you found with 'ls -li', for example remove files with inode numbers 100, 120, 140, and 155. Below is an example of the command to remove files with inode numbers 100, 120, 140, and 155.

```
find . -inum 100 120 140 155 -exec rm {} \;
```

Option 2

Under Korn Shell (ksh), you can explicitly remove that file, for example, try to remove the ΩabcΔ file.

```
% ls -FC
--> ΩabcΔ
$ ksh
$ rm *abc*
```

or

```
$ rm ΩabcΔ
```

If the file name contains space(s), you may use single quotes to enclose the name. Below is an example:

```
$ rm 'Ω a b cΔ'
```

Under A/UX Startup Shell

Sometime it may necessary to go into the Startup Shell to remove or move files, if the system crashes as a result of a eight bit character file name in the System Folder, and these files need to be removed or moved to some other directory. To get into the Startup Shell, press Command-"." (period) to stop the A/UX start up process while A/UX Startup is launching; you will then get to the

"startup#" prompt. Since the 'find' command is not available in A/UX Startup Shell, use the 'rm -ir' command, and answer no to all the files in the directory except the offending file.

```
startup# cd to-a-directory
startup# rm -ir .
```

NOTE: There is a space and period following the r.

WARNING: This command does a recursive delete of the current directory asking for permission for every file. DO NOT FORGET THE "-i" OPTION because the -r option alone recursively deletes the entire contents of the specified directory, and the directory itself.

Macintosh: Non-English Characters (6/93)

Revised: 7/2/93
Security: Everyone

Macintosh: Non-English Characters (6/93)

==========

Article Created: 25 June 1993

TOPIC --

I am trying to add an accent to the word resume. I cannot find a key on the keyboard that will allow me to add the accent mark.

DISCUSSION --

To type a character with a diacritical mark (such as an acute accent or an umlaut), you press an Option key with a specific letter key, then you type the character. Example: type r,e,s,u,m,option-e,e. This will result in resumé appearing on the screen.

DIACRITICAL MARK	KEY COMBINATION
Grave accent (`)	Option-`, then type the character
Acute accent (´)	Option-e, then type the character
Circumflex (^)	Option-i, then type the character
Tilde (~)	Option-n, then type the character
Umlaut (¨)	Option-u, then type the character
The letter c with a cedilla (ç)	Option-c

If the character appears after the diacritical mark (rather than with it), then the marked character is not available in the font you are using.

SCSI Probe: Not Responding After Adding SCSI Drive (6/93)

Revised: 7/1/93
Security: Everyone

SCSI Probe: Not Responding After Adding SCSI Drive (6/93)

==========

Article Created: 1 July 1993

TOPIC ----------

When I try to run SCSI Probe, I briefly get the wristwatch and the desktop blinks but no SCSI device table comes up. This happened after I added another SCSI hard disk. Before that everything worked fine.

DISCUSSION ----------

You probably have conflicting SCSI device numbers. Check that every SCSI device has a unique number and that none of the external devices have number 0 or 7, which are reserved for the internal hard disk and the Macintosh itself, respectively. Typically, there is a rotary dial on SCSI devices for setting the device number.

Improve Performance of SNA•ps 5250 & DAL For AS/400 (7/93)

Revised: 7/7/93
Security: Everyone

Improve Performance of SNA•ps 5250 & DAL For AS/400 (7/93)

==========

Article Created: 2 July 1993

TOPIC

This article covers two items which can be done to the configuration of an AS/400 which will improve the performance of SNA•ps 5250 and DAL For The AS/400.

DISCUSSION

AS/400 Process Overview

To understand these configuration changes, it is helpful to review how these products are connected externally and internally with the AS/400. Both SNA•ps 5250 and DAL use APPC sessions which are Prebound-Contention Winners that are provided through a SNA•ps Gateway connection. The physical connection to the AS/400 is via a Token Ring or SDLC line attachment. Since this is an APPC connection and the SNA•ps gateway is in a Peer-to-Peer relationship, the Macintosh client applications make a call to a transaction program which is available on the AS/400. SNA•ps 5250 calls the Display-Station Passthru program while DAL for the AS/400 calls the DALSERVER.

The AS/400 is divided up into subsystems which receive and manage work for the system and users. The major subsystems are QBATCH, QINTER and QCMN. QBATCH manages all batch processing jobs running in the AS/400. The QINTER subsystem is used by all interactive jobs such as terminal emulation and print emulation. When SNA•ps 5250 is logged onto the AS/400, an interactive job is running in the QINTER subsystem. The QCMN subsystem is used by the APPC connections to the AS/400. These include DAL for the AS/400, SNA•ps 5250, and PC Support (for IBM PCs). Any client application which makes a program call via an APPC link, has to first be managed by QCMN and have a job assigned to the process.

When SNA•ps 5250 requests the Display Station Passthru request to the AS/400, QCMN deals with the request. Once the user logs on the AS/400, a second job is started in the QINTER subsystem which manages that part of the user process. So with SNA•ps 5250, there are two AS/400 jobs running, one in QCMN for APPC and one in QINTER for the interactive terminal process.

When DAL for the AS/400 requests a connection to the AS/400, a call to the DALSERVER is made and the QCMN subsystem manages the entire job. The DAL client user logs on to the DALSERVER using AS/400 security for validation but a DAL session is always an APPC session on the AS/400 and does not create a second interactive job to support the process like SNA•ps 5250.

So you can see the QCMN subsystem is very important to the operation and performance of both DAL and SNA•ps 5250. There are two entries in the QCMN subsystem which can be altered to better optimize performance: routing entries and prestart job entries.

Based on how QCMN is configured for routing entries, a Class gets assigned to the process. A class contains parameters that control the running of a routing step. The Class defines the overall Run Priority of the job in the AS/400. The rating for Run Priority ranges from 1 (very high availability of the AS/400 resources to the job) to 99 (very low availability of AS/400 resources to the job). The Class also defines the Time Slice of the AS/400 that is assigned to the job. Time Slice is defined as a maximum amount of processor time, in milliseconds, given to the job before other jobs are given the opportunity to run. The time slice establishes the amount of time needed by the job to accomplish a meaningful amount of processing. At the end of the time slice, the job might be put in an inactive condition so that other jobs can become active. The larger that Time Slice value, the more processor time can be assigned to the job before other jobs step in. The range of Time Slice is 1000 to 10,000 milliseconds.

The Prestart job entries allow the QCMN subsystem to be prepared to run a large program, such as, the DALSERVER. A Prestart job can have a Class with a higher Run Priority than the default values given the routing entries in the Subsystem.

Changing Routing Entries Details For SNA•ps 5250

QCMN Routing Entries

If a DSPSBSD AS/400 command is done for the QCMN subsystem, the following screen appears:

```
 Subsystem description:   QCMN           Library:   QSYS
 Status:   ACTIVE

 Select one of the following:
```

1. Operational attributes
2. Pool definitions
3. Autostart job entries
4. Work station name entries
5. Work station type entries
6. Job queue entries
7. Routing entries
8. Communications entries
9. Remote location name entries
10. Prestart job entries

• Select option 7, Routing Entries:

>>>>>>>>>>>>>>>>>>>>>>>>>

Opt	Seq Nbr	Program	Library	Compare Value	Start Pos
	50	*RTGDTA		'QVPPRINT'	37
	100	*RTGDTA		'QTFDWNLD'	37
	150	*RTGDTA		'QMFRCVR'	37
	180	*RTGDTA		'QPAPAS'	37
	200	*RTGDTA		'QMFSNDR'	37
	210	*RTGDTA		'QHQTRGT'	37
	220	*RTGDTA		'QRQSRV'	37
	230	*RTGDTA		'QPCSUPP'	37
	250	*RTGDTA		'QCNPCSUP'	37
	275	*RTGDTA		'#INTER'	1
	300	*RTGDTA		'PGMEVOKE'	29
	325	*RTGDTA		'QPCSUPP'	1
	350	*RTGDTA		'RSCLIB47'	1

>>>>>>>>>>>>>>>>>>>>>>>>>

The Sequence numbers are in order of system searches for a match in the program call to the subsystem. The program call is in the form of a call record which is character start position oriented. The word PGMEVOKE always appears starting in column position 29 followed by the actual name of the program in start position 37. The routing entries shown above have two entries which are found in OS/400 V2R2M0 and important to SNA•ps and DAL. Sequence number 300 is a generalized matching entry, supplied by IBM, for any PGMEVOKE with a name that does not match any of the specific names found starting in position 37. The routing entry with sequence number 180 was added to catch the Display Station Passthru call from SNA•ps 5250 to the QCMN subsystem. Before the addition of sequence 180, the call was routed based on the entry with sequence number 300. Lets look at the differences between these two entries.

Sequence number 300:

```
 Routing entry sequence number . . . . . :   300
 Program . . . . . . . . . . . . . . . . :   *RTGDTA
   Library . . . . . . . . . . . . . . . :
```

```
 Class . . . . . :   QBATCH
   Library . . . . . :     QGPL
 Maximum active routing steps  . . . . . :   *NOMAX
 Pool identifier . . . . . :   1
 Compare value . . . . . :   'PGMEVOKE'

 Compare start position  . . . . . :   29
```

The Class for this entry is QBATCH which is IBM supplied and has a Run Priority of 50. The Time Slice is 5000 milliseconds. This is lower than any PC Support process which runs with Priority 20.

Now lets look at the Sequence number 180 entry:

```
 Routing entry sequence number . . . . . :   180
 Program . . . . . :   *RTGDTA
   Library . . . . . :
 Class . . . . . :   QWCPCSUP
   Library . . . . . :     QGPL
 Maximum active routing steps  . . . . . :   *NOMAX
 Pool identifier . . . . . :   1
 Compare value . . . . . :   'QPAPAS'

 Compare start position  . . . . . :   37
```

The Class for this entry is QWCPCSUP which is IBM supplied and has a Run Priority of 20. This is the same as that of any PC Support process and places the SNA•ps 5250 workstation function at the same performance threshold as PC Support. The Time Slice is 500 milliseconds which is adequate for interactive sessions like SNA•ps 5250.

If the SNA•ps 5250 program call is made to a standard set of entries in QCMN, the results would be to use the QBATCH Class which would perform slower than a PC Support WorkStation Function emulation.

If the user logs on to the AS/400, then a job starts in the Interactive Subsystem or QINTER. All jobs managed by the QINTER subsystem use the QINTER Class. This Class has a Run Priority of 20 and a Time Slice of 2000 milliseconds. From this we can see that a SNA•ps 5250 connection will be running with priority 20 in the QINTER subsystem but then have to wait, on a busy machine, for time to complete the data transfer through the QCMN subsystem since it has a priority of 50 there. PC Support 5250 sessions do not have this delay since both jobs running on their behalf have priority of 20. (Remember 20 is better than 50.)

How to add the Routing entry to QCMN subsystem for SNA•ps 5250:

In order to configure the QCMN routing entries to improve performance on heavily loaded machines do the following steps. Log on as QSYSOPR or QSECOFR. Be sure all users on the QCMN subsystem have been warned with a broadcast message that the subsystem will be going down and all passthru sessions will be terminated. Stop the QCMN subsystem at the AS/400 console. Enter the following command on the command line:

```
ADDRTGE SBSD(QCMN) SEQNBR(180) CMPVAL(QPAPAS 37) PGM(*RTGDTA) CLS(QWCPCSUP)
```

The Sequence number has to be a number which is not currently in use by the subsystem. The compare value is the name QPAPAS which is the name of the Passthru program in the PGMEVOKE call. The class QWCPCSUP is an IBM supplied Class with Run Priority of 20. However, a new Class could be configured with a different Run Priority than 20 but this is not really necessary.

Changing Routing Entries For DAL For The AS/400

The DAL Server call is made to the routing entries of the QCMN subsystem just like the SNA•ps 5250 Passthru call. The DAL call is routed through the generalized PGMEVOKE 29 location and acquires the Class of that routing entry. The IBM default for this routing entry is QBATCH Class which has Run Priority 50. If DAL is compared with a PC Support connection (Run Priority 20 which is higher and therefore providing better service), DAL will come out slower that any PC Support driven process. One fix is to change the Class of the PGMEVOKE 29 routing entry to something with a Run Priority of 20. This may not be the best solution for the overall AS/400 since all program calls which are only qualified by PGMEVOKE will be given an interactive process Run Priority. DAL as an interactive process should be running with at least a Run Priority of 20.

Adding A Prestart Job For DAL In Subsystem QCMN

As an alternative to altering the Class of the PGMEVOKE 29 routing entry, it makes more sense to define a new Class, like DALCLS and define a Run Priority and Time Slice that makes sense. Use the CRTCLS AS/400 command and a Prompt Key and use the following as an example:

```
>>>>>>>>>>>>>>>>>>>>
```

```
                          Display Class Information
                                                          System:  APPLE SR
 Class . . . . . . . . . . . . . . . . . . . . :   DALCLS
   Library . . . . . . . . . . . . . . . . . . :     QGPL
 Run priority  . . . . . . . . . . . . . . . . :   20
 Time slice in milliseconds  . . . . . . . . . :   3000
 Eligible for purge  . . . . . . . . . . . . . :   *YES
 Default wait time in seconds  . . . . . . . . :   30
 Maximum CPU time in milliseconds  . . . . . . :   *NOMAX
 Maximum temporary storage in K bytes  . . . . :   *NOMAX
 Text  . . . . . . . . . . . . . . . . . . . . :   Class for DALServer
```

```
>>>>>>>>>>>>>>>>>>>>
```

Notice the Run Priority of 20 (more like interactive) and Time Slice of 3000 milliseconds (more like a batch process).

Next, a Prestart Job should be added to the QCMN Subsystem. Enter an

ADDPJE command on the AS/400 and the Prompt Key. The example below should be used as a template to fill in the screen:

>>>>>>>>>>>>>>>>>>>

```
                      Display Prestart Job Entry Detail
                                                        System:  APPLE SR
Subsystem description:   QCMN           Status:   ACTIVE

Program  . . . . . . . . . . . . . . . . . . . . :   DALSERVER
  Library  . . . . . . . . . . . . . . . . . . . :     DALLIB
User profile . . . . . . . . . . . . . . . . . . :   QUSER
Job  . . . . . . . . . . . . . . . . . . . . . . :   DALSERVER
Job description  . . . . . . . . . . . . . . . . :   *USRPRF
  Library  . . . . . . . . . . . . . . . . . . . :
Start jobs . . . . . . . . . . . . . . . . . . . :   *YES
Initial number of jobs . . . . . . . . . . . . . :   3
Threshold  . . . . . . . . . . . . . . . . . . . :   2
Additional number of jobs  . . . . . . . . . . . :   2
Maximum number of jobs . . . . . . . . . . . . . :   *NOMAX
Maximum number of uses . . . . . . . . . . . . . :   200
Wait for job . . . . . . . . . . . . . . . . . . :   *YES
Pool identifier  . . . . . . . . . . . . . . . . :   1
Class  . . . . . . . . . . . . . . . . . . . . . :   DALCLS
  Library  . . . . . . . . . . . . . . . . . . . :     QGPL
  Number of jobs to use class  . . . . . . . . . :     *CALC
Class  . . . . . . . . . . . . . . . . . . . . . :   *NONE
  Library  . . . . . . . . . . . . . . . . . . . :
  Number of jobs to use class  . . . . . . . . . :     *CALC
```

>>>>>>>>>>>>>>>>>>>

The most important entries on this screen are:

1) Program name - DALSERVER
2) Library Name - DALLIB is the DAL install default
3) Initial number of Jobs should be kept at the default of 3
4) The Additional number of Jobs should be kept at 2 which is the value used to determine how many additional jobs to start after the initial number are started and used.
5) Maximum number of jobs stays at *NOMAX
6) The Class should be DALCLS which is in library QGPL. This is the Class we just created for the DALSERVER and it will be used with the Prestart Job entry in Subsystem QCMN.

When the DAL process starts now, it will start faster and have a Run Priority of 20 which will place it on the same level as PC Support and Showcase VISTA, an AS/400 database query tool, which is competing with DAL.

Let's test this enhancement for DAL. If we connect a DAL client to the AS/400 and then do a WRKACTJOB on the AS/400, we see that a job has been started for the DALSERVER as a PJ (Prestart Job) in Subsystem QCMN.

```
>>>>>>>>>>>>>>>>>>>

Opt  Subsystem/Job  User        Type  CPU %  Function        Status
     QBATCH         QSYS        SBS      .0                 DEQW
     QCMN           QSYS        SBS      .0                 DEQW
       DALSERVER    QUSER       PJ       .0                 CPCW  <<<DAL
       TKNAXTC      XCOM        EVK      .0  *  -PASSTHRU    EVTW
     QCTL           QSYS        SBS      .0                 DEQW
       QSYSSCD      QPGMR       BCH      .0  PGM-QEZSCNEP    EVTW
     QINTER         QSYS        SBS      .0                 DEQW
       QPADEV02     QSECOFR     INT      .0  CMD-WRKACTJOB   RUN
     QSPL           QSYS        SBS      .0                 DEQW

>>>>>>>>>>>>>>>>>>>
```

If we work with the details for DALSERVER connection (option 5) and then display the run attributes of the Job (option 3), we see that the DALSERVER now has the Class privileges of DALCLS (RP of 20 and TS of 3000 ms):

```
>>>>>>>>>>>>>>>>>>>

Job:   DALSERVER      User:   QUSER          Number:   019163

Run priority  . . . . . . . . . . . . . . . . . :   20
Time slice in milliseconds  . . . . . . . . . . :   3000
Eligible for purge  . . . . . . . . . . . . . . :   *YES
Default wait time in seconds  . . . . . . . . . :   30
Maximum CPU time in milliseconds  . . . . . . . :   *NOMAX
  CPU time used . . . . . . . . . . . . . . . . :     5335
Maximum temporary storage in K bytes  . . . . . :   *NOMAX
  Temporary storage used  . . . . . . . . . . . :     6

>>>>>>>>>>>>>>>>>>>
```

Another DAL For AS/400 Performance Enhancement

It is possible to place the DALSERVER in AS/400 main storage and have it load more quickly at program start time and perhaps program execution time depending on the available RAM space in the selected pool. The AS/400 command is SETOBJACC (Set Object Access). The function of SETOBJACC is shown below from the AS/400 help screen on this command.

> The Set Object Access (SETOBJACC) command temporarily changes the speed of access to an object by bringing the object into a main storage pool or purging it from all main storage pools. An object can be kept main storage resident by selecting a pool for the object that has available space and does not have jobs associated with it. Repeated use of the command can cause a set of objects to be resident in a main storage pool.

The command entry screen for SETOBJACC is shown below filled in with the

default DAL values.

>>>>>>>>>>>>>>>>>>>

Set Object Access (SETOBJACC)

Type choices, press Enter.

```
 Object . . . . . . . . . . . . . > DALSERVER     Name
   Library  . . . . . . . . . . . >   DALLIB      Name, *LIBL, *USRLIBL...
 Object type  . . . . . . . . . . > *PGM          *FILE, *PGM
 Storage pool:
   Shared pool or subsystem name  > *BASE         Name, *JOB, *BASE...
   Pool identifier  . . . . . . . > 2             1-10
```

>>>>>>>>>>>>>>>>>>>

After this command has been done the following appears on line 25 of the 5250 screen:

"3K of DALSERVER brought to pool with 9K unused".

The DALSERVER is now launched by the AS/400 as quickly as possible. It is a Prestart Job in the QCMN subsystem and it is resident in a Main Storage pool. These suggestions should enhance DAL for AS/400 performance on very busy or smaller AS/400s (9402 and 9404 models).

SCSI Terminators: Use at Both Ends of SCSI Chain (7/93)

Revised: 7/2/93
Security: Everyone

SCSI Terminators: Use at Both Ends of SCSI Chain (7/93)

==========

Article Created: 1 July 1993

TOPIC ----------

I bought an AppleCD 300 drive to use with my Performa 450. The Apple dealer sold me a SCSI cable to connect the two and everything seems to work fine. However, the CD manual says I need a terminator connected to the CD-ROM drive. Is this true?

DISCUSSION ----------

With the proper cables, you need a terminator on the beginning of the SCSI chain, as well as one on the end. The internal hard drive is the beginning of the chain, so it's already terminated. Whatever is the last (or only) external device should be terminated. Failure to do so could possibly cause data integrity issues.

In other words, you should get a terminator for your CD-ROM drive. It may be working fine now, but at some point a CD may not mount successfully, or you may experience errors reading from the drive.

Performa: Backing Up and Restoring (7/95)

Revised: 7/11/95
Security: Everyone

Performa: Backing Up and Restoring (7/95)

==========

Article Created: 21 June 1993
Article Reviewed/Updated: 10 July 1995

TOPIC ----------

This article describes the backup and restore process on Macintosh Performa computers. Many later Performa computers come with the Performa Backup CD. Computers that include the Performa Backup CD are:

Macintosh Performa 550 (later versions)
Macintosh Performa 575, 577, 578
Macintosh Performa 630CD, 635CD, 636CD, 637CD, 638CD
Macintosh Performa 5200 series
Macintosh Performa 6110CD, 6112CD, 6115CD, 6118CD

This disc contains all the software that is pre-loaded on your hard drive including system software and third party programs. If you have this disc, it is not necessary for you to run the Apple Backup program to back up your pre-loaded software. However, you should still back up your personal files and any other software you add later.

DISCUSSION ----------

Using Apple Backup

Before you begin, make sure your computer is turned on and you are in the Finder. Follow these steps:

First, you need to buy high-density 3.5-inch floppy disks. Because Performa computers are bundled with different software at different stores, you need to determine how many disks you need.

To find out how many disks you need:

1) Click on the Apple Backup Icon in the Launcher.

2) Click the Continue button.

3) The screen now tells you how many disks you need to perform the backup of your Performa computer. There are two numbers on the screen, one number is how many disks it takes to back up EVERYTHING on your hard drive. The other number is the number of disks it takes to back up ONLY the System folder. If you choose to backup the entire hard disk, you do not have to backup the System folder by itself.

4) Once you know how many disks you need, click the Quit button.

Steps To Backup
---

1) Click the Apple Backup icon.

2) Click the Continue button.

3) Make sure your disks are high-density floppy disks. The screen indicates how many disks are required to copy everything, or just the system information.

- If you have enough floppy disks to copy everything, click the Copy All Files button.
- If you only have enough floppy disks to copy the System information, click the Copy System Folder button. Copy everything later when you have enough disks for the job.
- If you don't have enough disks for either option, click Quit, and back up later.

4) Insert a high-density floppy disk into the disk drive. (Don't use the utilities floppy disk that came with your computer.)

5) Follow the instructions on the screen until a message tells you that you're finished. As you remove each floppy disk from the computer, the program tells you how to label it.

6) When you're finished, be sure the floppy disks are properly labeled and locked, then store them in a cool, safe place.

7) Remember to back up your hard drive at least once a month.

Additional information on performing Apple Backup is available in the Owner's Manual that came with your Macintosh Performa computer.

Using Apple Restore

If the information on your hard disk becomes lost or damaged by a crash, you can restore the information with the data on the disks you created using Apple Backup. You can also use the Performa Backup CD to restore your system software

or the third party programs that were installed on your hard drive originally.

1) Get the floppy disk labeled Utilities that came with your computer. Also make sure the disks containing the backup copy are available.

2) Make sure the Macintosh is off.

3) Insert the Utilities disk in the floppy drive, then turn on your Macintosh.

4) Locate the Restore icon on the disk.

5) Open Apple Restore by double-clicking its icon.

6) Read the information on the screen, then click Continue.

7) Insert the disk labeled 1.

8) REPLACE newer items with the older ones on your backup disks. This copies older files, but erases newer files which may be corrupted. Saving the newer files may result in another crash.

   Note: You don't want to replace personal files on your hard disk such as word processing documents. If you replace those files, and if you have changed those documents on your hard disk since your last backup, the older version of the document is placed on your hard disk. You generally want to select Keep Newer on personal files.

9) Repeat steps 7 and 8 for the other backup disks.

10) When you are finished, Apple Restore displays One of two messages, depending on the version of Apple Restore you are using:

   A) "Please insert the disk you used to start up your Macintosh". Insert the utilities disk, and it returns you to At Ease or the Finder. Once you are in either the Finder or At Ease, you need to select Restart from the Special menu.
   B) "You have successfully restored your files". Clicking the restart button, restarts your computer.

Additional information on performing Apple Restore is available in the Owner's Manual that came with your Macintosh Performa computer.

This article is one of many available through the Apple Fax center. For a complete list of available fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature). The Apple Fax center is available free of charge 24 hours a day, 7 days a week.

LaserWriter IIg: Won't Print Tilde and Apostrophe (8/95)

==========

Article Created: 2 July 1993
Article Reviewed/Updated: 22 August 1995

TOPIC ----------

I upgraded my LaserWriter IINT to a LaserWriter IIg. The IIg will not print any apostrophes or tildes. I can replace the printer's logic board with a IINT and it will print the tilde and apostrophe.

DISCUSSION ----------

Try removing New Century Schoolbook font and rebooting. The New Century Schoolbook font that ships with the IIf/IIg is damaged. This font will cause the tilde and apostrophe to fail to print.

Reinstall the font from the Font Pack diskettes rather than from the LaserWriter Pro or LaserWriter IIf disks.

Macintosh PC Exchange 1.0.3: Using with Other Applications

Revised: 7/2/93
Security: Everyone

Macintosh PC Exchange 1.0.3: Using with Other Applications

==========

Article Created: 1 July 1993

TOPIC ----------

Macintosh PC Exchange lets you use PC-formatted floppy disks on your Macintosh. It lets you transfer files between a Macintosh and a PC-compatible computer by copying the files to and from a floppy disk. This article tells you what you need to install Macintosh PC Exchange 1.0.3, and to use it with other types of programs.

DISCUSSION ----------

What You Need to Install Macintosh PC Exchange

To use Macintosh PC Exchange, you must have Macintosh system software version 7.0 or later. Macintosh PC Exchange doesn't work with system software version 6.

If you've already installed another PC disk mounting utility in your Macintosh, be sure to remove it before installing Macintosh PC Exchange. Then drag the PC Exchange icon into the Control Panels folder of your System Folder, and restart the Macintosh.

Notes on Using Macintosh PC Exchange

If you change the name of a PC-format disk to a name that's longer than 11 characters, the disk name will be truncated when you view it on a PC-compatible computer.

If Macintosh PC Exchange encounters a problem while formatting a disk, an Updating Disk... dialog may appear. This dialog includes a progress bar that shows the status of the updating process. To stop the disk from being updated, click the Cancel button. This cancels the initialization process, and the disk ejects from the disk drive.

In the PC Exchange control panel, you can't create an assignment with a blank DOS suffix.

Sometimes a Macintosh application program can't interpret the file format of a PC document. When this happens, the document's formatting displays incorrectly, and you may see strange characters in the document. When this happens, try using another application, or translate the document into a different file format using one of the file format translation utilities available for the Macintosh (like MacLinkPlus Translators from DataViz).

Paint Programs

Some paint programs, like MacPaint and SuperPaint, save documents onto PC-format disks very slowly. To get around this, always save paint documents onto your computer's hard disk. If you like, you can then copy the document onto a PC-format floppy disk.

ClarisWorks Version 1.0v2 or Earlier

Some versions of ClarisWorks can't read or write files on PC-format disks. To open a PC document in ClarisWorks, you must first copy the document onto the hard disk. Always save ClarisWorks documents onto your hard disk. Contact Claris to obtain version 1.0v3 or later.

AutoDoubler

To use AutoDoubler with Macintosh PC Exchange, you must first open the AutoDoubler control panel and remove the X from the box labeled "Show DD on Compressed Files."

Directory Assistance II

You shouldn't use this program while the Macintosh PC Exchange control panel is open. You can turn off Directory Assistance II from the PC Exchange control panel by holding down the Option key while you click the Add or Change buttons in the control panel window. Using the PC Exchange control panel temporarily disables Directory Assistance, and closing the PC Exchange control panel automatically enables it.

LaserWriter Page Setup: Options Locks Up the Finder (7/93)

Revised: 7/2/93
Security: Everyone

LaserWriter Page Setup: Options Locks Up the Finder (7/93)

==========

Article Created: 1 July 1993

TOPIC ----------

My Macintosh freezes whenever I select "options" in the LaserWriter Page Set Up dialog box while in the Finder.

DISCUSSION ----------

This happens on Macintosh computers running System 7.0.x or 7.1, when the Network Extension, a third-party extension such as SAM Intercept 3.0.8, is installed, AND 32-bit addressing is turned on. With the Finder in a low-memory configuration (such as when millions of colors are being displayed and/or Finder windows are open), the additional memory required to draw the "Option..." dialog box causes the computer to freeze.

Any ONE of these workarounds will help circumvent the problem:

- Only open Page Set Up options from within an application (not in Finder).
- Turn off 32-bit addressing.
- Turn off extensions.
- Eliminate the causes for the low-memory condition in the Finder (reduce the bit depth of the colors or select "black & white" and close open windows).
- Upgrade to LaserWriter driver 7.2 or later.

We duplicated the problem with LaserWriter driver 7.1.2 (which comes with system software 7.1). However, we also heard that customers were having the problem with system 7.0 drivers (which would be LaserWriter drivers 7.0, 7.1, and 7.1.1).

This problem has been fixed with LaserWriter driver version 7.2 and later. The driver now allocates memory for the options dialog from the system heap instead of the Finder heap IF the free memory in the Finder falls below a

fixed limit (now set at 8K).

SNA•ps Release 2.0 & SNA•ps 5250 Question and Answer (7/93)

Revised: 7/7/93
Security: Everyone

SNA•ps Release 2.0 & SNA•ps 5250 Question and Answer (7/93)

==========

Article Created: 2 July 1993

TOPIC ----------

This article contains questions and answers about SNA•ps Release version 2.0 and SNA•ps 5250.

DISCUSSION ----------

Q: What is in SNA•ps Release 2.0?
A: The SNA•ps Release 2.0 is a release which contains a new product updated SNA•ps Gateway, SNA•ps Admin, SNA•ps Config and 3270 Manager. There is also an updated SNA•ps 3270 Application.

Q: What is new and different?
A: The new SNA•ps gateways are now sold on the basis of connected AppleTalk User clients, not the number of sessions as with the 1.1.1 release and earlier. The old session limits of 5 (personal gateway), 8, 32 and 64 have been replaced by:

- Personal Gateway (0 external clients), only internal connections in the same machine with coax, Token Ring or SDLC card.
- 10, 35 and 70 connected client limited gateways.

There is no limit to the number of sessions each gateway can support except RAM limitations on the MCP card (Token Ring or SDLC), or 5 sessions maximum for Coax card, or NCP limits in SNA.

The Personal gateway does project a Gateway name on the AppleTalk network but any remote client that tries to attach will be told with a dialog box that "no clients can attach at this time". Also, if a remote SNA•ps Admin tool tries to open a Personal gateway, it will not be

allowed, since the Personal Gateway will not accept any SNA•ps Access clients (3270 Manager, SNA•ps Admin, SNA•ps 3270, SNA•ps 5250, SNA•ps 3287 or SNA•ps Print). The SNA•ps Admin tools will only control a Personal gateway if the tool is run in the same machine as the Personal gateway.

The SNA•ps Admin version 2.0 tools can "see" and manage all versions of the gateway (1.1, 1.1.1 and 2.0). However, the 1.1.1 or 1.1 versions of SNA•ps Admin tools can "see" but cannot manage any 2.0 gateway. 1.0 version gateways, can only be managed by 1.0 SNA•ps Admin tools.

Q: What was fixed?
A: The SNA•ps 2.0 gateways now remember the SNA•ps Preferences when a gateway (most often a Personal gateway) is used in a Duo Dock and a PowerBook Duo. The situation is the Duo is loaded with SNA•ps gateway code and configured as an active gateway. The Duo is then shutdown and ejected from the Dock and restarted. The Duo does not now have a "real" NuBus so the SNA•ps Preferences are kept (in 2.0 gateways) until a "real" NuBus returns. So, if the Duo is re-inserted in a Dock with the same kind of NuBus card in the same slot, the gateway preferences are recalled and gateways will automatically restart. This does not change the SNA•ps Preferences being cleared when a NuBus MCP card is removed from the bus and the Macintosh restarted. The SNA•ps Preferences only clear if the Macintosh has a "real" NuBus and the preferences match a slot which is empty, or filled with a different NuBus card.

Q: What was not fixed or added?
A: The performance issue with high speed SDLC links (19.2Kbps and above) has been tested but was not included in Gateway 2.0. Also the LU Security feature was not included in Gateway 2.0.

Q: What bugs have been discovered?
A: The only bug that has been discovered so far is with System 6.0.X Macintosh computers running DAL client 1.3.7 and the DALnet adapters for SNA•ps APPC. If the System 6.0.X computer tries to make an APPC connection through a 2.0 gateway running APPC to an AS/400, the DALSERVER program call has the AS/400 Library name stripped by the SNA•ps 2.0 gateway. The DAL connection fails with a -4105 error "Open Gateway Connection Failed". The result is that DAL clients on a 6.0.4 system cannot access DAL for the AS/400 through 2.0 gateways. This is a very repeatable problem. DAL 1.3.7 in System 6.0.X computers work just fine to APPC VTAM and all 3270 connections. DAL 1.3.7 in System 7.0 computers work properly everywhere.

Another problem seems to be related to confusion in the SNA•ps gateway client user counting when a DAL connection is made to a host resource which is fully in use. For example, suppose a 3270 gateway has 6 display sessions and 4 printer sessions configured on a 10 user gateway. Also assume that all 6 display sessions are in use with SNA•ps 3270 sessions and no printer sessions are in use. If a DAL attachment is

attempted to the 3270 session pool, the report to the DAL client application has been "no clients available at this time" when in fact clients can still attach to the gateway for printer sessions. This is not unexpected but occasionally, the 2.0 gateway remains confused and continues to report "no clients can attach at this time" even to resources which are available (like to printer sessions). This does not consistently happen but when it does the Gateway Macintosh computer must be restarted. Stopping and starting the gateway with SNA•ps Admin will not result in a recovery from this problem.

This second problem applies to DAL in 6.0.x and 7.0 computers and with 3270 and APPC sessions. It is not solidly repeatable. It looks like a problem with DAL client or DALnet adapters and SNA•ps Access 2.0. The only way to get this to happen is to have DAL try to access an out of session resource (3270 or parallel sessions in APPC) when there is space for a client at the 2.0 gateway. A workaround is to be sure there are more 3270 and/or APPC sessions than the number of client user limits for the gateway 2.0.

Q: What is the SNA•ps 3270 1.1.2 in the 2.0 gateway package?
A: SNA•ps 1.1.1 has a "divide by zero" bug which seems to occur if the user selected "any screen size" (Model 2-5 is fine) in the connection dialog and the host LOGMODE presented an unusual combination (for example, primary screen Mod-3 and alternate screen Mod-4). A parsing error by the SNA•ps 1.1.1 code resulted in the divided by zero bug. This was the only thing fixed in SNA•ps 3270 1.1.2. A code patcher for SNA•ps 3270 1.1.1 should be available in mid-July 1993.

The workaround for this bug in SNA•ps 3270 1.1.1, is to select a specific model terminal (like 2) and then the LOGMODE with either match and BIND or not match and UNBIND. No "divide by zero" will result.

Q: What is SNA•ps 5250?
A: The SNA•ps 5250 product is an AS/400 only terminal emulator, which uses the Display Station Passthru features of the AS/400 to provide 5250 terminal emulation. It uses the parallel session services of a SNA•ps 2.0 (1.1.1 or 1.1) APPC gateway, which can be attached directly to an AS/400 over Token Ring, SDLC, or as a downstream PU on the Token Ring gateway feature of an IBM 5494 mid-range remote controller (SDLC). SNA•ps gateways are LEN nodes, and can be used in APPN networks, common in AS/400 environments.

SNA•ps 5250 is a fully featured workstation emulation similar to that offered by PC Support to DOS and Windows users. It does not use PC Support to make connections to the AS/400. The only major feature which is missing in SNA•ps 5250 is File Transfer. There are no major reported bugs on SNA•ps 5250 version 1.0

Q: What is SNA•ps Print?
A: SNA•ps Print is a multi-purpose printer emulation for both 3270 and 5250

printers. The 3270 mode is similar to SNA•ps 3287 and uses the 3270 API. SNA•ps Print corrected many bugs in SNA•ps 3287 especially all LU1 (SCS) tabbing problems with LaserWriters and ImageWriters. There is now support for defining Characters per Inch across the page.

5250 printers are supported to the AS/400 only as Printer Station Passthru devices over a SNA•ps APPC gateway. Only the 3812 printer is supported. The actual printer name on the Passthru controller must be inserted in the SNA•ps 5250 Control Panel or the SNA•ps Print client will not connect properly. SNA•ps Print for 5250 uses the Apple 3270 API.

There are two major reported bugs in SNA•ps Print. One is a problem with Lines per Inch not working at all in the Custom Format Set-up. The choices are six or eight and SNA•ps Print ignores either setting and prints seven Lines per Inch. This should be fixed in the next maintenance release in the Fall of 1993. The other bug has to do with ImageWriters and properly spacing Characters per Inch. This appears to be an ImageWriter driver bug and the only thing to do as a workaround is to "trick" the driver and give it a smaller CPI and let the print driver expand the line to the desired size. We have experimented and a CPI of 9.2 set in SNA•ps Print results in a CPI of 10 on the printed page. There is no problem with CPI and LaserWriter printers.

Copyright 1993, Apple Computer, Inc.

LaserWriter IIg: Not Communicating with IBM (8/95)

Revised: 8/23/95
Security: Everyone

LaserWriter IIg: Not Communicating with IBM (8/95)

==========

Article Created: 7 July 1993
Article Review/Updated: 23 August 1995

TOPIC ----------

I replaced my LaserWriter IINT with a LaserWriter IIg. My IBM is having trouble communicating with the IIg printer. I can send 1 page of PostScript, but anything longer than that gives me an I/O error. I see the I/O error only when I use my communications program.

Do the communication parameters need to be changed? Currently I'm using the same parameters as I did for my LW IINT. How can I set options for different parameters (baud rate, parity, data bits, stop bits, flow control, protocol, mode) on the printer?

DISCUSSION ----------

The printing problem is caused by different communications settings on the IBM and the IIg. The IINT manual recommends serial settings of 9600, N, 7, and 1 (page 113). The IIg manual does not recommend a specific serial setting, but does provide a table of switch configurable settings (page 101). Unfortunately, there is not a switch setting on the IIg that matches the IINT recommended setting. Fortunately, we can bridge the gap:

1) The easiest method is to select one of the user-definable configuration options (page 101 of the LaserWriter® IIf and IIg Owner's Guide) on the IIg that most closely resembles those desired and change the IBM PC to match. Switch position 7 would only require changes to the baud rate and data bits and the following PostScript code could then be used to change those settings:

```
(%Serial_NV2%)
<< /Baud 9600
  /DataBits 7
```

NOTE:
All options available for manipulation are:

/Baud 300, 600,1200, 1800, 2400, 3600, 4800, 7200, 9600, 19200, or 57600
/DataBits 7 or 8
/Enabled /true or false
/FlowControl /XonXoff, Dtr, or EtxAck
/Interpreter /PostScript or LaserJetIIP
/On /true or false
/Parity /Odd, Even, or None
/Protocol /Normal, Raw, or Binary
/StopBits 1 or 2

2) Unfortunately, the IIg does not possess a switch to place the printer in Interactive PostScript mode like the IINT. However, the IIg can be placed in Interactive PostScript mode by opening a terminal session between the IBM PC and the IIg, and then invoking the executive PostScript language procedure. (That is, type ‘executive’ followed by return or line-feed. NOTE: Since the server is still in batch mode, the characters you type are not echoed back to you. Once this is done, a PostScript herald and prompt should appear.) The user can return to batch mode by invoking the quit operator or entering a Control-D.

Article Change History
23 Aug 1995 - Made minor corrections.
07 Dec 1993 - Revised and corrected the PostScript code.

Portable StyleWriter: Problems Indicated by LEDs (6/93)

Revised: 7/6/93
Security: Everyone

Portable StyleWriter: Problems Indicated by LEDs (6/93)

==========

Article Created: 6 July 1993

TOPIC ----------

This article describes problems indicated by the Portable StyleWriter lights.

DISCUSSION ----------

Power light	On Line light	Error light	Problem indicated
Off	Off	Off	The power adapter is not correctly connected, or the printer is not turned on.
On	Off	On	(The printer beeps 2 or 3 times.) The printer is out paper.
On	Off	On	(The printer beeps continuously.) Paper is jammed or paper longer than 15 inches has been loaded.
On	Off	Blinks	(The printer beeps continuously.) The ink cartridge has not returned to home position. Turn printer off, wait a few seconds, then turn it on.
On	Blinks	Off	(The printer beeps 5 times.) An error occurred in the printer. Turn off the

			printer, wait a few seconds, then turn it on.
On	Blinks	Off	(The printer beeps continuously.) An error occurred while the printer started up. Turn off the printer, wait a few seconds, then turn it on.
On	Blinks	Blinks	(The printer beeps 3 times) Turn off the printer, wait a few seconds, then turn it on.
Blinks	Off	Off	(The Power light blinks once every second.) The battery is being charged.
Blinks	Off	Off	(The Power light blinks once every half second.) The battery is low.
Blinks	Off	On	(The printer beeps 5 times, and the Power light blinks once every half second. After 5 minutes, the printer beeps again, then turns off automatically.) The battery has run out of power.
Blinks	Off	Blinks	(The printer beeps 5 times, and the two lights blink alternately.) There is a problem with the battery. Charge the battery two or three times. If the problem continues, replace the battery with a new one.

System 7.x: Moving the Cursor with the Numeric Keypad (7/93)

Revised: 7/9/93
Security: Everyone

System 7.x: Moving the Cursor with the Numeric Keypad (7/93)

==========

Article Created: 6 July 1993

TOPIC ----------

I have trouble using the mouse to fine tune a picture I'm drawing. Can I use the keyboard to move the cursor?

DISCUSSION ----------

A feature that is part of the Easy Access control panel is called Mouse Keys. It enables you to use the numeric keypad to move the cursor just as you would with the mouse. To use this feature follow these steps:

1) Make sure Easy Access is installed in the Control Panel folder inside your System Folder.
2) On the keyboard hold down Command-Shift-Clear.
3) The 5 on the numeric keypad now works like the mouse button: press once to click and twice to double click.
4) The eight keys surrounding the number 5 are now directional keys (example: the 4 and 6 keys move the cursor left and right).
5) To click and drag, press the 0 key twice and then use the directional keys. Press the decimal point key twice to release the mouse button.
6) To return the numeric keypad to its normal function, hold down Command-Shift-Clear.

Note: You can find this information in the Owner's Manual that came with your computer.

System 7.x: File Sharing and QuicKeys (7/93)

==========

Article Created: 06 July 1993

TOPIC --

The following discussion describes file sharing capabilities using CE Software's Quickeys 2.1.3.

DISCUSSION ---

Two file sharing features of QuicKeys are Start FileSharing and Stop FileSharing. These features allow you to turn the file sharing function of System 7 on and off with a single keystroke, so that it's on only when needed.

Also, if you want to have the file sharing function turned on at certain times, QuicKeys has a QuicKeys Timer Option. For further information contact the vendor directly. To locate a vendor's address and phone numbers, use the vendor name as a search string.

ARA Through A Mellidyne Phone Switch (7/93)

Revised: 7/8/93
Security: Everyone

ARA Through A Mellidyne Phone Switch (7/93)

==========

Article Created: 6 July 1993

TOPIC ----------

This article describes using AppleTalk Remote Access (ARA) in conjunction with a Mellidyne Phone Switch to utilize the phone switches SecureID capabilities.

DISCUSSION ----------

To provide terminal sessions for PC users and AppleTalk services for PowerBook users without bypassing security, you can utilize the SecureID function that was part of the Mellidyne phone switch. You need to configure the ARA servers to function with a phone switch providing the link between the server box and modems being used. The particular ARA sever that was used in our testing was from Cayman Systems.

The first CCL that had to be modified was the user script. The prompt for valid user name and password (SecureID number) had to be added to the script. Also you need to modify the CCL to send the proper menu selection to direct the Mellidyne phone switch to patch the call to the proper port, provided user name and password are valid.

The Cayman ARA server had to be configured for a direct line hookup because the phone switch handles the configuration of the modems. Even though we only tested the Cayman ARA server we suspect that other server could be used as long as it supports a direct connection.

Another caveat is that auto baud (modem speed matching) did not work, we had to specify the speed in the phone switch as well as the ARA server configuration. We didn't see this as a problem because we want to standardize on one type of modem and speed. If we have to change in the future we can add this selection to the user script and then have specific ports with different speeds.

System 7.x: Map Control Panel (7/93)

==========

Article Created: 06 July 1993

TOPIC ----------

This article describes the uses of the Map Control Panel.

DISCUSSION ----------

Open the Map Control Panel located within the Control Panel folder inside your System Folder. If the map is black-and-white, open up the Scrapbook under the Apple Menu. Locate and copy the color map. Then go back to the Map Control Panel and Paste.

- Scroll around the map by clicking in the map and then dragging outside its boundaries.
- To find a city, type the name of the city and click on the Find button.
- To add a city, type in its name, click on its location, and click on the Add City button.
- The mileage display normally shows the distance between the last location you clicked and the present one. If you always want the distance displayed to be the distance between your home town and the current location, click on your town, then click the Set button.
- The Time Zone shows the difference between your current location and Greenwich mean time. If you wish to know the time difference between your previous and current location, click on the words Time Zone and it will switch to Time Differ.
- To see a more magnified version of the Map, hold the Option key down as you double click to open the Map control panel.

Revised: 7/9/93
Security: Everyone

System 7.x: Organizing the Desktop (7/93)

==========

Article Created: 07 July 1993

TOPIC ----------

This article describes the way the Clean Up command works in System 7, making it easier to organize your desktop.

DISCUSSION ----------

Here are some tips for organizing the desktop:

- With any window open at the desktop level, hold down the Option key and select Clean Up All from the Special menu. This will arrange all the icons in a neat row in the upper right corner of the window.

- By combining the Clean Up command with the View menu, you can straighten up and organize the window by name, size, kind, label, or date. For example, choose by Name from the View menu. Now switch to by Icon view, hold down the Option key, and select Clean Up by Name from the Special menu. You will see the icons neatly arranged in alphabetical order.

- To sort just a few icons, select the ones you want to organize, hold down the Shift key, and select Clean Up Selection from the Special menu.

Startup Items Folder: Sound Or Control Panel Cause Crash (10/95)

Revised: 10/17/95
Security: Everyone

Startup Items Folder: Sound Or Control Panel Cause Crash (10/95)

==========

Article Created: 6 July 1993
Article Reviewed/Updated: 17 October 1995

TOPIC ----------

When I place both a sound and a control panel (or aliases to either) in the Startup Items folder, the Macintosh sometimes crashes while booting up. I installed System 7.5 but the problem remains.

DISCUSSION ----------

If a sound file opens at the same time or just prior to opening a control panel, this can cause a system crash. You may want a sound file in the Startup Items folder so the Macintosh plays the sound every time you turn your Macintosh on. The same problem can occur on a Performa if you use the Launcher and want to have a startup sound. This problem was fixed in System 7.5 Update 1.0 which is posted on online services.

This crash will corrupt the system file requiring you to startup from a floppy disk or CD-ROM disc, drag the System suitcase from the System Folder on your hard drive to the trash, and reinstall system software. After reinstalling the system software, remove the control panel and sound file from the Startup Items folder before restarting your computer.

The only solutions are:
- Remove either the sound or the control panel from the Startup Items folder.
- Use a third-party product such as NOW Fun or Sound Master to play the startup sound.
- Install System 7.5 Update 1.0.

These articles can help you locate the System 7.5 Update 1.0 mentioned here:

- "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.

• "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Article Change History:
17 Oct 1995 - Added System 7.5 Update 1.0 information.
09 Jan 1995 - Added fix with next System Update.

QuickTime Movie Exchange Toolkit Formats (7/93)

Revised: 7/7/93
Security: Everyone

QuickTime Movie Exchange Toolkit Formats (7/93)

==========

Article Created: 6 July 1993

TOPIC --------------------

I work with digitized video and other media on several platforms. I'd like to use QuickTime Movie Exchange Toolkit. What formats does the QuickTime Movie Exchange Toolkit support? What are all the formats that can be read from and written to on each platform?

DISCUSSION --------------------

The QuickTime Movie Exchange Toolkit provides three applications:

- makemoov for Unix systems
- makemoov.exe for MS-DOS systems
- aamoov.exe for MS-DOS systems

The two makemoov applications accept the simplest possible file format, a raw stream of bytes, each representing a single color. It doesn't matter which computer is in use, the following formats are the only ones the makemoov applications support:

- RGB triples, one byte per color; three bytes per pixel
- Gray-scale data, one byte per pixel
- Pseudo-color data, one byte per pixel

You can add sound to a makemoov movie. The sound file needs to contain 22,254 6/11 linear samples per second with 0 as most negative, 128 as speaker at rest, and 255 as most positive.

The aamoov.exe is specifically for converting Autodesk Animator .fli files to QuickTime movies.

For the applications programmer, there's a C++ library (one for Unix and one

for MS-DOS) included with the Exchange Toolkit. Each library contains definitions of seven classes and a number of methods for adding QuickTime movie creation to your own application. If your application is capable of reading other file formats into memory, the library will provide tools for writing out a QuickTime movie.

The Toolkit creates only one type of output file -- a single fork QuickTime movie file format. On the Macintosh either a double fork or single fork QuickTime movie is acceptable to QuickTime.

Serial Printers: Choice of Serial Ports (7/93)

Revised: 7/7/93
Security: Everyone

Serial Printers: Choice of Serial Ports (7/93)

==========

Article Created: 6 July 1993

TOPIC ----------

I have a choice of serial ports for my StyleWriter II in the Chooser, but my printer will only work in the modem port (with the picture of the phone, and I have my modem hooked up to that one). When I connect to the printer port, it tells me to deactivate AppleTalk. I did this, but it still won't work. Do I have to unhook my modem every time I want to print something?

DISCUSSION ----------

You can use your StyleWriter II printer connected to either serial port in the back of your Macintosh -- printer port or modem port. What's important with the StyleWriter II, or any serial printer that isn't shared, is that the cable connections and the Chooser settings are the same, and that AppleTalk is turned off. You said that your StyleWriter II can print from the modem port, so the problem is either with the setup or with your computer.

Try setting up your StyleWriter II with the printer port again:

1) Connect the StyleWriter II cable to the printer port, and be sure that all of the connections are solid. Loose cable connections are the biggest cause of printer failures.
2) Open the Chooser and click on the StyleWriter II icon.
3) Make sure AppleTalk is Inactive.
4) Select the serial port with the picture of the printer.
5) For the time being, turn off Background Printing. This will cut down troubleshooting time until everything is working fine.

Now close the Chooser and try to print the picture of your hard drive. Open the icon, and then select Print Window... from the File menu. If it doesn't print, watch for any messages that the computer gives you, and follow the

instructions.

If you have done all of this correctly and are still unable to print, you may be running into a conflict with another program, an extension such as a screen saver, or something may be wrong with the printer port on your computer (not likely).

Locked Disk: You Can Copy From It But Not To It (7/93)

==========

Article Created: 6 July 1993

TOPIC ----------

I recently used Apple Restore to successfully restore my hard drive. I later discovered that the floppy disks I used to restore were protected. So I'm curious how a protected disk can be copied.

DISCUSSION ----------

A "protected" or "locked" disk, using the tabs on the back of the disk, means that its contents at that time can't be altered. You can copy information from it, but not to it.

Because you aren't altering the contents of the disk by copying information from it, the disk will allow you to copy. Therefore, your restore was successful because the Apple restore application had no problems getting the information it needed. If you ever tried to copy to the protected disks or use them with Apple Backup, you'd then run into a problem.

System 7.x: Removing Stubborn Control Panels (7/93)

==========

Article Created: 6 July 1993

TOPIC ----------

I have a control panel that alters my screen layout (colors, screen saver screens, and so on). I've thrown away the control panel, but I still can't get the regular Macintosh screen back. I tried rebuilding the desktop, and reinstalling the system software to no effect.

DISCUSSION ----------

Certain control panels, like MOIRE and AURORA, store information in the PRAM that isn't erased when the extension is thrown away. If you zap the PRAM and reboot, the unwanted information will disappear. This also resets the control panels to their default state, so you'll need to recreate any information you've personalized.

Search in the Tech Info Library for the title, "System 7: How to Reset Parameter RAM (PRAM)" for instructions.

AppleShare Client Software Compatible With System 6.0.x (7/93)

Revised: 7/7/93
Security: Everyone

AppleShare Client Software Compatible With System 6.0.x (7/93)

==========

Article Created: 2 July 1993

TOPIC ----------

I'm trying to make a bootable 800K floppy for my Macintosh Plus that has system 6.0.x and AppleShare client software so I can mount my file server.

AppleShare appears to be working fine until I get to the point of selecting the volume I want to mount. I get the message about the desktop file on the volume needing repair. When I click on "ok" to repair it, I get into a loop with the dialog box saying the desktop file couldn't be created and then there's nothing I can do but reboot.

I am using System 6.0.7 from the Disk Tools disk and tried it with AppleShare from System 7.0.1. What's going wrong?

DISCUSSION ----------

There is a compatibility problem when using System 7.0.x version of the AppleShare client software with System 6.0.x. System 7.0.x AppleShare client software should only be used on System 7.0.x systems.

System 7.1 AppleShare client extension and AppleShare 3.0.x client extension are compatible with System 6.0.x. The installer disks should be used to install one of these versions onto a 6.0.x system.

ARA Answer Problem With Dayna EtherPrint (7/93)

Revised: 7/7/93
Security: Everyone

ARA Answer Problem With Dayna EtherPrint (7/93)

==========

Article Created: 2 July 1993

TOPIC ----------

I'm getting the following error message when I try to turn on answering in AppleTalk Remote Access (ARA), "A Remote Access Setup error has occurred. Unable to acquire AppleTalk node on current network."

I'm on LocalTalk, connected to an EtherPrint. When I disconnected the LocalTalk cable from the Macintosh, everything worked OK.

DISCUSSION ----------

We checked with Dayna, and it turns out that they have seen this problem before. It may be due to ROM revisions in the EtherPrint. The best solution is to refer the customer to Dayna. Dayna Tech Support told us this can usually be solved by powering down the computer and the EtherPrint. Then set the EtherPrint to AppleTalk Phase 1, power it up, power it down again, reset it to AppleTalk Phase 2, and then power it back up again.

To locate a vendor's address and phone number, use the vendor name as a search string.

SNA•ps 1.1.1 and Macintosh IIvx Problem (7/93)

Revised: 7/8/93
Security: Everyone

SNA•ps 1.1.1 and Macintosh IIvx Problem (7/93)

==========

Article Created: 7 July 1993

TOPIC ----------

I'm having a problem with the SNA•ps 1.1.1 and the Macintosh IIvx.

Configuration:
- Computer: IIvx
- OS: US System 7.1
- RAM: 20MB
- Coax/Twinax card (512K) and SNA•ps 3270 1.1.1.

CUT: Connection can not be established. Error message is "error while communicating w/slot 1". Card was moved to slot 2, and error message is "error while communicating w/slot 2".

DFT: Gateway can not start. Error message is "Failure while starting the gateway. Sorry, not enough memory available on the card to run the gateway."

Notes: The above was tested on two different IIvx computers and two different cards with the same result. The same card was used on a IIci and IIsi with no problems.

DISCUSSION ----------

This is a problem with A/ROSE 1.1.8 which is on the SNA•ps 1.1.1 disks and the Macintosh IIvx. This is a known problem, and there are several fixes to this Macintosh IIvx specific problem:

- Change A/ROSE to 1.1.7 (Drag replace).
- Change A/ROSE to 1.1.9 (Drag replace).
- Use NSI 1.3.2 or higher posted on AppleLink which comes with A/ROSE 1.2 which specifically fixes the Macintosh IIvx problem.

Here is the path on AppleLink:

TOPIC ----------

I can't install the driver software for the Apple Adjustable Keyboard on my Macintosh. The Installer gives a message saying that the software to be installed is older than the software on the currently selected system, and it will not proceed further. Is there an updated version of the Apple Adjustable Keyboard Installer?

DISCUSSION ----------

The system software on your Macintosh is already properly configured to support the Apple Adjustable Keyboard.

There's no need to reinstall the Adjustable Keyboard resources unless you are reinstalling the system software on your Macintosh. If this is the case, remember to install the Adjustable Keyboard resources using the Installer.

You can double check that your Adjustable Keyboard has all of its functionality by either trying the volume buttons, or the forward delete key on the key pad.

LaserWriter Pro: Tray Switching and Manual Feed (4/97)

Revised: 4/14/97
Security: Everyone

LaserWriter Pro: Tray Switching and Manual Feed (4/97)

==========

Article Created: 8 July 1993
Article Reviewed/Updated: 14 April 1997

TOPIC ----------

How do you get a LaserWriter Pro 600/630 to take paper from the multipurpose/manual feed tray and the cassette trays if paper is present in all locations? The LaserWriter II was able to pick up paper from the manual feed tray and the cassette tray.

I have tried the LaserWriter 7.2 and 8.0 driver with the correct PPD and have experimented with the various options with no success.

DISCUSSION ----------

TraySwitching allows users to set up the printer to continue printing from the next available paper tray or stop printing and return an "Out of Paper" message when the tray being used runs out of paper.

We have a LaserWriter Pro 630 configured so that it takes paper from the default tray if there is paper present, and will switch to the other trays when the default tray runs out of paper. Here is how we are achieving it:

1) Use the LaserWriter 8.0 driver with the respective LaserWriter Pro PPD.

2) Download the following PostScript to the LaserWriter Pro (via LaserWriter Utility 7.4.1) to change the default paper tray:

This is PostScript Level 1 code:

```
%============================================================
% Begin PostScript Code
%
serverdict begin 0 exitserver
statusdict begin 1 setdefaultpapertray end
```

```
%
% End PostScript Code
%=========================================================
```

Note: Whenever the PostScript code "serverdict begin 0 exitserver" is downloaded to the LaserWriter, any commands that follow will automatically place the results in the printer's non-volatile RAM (NVRAM), meaning that the printer will retain the settings even when powered off.

The integer value before "setdefaultpapertray" corresponds to the various trays as follows:

Value	Tray Selection
0	250 Sheet Cassette
1	Multi-purpose tray
2	500 Sheet Cassette
3	Envelope tray

This is the equivalent PostScript Level 2 code:

```
%=========================================================
% Begin PostScript Code
%
serverdict begin 0 exitserver
1 dict dup /InputAttributes 1 dict dup /Priority [2 1 0] put put setpagedevice
%
% End PostScript Code
%=========================================================
```

This sets the paper tray priority to:
1st Priority - Cassette (500 Sheets) - designated by the "2" in the array above.
2nd Priority - Multipurpose Tray - designated by the "1" in the array above.
3rd Priority - Cassette (250 Sheets) - designated by the "0" in the array above.

You can change the paper tray priority order by changing the values in "/Priority [2 1 0]".
For example, /Priority [0 1 2] makes the 250 sheet cassette first priority, then the Multipurpose tray next, then the 500 sheet cassette.

3) Enable TraySwitching via LaserWriter Utility 7.4.1.

Note: Enabling this option through the Print dialog box will only affect the current job. Enabling TraySwitching via the LaserWriter Utility will save the selection for all jobs and will retain the setting even when the printer is powered off.

4) Use AutoSelect when printing.

With LaserWriter II engines, the manual feed slot for paper shares the same

paper pickup roller as the paper cassette. That is why the printer feeds from the cassette when there is no paper in the manual feed slot. The LaserWriter Pro 630 has a separate pickup roller for the multipurpose/manual feed tray.

Article Change History:
14 Apr 1997 - Added PostScript Level 2 code.
05 Aug 1993 - Added notes about non-volatile printer settings and about TraySwitching.

Macintosh QuickTime Movies on PCs (7/93)

Revised: 7/9/93
Security: Everyone

Macintosh QuickTime Movies on PCs (7/93)

==========

Article Created: 07 July 1993

TOPIC ----------

This article describes how to play Macintosh QuickTime movies on PCs running Windows.

DISCUSSION ----------

To make a movie playable on a PC, open it on the Macintosh using the Movie Converter utility (part of the QuickTime Starter Kit), and choose Save As from the File menu. In the dialog box that appears, click the checkbox "Playable on non-Apple computers" and "Make movie self-contained." You must name the file with no more than eight characters, plus the extension .MOV.

Opening MS-DOS documents using Macintosh PC Exchange (7/93)

Revised: 7/12/93
Security: Everyone

Opening MS-DOS documents using Macintosh PC Exchange (7/93)

==========

Article Created: 7 July 1993

TOPIC ----------

This article describes how to designate a specific Macintosh application for opening MS-DOS documents by the extension following its file name.

DISCUSSION ----------

Double-clicking an MS-DOS or Windows file like you would a Macintosh file at the Finder level usually doesn't result in the file opening. This is because the document doesn't know which Macintosh application to use. By using the PC Exchange control panel you can assign certain MS-DOS files to certain applications. This is done in the PC Exchange control panel window.

1) Open the PC Exchange control panel located in the Control Panel folder in your System Folder.

2) Click on Add.

3) Type in a period and the three letter extension, for example .TXT.

4) Select which Macintosh application is to be assigned that file type.

So that all members of a Network are consistent, make a master list of assignments on one Macintosh and place a copy of the PC Exchange Preferences folder in the Preferences folder of each licensed user of Macintosh PC Exchange.

Macintosh: How To Take A Snapshot Of Your Screen (5/95)

Revised: 5/25/95
Security: Everyone

Macintosh: How To Take A Snapshot Of Your Screen (5/95)

==========

Article Created: 7 July 1993
Article Reviewed/Updated: 25 May 1995

TOPIC ----------

This article describes a way of capturing a picture of what appears on your screen, including the menu bar, trash can and all open windows that are visible.

DISCUSSION ----------

To take a snapshot of the entire screen, simultaneously press Command-Shift-3 (Command is the open Apple key). You will hear a sound that sounds like a camera snapping a photo. Each screen shot is saved in the PICT file format. It will be created/saved automatically at the top (root) level of your hard drive directory and be labeled "Picture 1". If you keep taking screenshots, you will get "Picture 2", "Picture 3", and so on.

This PICT format document can be opened for viewing and printing. By double-clicking the file icon it will open into SimpleText or TeachText. It can also be opened by most graphics programs such as: ClarisWorks, MacPaint, Adobe Photoshop, Canvas, or many others. You can then use the Copy command to take information out of the shapshot and use the Paste command to place it in other documents or make changes to it.

Apple Ethernet Twisted Pair Transceiver (7/93)

Revised: 7/8/93
Security: Everyone

Apple Ethernet Twisted Pair Transceiver (7/93)

==========

Article Created: 7 July 1993

TOPIC ----------

I have a question concerning the Apple Ethernet Twisted Pair Transceiver. I was told that 10BaseT Ethernet only requires 4 conductors (2 twisted pair) which means it could be used with an RJ-11 connector. The Apple Ethernet Twisted Pair Transceiver ships with a cable that has 8 conductors (4 twisted pair) using an RJ-45 connector.

Why ship the cable with 4 extra conductors if they are not used? What are these extra conductors used for? Which colors are used and which are for other purposes in the cable sent from Apple?

DISCUSSION ----------

You are correct, 10BaseT 802.3 only requires 4 conductors. You could indeed wire up a 10BaseT Ethernet network using RJ-11 connectors. The other 4 conductors are not used.

The reason the Apple Ethernet Twisted Pair Transceiver uses an RJ-45 connector is because the 10BaseT addendum to the 802.3 standard specifies an RJ-45 connector. Here are the pin assignments:

Pin	Signal
1	TD+
2	TD-
3	RD+
4	Not used by 10BaseT
5	Not used by 10BaseT
6	RD-
7	Not used by 10BaseT
8	Not used by 10BaseT

Pinout for RJ-45 connector receptacle:

Serial Switch: Which Macintosh Models Need It (1/94)

Revised: 1/20/94
Security: Everyone

Serial Switch: Which Macintosh Models Need It (1/94)

==========

Article Created: 9 July 1993
Article Reviewed/Updated: 19 January 1994

TOPIC ----------

Why do the Macintosh Quadra 900 and 950 sometimes need Serial Switch installed, which keeps the serial ports from working too fast?

Do the newer Quadra, Centris and AV Series models need the Serial Switch as well? I cannot find a version written for these models.

DISCUSSION ----------

Only the Macintosh IIfx, the Quadra 900 and Quadra 950 need the Serial Switch.

The Macintosh Quadra 900 and 950 incorporated a design originally implemented in the Macintosh IIfx: an intelligent I/O processor (IOP) for controlling serial I/O. The IOP relieves the main processor of handling routine serial I/O tasks which allows the system to perform faster. (Similar IOPs offload ADB and floppy disk functions from the CPU.)

Unfortunately, some programs did not work when using the serial IOP, because they were written to require direct access to the serial controller chip. In order to obtain compatibility with these programs Serial Switch was developed. It places the serial IOP in a special "IOP Bypass" mode which allows programs to access the SCC directly, placing the burden of controlling serial I/O tasks on the CPU.

Other Macintosh Quadra and Centris models do not use IOPs. The CPU handles all serial I/O tasks, so no Serial Switch is required.

Article Change History:
19 January 1994 - specified which models might need the Serial Switch, and excluded other Quadra, Centris and AV models.

LaserWriter Pro Energy Star: Setting Engine Sleep Values 7/93

Revised: 7/9/93
Security: Everyone

LaserWriter Pro Energy Star: Setting Engine Sleep Values 7/93

==========

Article Created: 9 July 1993

TOPIC -----

I'm using the LaserWriter Pro Energy Star software that sets the LaserWriter Pros to sleep after a certain period of inactivity.

After downloading the PostScript commands, the PostScript log reads "Engine sleep timeout changed to x hours", where x is .5, 1, 2, or 4 hours.

What PostScript commands can I use to set/change or read the value of "Engine sleep timeout"?

DISCUSSION -----

The PostScript commands in the LaserWriter Pro Energy Star files are proprietary commands which we ourselves were unable to obtain from engineering. Thus, the sleep time files for setting the sleep timeout to .5, 1, 2, or 4 hours are the only ones available.

StyleWriter II: Banding w/Grayscale Images (7/93)

Revised: 7/9/93
Security: Everyone

StyleWriter II: Banding w/Grayscale Images (7/93)

==========

Article Created: 9 July 1993

TOPIC ----------

I'm using a StyleWriter II and an LC III. When printing GIFs, PICTs, TIFFs, and other graphics files, I get banding on any grayscale graphic.

Black and white graphics work fine, and the photos are coming out fine, (the grayscale part) but there will be a line of photo, then a white line, then a line of photo, and so on.

DISCUSSION ----------

We're not quite sure what you're seeing. We were not able to duplicate the problem with alternating lines of completely white, and then lines of photo. We printed various grayscale images in Adobe PhotoShop and got the "normal" banding. It seems that this is probably what the customer is seeing since you stated that black and white images print fine. If there was an actual problem, you would see white lines across a black image in black and white mode.

There will be a certain amount of "banding" with grayscale images as this is typical with inexpensive printers. Banding is a result of the physical properties of sprayed ink, as in the StyleWriter II. There should NOT, however, be any completely white lines (pixel size) all the way across an image. If this is the case, you might try selecting the option, "Clean Ink Cartridge before printing" or try a different cartridge altogether. If a new cartridge is used make sure you purge the cartridge. For more information on purging the cartridge reference article "StyleWriter II: Cleaning and Purging the Ink Cartridge."

LW 8.0 Driver: Compatibility w/Older Driver Versions 6/93

Revised: 7/9/93
Security: Everyone

LW 8.0 Driver: Compatibility w/Older Driver Versions 6/93

==========

Article Created: 9 July 1993

TOPIC ----------

Is the LaserWriter 8.0 driver compatible with older driver versions used on the same network? The LW 8.0 driver doesn't appear to reset printers initialized with, let's say the 7.2 drivers. Is this true, and how far back does compatibility exist?

DISCUSSION ----------

You are correct that LaserWriter driver 8.0 does not reset printers initialized with previous versions of the driver. Starting with LaserWriter driver 6.1, the Laser Prep dictionary is automatically downloaded with each print job to prevent re-initialization of the printer. Thus, as long as there are LaserWriter drivers 6.1 or greater (all the way to LaserWriter driver 8.0) in use on the network, there will be no Laser Prep "compatibility" problems and the printers will not reinitialize.

LW Pro: PostScript Commands to Utilize Tray Features (5/95)

Revised: 4/14/97
Security: Everyone

LW Pro: PostScript Commands to Utilize Tray Features (5/95)

==========

Article Created: 9 July 1993
Article Reviewed/Updated: 14 April 1997

TOPIC ----------

How can I utilize the paper tray features (of the LaserWriter Pro) from my UNIX workstation or my PC?

I am accustomed to accessing printer features using control panel buttons (as on an HP LaserJet) and want to know how to get those features on the LaserWriter Pro.

DISCUSSION ----------

A majority of printer functions can be use by sending PostScript code to the printer. The code included below is specific to the LaserWriter Pro.

For UNIX machines, insert "%!" at the very beginning of your PostScript file to designate it as such if you are using "lpr" to print the file.

Note: PostScript IS CASE SENSITIVE.

Here are segments of PostScript code which access most of the printer's features:

Caution:
=========
If you choose to use the PostScript code provided in this article, you assume all risks involved in making these changes. PostScript code, if not entered correctly, can place the LaserWriter into a condition requiring service.

==========

To enable the printer's STARTUP PAGE. To disable the startup page, use "false setdostartpage" instead of "true setdostartpage".

```
serverdict begin 0 exitserver
statusdict begin true setdostartpage end

==========================================================================
To send a FORM FEED to the printer.

showpage

==========================================================
To enable/disable TRAYSWITCHING:
Value x can be true or false.

serverdict begin 0 exitserver
<</TraySwitch x>> setpagedevice

==========================================================
To change the DEFAULT PAPER TRAY:

If you decide to use the PostScript code below, you need to be very careful in
selecting the default tray. If the multipurpose tray is set as the default and
there is no paper in it, the paper out LED will light for EVERY PRINT JOB until
paper is placed in the tray. This problem has caused some users (others on the
network) to think that the printer is malfunctioning and needs to be repaired.
Please forewarn users about this so they can understand, that the printer's
behavior has changed.

Begin_Table

Value x     Tray Selection
 _____      _______________
   0        250 Sheet Cassette
   1        Multi-purpose tray
   2        500 Sheet Cassette
   3        Envelope tray

End_Table

The integer value before "setdefaultpapertray" corresponds to the various
trays.

This is PostScript Level 1 code:

%==========================================================
% Begin PostScript Code
%
serverdict begin 0 exitserver
statusdict begin x setdefaultpapertray end
%
% End PostScript Code
%==========================================================

This is the equivalent PostScript Level 2 code:
```

```
%=========================================================
% Begin PostScript Code
%
serverdict begin 0 exitserver
1 dict dup /InputAttributes 1 dict dup /Priority [2 1 0] put put setpagedevice
%
% End PostScript Code
%=========================================================
```

This sets the paper tray priority to:
1st Priority - Cassette (500 Sheets) - designated by the "2" in the array above.
2nd Priority - Multipurpose Tray - designated by the "1" in the array above.
3rd Priority - Cassette (250 Sheets) - designated by the "0" in the array above.

You can change the paper tray priority order by changing the values in "/Priority [2 1 0]".
For example, /Priority [0 1 2] makes the 250 sheet cassette first priority, then the Multipurpose tray next, then the 500 sheet cassette.

==========

To change the PRINTER NAME:

```
serverdict begin 0 exitserver statusdict begin (newname) setprintername
```

==========

To print the CONFIGURATION PAGE:

```
/SamplePages/ProcSet findresource/TestPage get cvx exec
```

==========

To enable/disable FINEPRINT & PHOTOGRADE and change DPI (that is 300 to 600 dots per inch.) These changes will persist power cycles.

```
serverdict begin 0 exitserver

/imageoptions
   {
   systemdict/setpagedevice known  % Indicates a level two device
   {
   0 3 index 0 ne{1 add}if
   4 index 1 ne{1 add}if
   5 index 1 ne{1 add}if

   dup 0 gt
   { dup 1 add dict begin/Policies exch dict def
   2 index 0 eq

   {pop pop pop}
   {2 array astore exch pop
    /HWResolution exch def
    Policies/HWResolution 1 put}
```

```
        ifelse

   dup 1 ne
   {2 eq /PreRenderingEnhance exch def
    Policies/PreRenderingEnhance 1 put}
   {pop}
       ifelse

   dup 1 ne
   {2 eq/PostRenderingEnhance exch def
   Policies/PostRenderingEnhance 1 put}
   {pop}
        ifelse

   currentdict end setpagedevice
      }
   {pop pop pop pop pop pop}
      ifelse
   }
   {pop pop pop pop pop}
    ifelse

   } bind def
```

Here is the actual call to the above subroutines that enables/disables FINEPRINT and % PHOTOGRADE, and changes the DPI. The call values are set in the following order:

```
FP PG RF HR VR imageoptions
```

FP = FinePrint, values can be 1 (default, no change), 2 (on), 3 (off)
PG = PhotoGrade, values can be 1 (default, no change), 2 (on), 3 (off)
RF = Resolution Flag, values can be 0 (default, no change), 1 (use HR and VR values)
HR = Horizontal Resolution, values can be 300 or 600 (must match VR)
VR = Vertical Resolution, values can be 300 or 600 (must match HR)

For example, to set FinePrint ON, PhotoGrade OFF, and 300dpi, this is the call:

```
2  3  1  300  300  imageoptions
```

==========

To change the MULTIPURPOSE TRAY for LETTER size paper.

```
serverdict begin 0 exitserver <</InputAttributes
  << 1
    << /PageSize [612 792]
    >>
  >> >> setpagedevice
```

==========

To change the MULTIPURPOSE TRAY for LEGAL size paper.

```
serverdict begin 0 exitserver <</InputAttributes
  << 1
    << /PageSize [612 1008]
    >>
  >> >> setpagedevice
```

Article Change History:
14 Apr 1997 - Added PostScript level 2 code.
23 May 1995 - Added section to notify users about default paper tray change.
08 Feb 1995 - Added PostScript caution.

SNA•ps 3270 Manager, Users Guide, and v25bis Problem (7/93)

Revised: 7/9/93
Security: Everyone

SNA•ps 3270 Manager, Users Guide, and v25bis Problem (7/93)

==========

Article Created: 7 July 1993

TOPIC ----------

In setting up an SDLC connection using SNA•ps 3270 Manager, I selected "switched" and "v25bis". The phone number field will not accept any special characters (, ; w t) to control dialing. For example, when you move to a new field or try to save the config document you get the error, "invalid value; previous value substituted."

This is contradictory to the manual in Appendix G Configuring and Managing in a 3270 Environment under SDLC of the SNA•ps 3270 Users Guide. What's wrong, is it the manual or software?

DISCUSSION ----------

We tested SNA•ps 3270 Manager v2.0, and found the following:

- It is possible to configure for V25bis with the comma (,)
- Not with the Wait characters (W w :)
- Not with the Pause characters (K k <)
- Not with the Pulse characters (P p)
- Not with the Tone characters (T t)
- Not with the Flash Hook characters (& !)
- Not with the semicolon (;)
- Not with the Special Tone characters (A B C D * #)
- Most of the Presentation characters (- () and space) worked, but the dot (.) did not work.

However, all of these characters worked properly when the SNA•ps Config (version 2.0) was used instead of the SNA•ps 3270 Manager. SNA•ps Config would accept a "space" as a presentation character, but upon closing and reopening the configuration window, all characters behind the space were undisplayed - although they were still "there". (This was shown by an

attempt to reenter the "missing" characters and having the application 'beep' and then display the "missing" characters.)

As you mentioned SNA•ps 3270 Manager, we are assuming you don't have access to SNA•ps config. Even if you did have access to SNA•ps Config, the SNA•ps 3270 Manager can not open a configuration created by SNA•ps Config. SNA•ps Admin would be required to start a gateway configured by SNA•ps Config.

If you have version 2.0 of SNA•ps 3270, the comma (,) and common US presentation characters (- () and space) are functioning with that release. If you need additional characters, then yes SNA•ps 3270 Manager won't handle them.

Our sources tell us, "Anything but the most straight-forward set-ups really need to be done in SNA•ps Config and SNA•ps Admin. Yes, the SNA•ps 3270 Users Guide does not make it clear that 3270 Manager won't handle the complicated phone numbers."

A possible work-around would be to enter the phone number information in the modem itself. When DTR goes up the modem will dial the stored number. This would require a direct cable from the modem to the Macintosh, and an async terminal emulator (like MacTerminal) to set the modem configuration. It isn't hard, but it does require the modem's manual to be sure you get it right.

So, you either need SNA•ps Config and SNA•ps Admin (the Gateway product), or you need to configure the modem itself.

GS/OS 6.0.1: Shortcuts in Various Dialog Boxes (6/93)

Revised: 7/9/93
Security: Everyone

GS/OS 6.0.1: Shortcuts in Various Dialog Boxes (6/93)

==========

Article Created: 25 June 1993

TOPIC ----------

System 6 for the Apple IIGS often prompts you with dialog boxes. Dialog boxes are windows containing additional information, warnings, or instructions that ask you to provide additional commands to perform a certain function. This article presents a number of tips for working with the various dialog boxes.

DISCUSSION ----------

Directory Dialog Boxes (Standard File)

You can type one or more beginning letters of an item to select that item. You have to type a key every two-thirds of a second or faster to do this.

Pressing the Tab key no longer selects the next disk. In dialogs where you enter a file name, Tab chooses between the edit line and the file list. Keystrokes go to the one that's active.

Command-Right Arrow or Command-Tab moves to the next disk, and Command-Left Arrow moves to the previous disk.

Command-Period is the Cancel button (Esc isn't).

Esc and Command-Up Arrow are equivalent to the Close button (moving up one level).

Command-Esc, Command-D (for Disks), or Command-Shift-Up Arrow jump to the Disks level (like clicking Close repeatedly or clicking the Disks button).

Clicking on the path item (the triangle in a box, or the text next to it) displays a pop-up menu with one item for every level in the current path,

all the way up to Disks. Choosing an item takes you up one or more levels.

Command-O and Command-Down Arrow do the same thing as the Open button (not always the same as the bold-outlined button).

AlertWindow Dialog Boxes

AlertWindow handles many dialog boxes. There will be some text, one or more buttons, and usually an icon in the top left. In these dialogs:

- Esc and Command-Period do the same thing as the Cancel button, if one is available.
- Return is the bold-outlined button, if there is one.
- For other buttons, you can type the first letter of a button name to go to that button. If two buttons have the same first letter, typing that letter does nothing. This feature works with or without the Command key.

Font Selection Dialog Box

This dialog is the one that appears in Teach when you Choose Font... from the Font menu. Note that the same dialog appears in many other applications, sometimes in response to a menu item with a different name, like Attributes...

Use Tab (or the mouse) to move between the font family list, the size list, and the size box. In the family list, you can use arrows and letters to choose a family. In the size list, you can use the up and down arrows (typing a letter takes you back to the family list automatically).

Command -P, -B, -I, -U, -O, and -S toggle the six Style checkboxes (Plain, Bold, Italic, Underline, Outline, Shadow).

Tabbing Between Controls

Tab advances to the next targetable control. In many dialogs, Command-Tab moves in the opposite direction, to the previous targetable control.

Checkboxes and Radio Buttons

You can almost always toggle a checkbox or select a radio button by clicking in the description beside it. You don't have to click inside the square or circle.

GS/OS 6.0.1: Finder Shortcuts (6/93)

Revised: 7/9/93
Security: Everyone

GS/OS 6.0.1: Finder Shortcuts (6/93)

==========

Article Created: 25 June 1993

TOPIC

This article describes the Finder shortcuts you can use when you have GS/OS 6.0.1 installed on your Apple IIGS computer. Also, look under Finder Help for a list of many Finder shortcuts.

DISCUSSION

Icons

Use the arrow keys to move from one icon to another, or use Keyboard navigation commands for selecting icons easily. Here are Keyboard navigation commands and other icon commands:

- Press the Tab key to select the next icon alphabetically.
- Press Shift-Tab to select the previous icon alphabetically.
- Press the Esc key to deselect all icons on the desktop and move the keyboard-select keys to the icons in the front window.
- Press Command-Esc or Command-Shift-Up Arrow to deselect all icons in the front window and move the keyboard-select keys back to the desktop.
- The File menu Put Away command (Command-Y) now works on disk icons as well as files and folders. Putting away a disk ejects the selected disk, or disconnects the selected shared disk. Dragging a disk icon to the trash does the same thing.
- The Finder automatically selects a disk's icon when you insert the disk. Also, when you close a window, the Finder automatically selects the disk or folder icon where the window closed, unless you selected other icons.

The Finder assumes that if you selected icons in another window or on the desktop, it should leave them selected.

- You can double-click on a control panel icon to open that control panel, even if it isn't in your startup disk's System:CDevs folder.

  Note: You must keep control panels that do special things at system startup time in the System:CDevs folder.

- You can drag a control panel icon onto the desktop for convenience. If you drag it from the System:CDevs folder, the system still sees the control panel as though it's stored in the CDevs folder.

Windows

These are keyboard commands for window manipulations:

- Press Command-Keypad-0 to cycle through open windows. Command-Shift-Keypad-0 cycles through the windows the other way.

- Control works with Command-W and Command-Option-W to temporarily reverse the Save Finder information setting.

- Use Command-Period to stop the calculate in Icon Info windows.

- When an Icon Info window is in front and the General card is visible, typing I toggles the Inactive checkbox (if present) and L toggles the Locked checkbox. You can inactivate several kinds of files, including Finder Icon files that you don't want to use. You can also use Command-K to activate the calculate icon.

- Command-1 through Command-4 select various Icon Info cards, left to right. Not all cards are present for all icons. The four cards are: General, Where, Comment, and Access.

- Command-W always closes the front System window (NDAs and Control Panels, for example), even if the application you're in doesn't support the standard Command-W equivalent for Close in the File menu.

- If you already have NDA windows open, you can bring them in front of some dialog boxes (for example, Finder Preferences, and EasyMount Connect As), just by clicking in the NDA window.

Documents

Holding down the Option key while double-clicking a document (or while choosing Open from the Finder's File menu) presents the directory dialog box. You can specify what application to associate with the desired document for a one-time launch. Holding down Option-Control while double-clicking a document does the same thing, but the Finder makes a note to launch that application whenever you open a document of that same kind.

Folders

You can hold down the Option key and choose Control Panels from the Apple menu to open the System:CDevs folder.

You can also drag folders onto the desktop. This wasn't allowed in previous versions of the Finder.

Dialogs

In the Shut Down dialog, you can type S, R, or Q to select the Shut Down, Restart, or Quit radio buttons, and you can use the Up and Down arrow keys to select different buttons.

In the Preferences dialog, 1, 2, 3, and 4 toggle the four checkboxes grouped under List Views, and S, H, W, and C toggle the other four items, which begin with those letters. These work with or without the Command key.

Keyboard Navigation in Lists

Whenever you see a List control with a bold frame, you can use the Up and Down arrows to select various items in the list. You can also type the first one or more letters of an item to select it. When typing the first several letters of an item, you have to type a key every two-thirds of a second or faster. You can also press the Clear or Delete key to clear the existing string of letters instead of waiting two-thirds of a second. Some lists without bold frames work this way too.

Working with Disks

When initializing or erasing a disk (in the Initialize dialog), Command-Return works for the Initialize or Erase button.

When you insert a formatted disk, but not for a file system you can use, you get an alert that identifies the disk's format as best it can and asks "Do you want to initialize it? Eject/Initialize." If you hold down the Option key when you click Initialize, the system offers to erase the disk instead.

Note: Erasing saves time, since it won't physically reformat the media. On the other hand, the system doesn't verify that all blocks on the disk are usable. Use Erase instead of Initialize only if you're sure the disk is properly formatted.

Command-Period now works like Esc to terminate Verify or Validate.

EasyMount

If the EasyMount Finder extension is installed, then "Make Alias..." appears in the Extras menu. Select any disk, folder, or application icon and choose "Make Alias..." from the Extras menu. EasyMount will ask you where to save the EasyMount document.

You can double-click on an EasyMount document to open the original item. That is, double-clicking on an EasyMount document opens a disk window, opens

a folder window, or launches an application.

If the original item is a shared disk, or is on a shared disk, EasyMount automatically connects to the shared disk before opening the item. A "Connect as" dialog will appear if a password is required but not recorded.

If the password is recorded, but you want the "Connect as" dialog anyway, hold down the Option key while double-clicking the alias. You can change the Guest/Registered User setting or enter a different user name. In the "Connect as" dialog, Command-G and Command-R select the Guest and Registered User radio buttons.

To skip opening a disk or folder window, hold down the Control key while double-clicking the EasyMount document.

GS/OS 6.0.1: System Startup Options (6/93)

Revised: 7/9/93
Security: Everyone

GS/OS 6.0.1: System Startup Options (6/93)

==========

Article Created: 25 June 1993

TOPIC ----------

This article describes how to invoke three options you have when you start your Apple IIGS computer with GS/OS 6.0.1 installed:

- Starting up in ProDOS 8
- Starting up without loading INITs
- Starting up to bypass the Startup application

DISCUSSION ----------

Starting Up In ProDOS 8

When turning on the computer or rebooting, press the 8 key to start up in ProDOS 8.

Bypassing INITs

When turning on the computer or rebooting, hold down the Shift key to inhibit loading of non-system INITS (in the System.Setup folder) and all desk accessories (in the Desk.Accs folder). This can be useful if you've recently added an INIT or DA that prevents the system from booting normally. You can use the Shift key to boot without loading the offending file, and then remove the file once the system displays the Finder.

Bypassing the Startup Application

If you normally have a Startup application selected (with the SetStart control panel), you can temporarily override this setting by holding down the Command key during the startup process. When the SetStart icon appears (the boot), the Control Panel will recognize the keypress, skip setting the Startup application, and then draw a red X through the icon. At this point,

you can release the Command key. The system will start the Finder instead of the selected startup application.

GS/OS 6.0.1: Text Editing Shortcuts (6/93)

Revised: 7/9/93
Security: Everyone

GS/OS 6.0.1: Text Editing Shortcuts (6/93)

==========

Article Created: 25 June 1993

TOPIC ----------

When editing text (for example, in the Teach application, or in the Comment card of an Icon Info window in the Finder), try these shortcuts.

DISCUSSION ----------

Navigating and Selecting Text

Add the Shift key to this group of key combinations to select the intervening text:

- Command-Left Arrow moves left a word at a time.
- Command-Right Arrow moves right a word at a time.

- Option-Left Arrow moves to the beginning of the line.
- Option-Right Arrow moves to the end of the line.

- Command-Up Arrow moves to the top of the page.
- Command-Down Arrow moves to the bottom of the page.

- Option-Up Arrow moves to the beginning of the document.
- Option-Down Arrow moves to the end of the document.

Clicking the mouse moves the insertion point; dragging selects by character. Double-clicking selects a word; dragging extends the selection by words. Triple-clicking selects a line; dragging extends the selection by lines.

Deleting Text

Delete (or Control-D) removes the current selection. If there's no selection, it removes the character to the left of the insertion point.

Clear removes the current selection.

Control-F removes the character to the right of the insertion point. If there's a selected portion of text, it removes the selection.

Control-Y removes all characters from the insertion point to the end of the line.

Control-X, -C, and -V are Cut, Copy, and Paste. You can use these even in unusual cases where the Edit menu isn't available.

Keyboard Translation

If you choose Standard in the General Control Panel's Translation menu, you can type special characters by holding down the Option key.

Most of the special characters are easily viewable if you have Video Keyboard installed (use the Installer script Special Aids: VideoKeyboard). Choose Video Keyboard from the Apple menu, and then hold down Option, or Option and Shift.

Certain characters begin two-character sequences: Option-e puts an accent over the next letter, Option-` puts an (`) accent over the next character, Option-i puts a caret (^) over the next character, and Option-n puts a tilde (~) over the next character.

GS/OS 6.0.1: Archiver and Easy Access Shortcuts (6/93)

Revised: 7/9/93
Security: Everyone

GS/OS 6.0.1: Archiver and Easy Access Shortcuts (6/93)

==========

Article Created: 28 June 1993

TOPIC ----------

This article gives hints for working in the Archiver and Easy Access programs.

DISCUSSION ----------

ARCHIVER

- Use "?" for the Identify button.
- Use the Right Arrow key for the Device button.
- Use Command-M for Mark files, and Command-U for Unmark files.

EASY ACCESS

Controlling the Mouse From the Keyboard

On the 1 Megabyte Apple IIGS (ROM 3), and on ROM 1 computers when Special Aids: Easy Access is installed, you can control the mouse from the keypad. Press Command-Shift-Clear to enable keyboard mouse control; press Clear to disable it.

While keyboard mouse control is on, keys on the numeric keypad control the mouse pointer. The 5 key is the mouse button, and the keys surrounding it (1-4 and 6-9) allow horizontal, vertical, and diagonal movement.

To make each press of a direction key move the pointer in larger increments, type * followed by a digit from 1 to 9 (*1 or ** returns to normal).

Press the 0 (zero) key to lock down the mouse button until you press the Period key.

Sticky Keys

On the 1 Megabyte Apple IIGS (ROM 3), and on ROM 1 computers when Special Aids: Easy Access is installed, you can use Sticky Keys to press modifier keys in sequence instead of all at once. The modifier keys are Shift, Command, Option, and Control.

To turn Sticky Keys on or off, press and release Shift five times in a row. When Sticky Keys is on, every modifier key you press and release is considered pressed for the next non-modifier key press. To lock down a modifier for a series of key presses, press and release the modifier twice in a row. (To turn off a locked modifier, press it three times in a row.)

Sticky Keys automatically turns off if you press a modifier and non-modifier key at the same time.

Easy Access requires an ADB keyboard and therefore doesn't work on a converted Apple IIe.

GS/OS 6.0.1: Shortcuts to Use with Control Panels (6/93)

Revised: 7/9/93
Security: Everyone

GS/OS 6.0.1: Shortcuts to Use with Control Panels (6/93)

==========

Article Created: 28 June 1993

TOPIC ----------

This article discusses shortcuts you can use in control panels when you have GS/OS 6.0.1 installed on your Apple IIGS.

DISCUSSION ----------

The Control Panels Window

Command-Shift-Esc opens the Control Panels window, just like choosing Control Panels from the Apple menu. Command-Option-Shift-Esc opens the System:CDevs folder, if you're in the Finder.

You can use letters and arrow keys to select a control panel icon.

The Return key, Command-O, or double-clicking an icon opens the selected Control Panel(s).

If you hold down the Option key while opening a Control Panel, the main window closes after the Control Panel opens. This is similar to holding the Option key while opening a folder in the Finder.

You can hold down the Command key and click on an icon to select several control panel icons at once, or you can hold down the Shift key to select a whole range of control panel icons.

Command-H or Command-? is the Help button.

AppleShare Control Panel

Use the Tab key to move between the Zone list, Server list, and User Name. If you have a lot of zones or a lot of servers, arrow keys and letter keys

are helpful.

In the "Connect to the file server...as" dialog, Command-G and Command-R select the Guest and Registered User radio buttons.

Sounds Control Panel

The Sounds Control Panel lets you choose what sounds, if any, the computer plays for the System Beep and twenty-two specific events (such as Disk Inserted, Disk Ejected, and Task Completed).

Choose an event from the Event menu, and then choose a sound from the Sounds menu. The Sounds menu contains Not Assigned, Silence, and Standard Beep, plus the sounds in your System:Sounds folder. These sounds are in the same format HyperCard IIGS uses (if you put a HyperCard IIGS stack in the Sounds folder, any sounds in the stack are available). If no sounds are listed, install Control Panel:Sounds using the Installer, to get eleven sounds.

Setting an event to Not Assigned gives any other sound utilities you installed a chance to respond to that event. If no sound utility responds to the event, the result is either silence or the Standard Beep (it depends on the program causing the event, not the event itself).

Pressing Return with the Sounds window in front replays the currently selected sound.

Time Control Panel

Use the Tab key to move between Date and Time controls. Left and right arrows move between fields. The Up and Down arrows change field values.

You can type numbers directly -- there's no need to adjust them with the mouse.

GS/OS 6.0.1: Shortcuts to Use with Desk Accessories (6/93)

Revised: 7/9/93
Security: Everyone

GS/OS 6.0.1: Shortcuts to Use with Desk Accessories (6/93)

==========

Article Created: 28 June 1993

TOPIC ----------

This article tells you the shortcuts available to use in Desk Accessories when you have GS/OS 6.0.1 installed on your Apple IIGS computer.

DISCUSSION ----------

CLASSIC DESK ACCESSORY MENU (COMMAND-CTRL-ESC)

You can type the first letter of each desk accessory name to move around in the built-in or "classic" desk accessory menu. Each press selects the next line that starts with that letter.

The Esc key takes you to Quit. Command-Up Arrow and Command-Down Arrow take you up and down one screen at a time.

DESKTOP DAS

Calculator Desk Accessory

The Calculator window layout matches the keypad. You can use the main keyboard, the keypad, or click on the buttons in the Calculator window interchangeably.

Every time you use = the Calculator repeats the last operation. For example, to count backwards from 98 by sevens, type "98 - 7 = = = = = = = =".

Typing / followed by = computes the reciprocal (as on many algebraic calculators). For example, 4 / = gives 0.25.

Press H to toggle between decimal and hexadecimal mode. Press Z (or click

the Zoom box) to zoom the window to show or hide the A-F keys. (The keys don't have to be visible to use Hex. "Hex" appears in the display when you're in Hex mode.

Click on the small Apple symbol (or Command-?) to show the About box.

Copy (or Command-C) copies the Calculator display to the Clipboard as text.

Cut (or Command-X) copies the Calculator display to the Clipboard as text, and clears the display to zero.

Paste (or Command-V) lets you paste numbers or calculations from the Clipboard into the Calculator, just as if you were typing the characters on the keyboard. Characters the Calculator doesn't recognize are simply ignored.

Find File Desk Accessory

Find File normally ignores invisible files. If you want to include invisible files in the search, hold down the Option key when you click on the Find File button (or when you press the Return key to begin the search).

You may continue working while Find File searches, but it searches faster while the Find File window is in front. (The system responds to mouse clicks in about one second while Find File is searching.) Press Esc or Command-Period to stop the search.

Command-F opens Find File unless the application is already using that key for a menu item.

GS/OS 6.0.1: How It Differs from 6.0 (6/93)

Revised: 7/9/93
Security: Everyone

GS/OS 6.0.1: How It Differs from 6.0 (6/93)

==========

Article Created: 28 June 1993

TOPIC ----------

This is a summary of the visible changes in GS/OS 6.0.1 compared to 6.0. There have been many bugs fixed and many features added that aren't immediately visible. This document helps identify those features or changes.

DISCUSSION ----------

FINDER (SEE ALSO FINDER HELP)

You can now click in Name, Size, Kind, or Last Modified at the top of a list-view window to change the view.

To rename an icon, you must now click on its name rather than the icon.

The File Copy Alternatives dialog has been removed. Holding down the Option key now always forces a copy rather than a move.

Dragging certain system-related files to the System folder icon on the boot volume now does "magic routing" much like the Macintosh Finder. Note that this only works when using the folder icon; dragging into a window works as before. The kinds of files that are properly placed in their own folders within the System folder are: Control Panels, Desk Accessories, Drivers, FSTs, Tools, Fonts, Sounds, INITs, and Finder Extensions. Other files are just placed in the System folder.

The Finder now creates the FinderExtras folder for you.

If you open the Icon Info window on an Apple SCSI device, the SCSI ID number appears on the Where card.

The Finder's Clipboard window handles text, pictures, and sounds. If you copy a sound to the Clipboard (using the Sound control panel, for example), you can click on the Speaker icon on the Clipboard to hear the sound. Teach has the same Clipboard window.

EXTENSIONS

EasyMount isn't just for servers anymore. It now handles aliases to any disk, folder, or application. In other words, you don't need to drag the icon onto the desktop anymore -- just keep an alias of it on the desktop. Select the icon of the item you want to alias and choose "Make Alias…" from the Extras menu. EasyMount will ask you where to save the alias. Later, double-clicking the alias opens the real item, disks and folders are opened, and applications (ProDOS 8 or GS/OS) are launched. The Installer automatically installs EasyMount in your System.Setup folder.

CONTROL PANELS

DC Printer Control Panel

This was a change in System 6.0 but not documented: The DC Printer will let you choose LaserWriter, which is potentially useful for "printing" to PostScript files.

Monitor Control Panel

The new checkbox "Smoother Mouse Cursor" sets a new Battery RAM location. It kills the cursor flicker that's especially noticeable with a Video Overlay card or an accelerator.

SetStart Control Panel

The new checkbox "Show icons during startup" provides a way to set the Battery RAM location that disables the display of the startup icons. The Battery RAM location has been there since System 6.0, but there was no Apple-provided way to change it.

The new checkbox "Enable programmer CDAs" provides a way to set the Battery RAM location that allows Visit Monitor and Memory Peeker to show up in the CDA menu. Both ROM 1 and ROM 3 Apple IIGS computers now check this location. This checkbox doesn't show up if the ROM 3 Control Panel disable jumper is present.

STARTUP

During startup, if you have a lot of icons, they no longer keep recycling the bottom row of the screen. They now "wrap up" to the row above.

If you use a Vulcan internal hard drive, you no longer need to copy the Vulcan driver onto the Install disk when installing new system software. You can still use the Vulcan driver for enhanced performance, but you can successfully install without it.

If your ROM 3 Apple IIGS has 8 Megabytes of RAM, the computer fails to create a RAM disk (RAM5) of any size. In this case, System 6.0.1 creates RAM5 and then restarts the system. When you turn on the computer, you will hear an extra beep at the "Apple IIGS ... ROM Version 3" screen.

DRIVERS

The RAM5 RAM disk has a new driver. The Installer automatically installs it if you have the RAM disk enabled when you do an Easy Update. The driver greatly enhances the disk's performance. It also allows you to have a RAM5 disk in GS/OS (but not in ProDOS 8) even when slot 5 is switched to "Your card." On a ROM 1, you must have the Minimum and Maximum sizes set to the same value; otherwise you'll see a message during startup and it won't use the new driver.

The Apple II Memory Expansion Card has a new optional format. If you have a full megabyte of memory on the card, it lets you format it as either 1,024K or 800K. The 800K option blocks out the remaining 224K, but allows faster block copies to and from other 800K disks.

FILE SYSTEM TRANSLATORS (FSTs)

The MS-DOS FST is new. To use it, you need a drive that can read MFM disks, such as the Apple SuperDrive with an Apple II SuperDrive Controller Card.

This version is read-only -- it doesn't let you make changes to MS-DOS disks.

PRODOS 8

The Thunderclock year table in ProDOS 8 has been updated for the years 1993-1998. There's also a Clock.Patch file on the SystemTools2 disk that you may use to update ProDOS 8 (renamed to ProDOS) to include future year groups.

Performa 450: Optional Math Co-processor (4/95)

Revised: 4/25/95
Security: Everyone

Performa 450: Optional Math Co-processor (4/95)

==========

Article Created: 7 July 1993
Article Reviewed/Updated: 25 April 1995

TOPIC -----

Is there an optional FPU (floating-point unit) for the Performa 450 computer?

DISCUSSION -----

The Performa 450 computer can be upgraded with a math co-processor by installing a standard Motorola 68882 chip rated at 25 MHz (or better). The hardware and software will automatically recognize the chip. No further hardware or software changes are required.

A Motorola MC68882 FPU is usable in the Performa 450 though it is no longer available from Apple at the retail level but is available as a service part.

Article Change History:
25 Apr 1995 - Noted that retail part no longer available from Apple.

System 7.0.x AppleShare Client and System 6.0.x: Incompatible

Revised: 7/9/93
Security: Everyone

System 7.0.x AppleShare Client and System 6.0.x: Incompatible

==========

Article Created: 6 July 1993

TOPIC --

I'm trying to make a bootable 800K floppy disk for my Macintosh Plus that has system 6.0.x and AppleShare client software on it so I can mount my file server. AppleShare appears to be working fine until I get to the point of selecting the volume I want to mount. I get a message about the desktop file on the volume needing repair. When I click on OK to repair it, I get into a loop with the dialog box saying the desktop file couldn't be created and then there's nothing I can do but reboot. What's going on?

DISCUSSION --

This problem stems from the incompatibility of the System 7.0.x version of the AppleShare client software with System 6.0.x. The System 7.0 and System 7.0.1 AppleShare client extension is compatible with System 7.0 and System 7.0.1 only.

With System 6.0.x, you can use the version of AppleShare that comes on the AppleShare 3.0.x Workstation Installer disk, or the System 7.1 version of AppleShare. We recommend using the Installers to install the AppleShare client software on System 6.0.x.

You can also use the Installer from System 6.0.x to install the System 6.0.x version of AppleShare workstation software.

System 7.x.x: Corrupt Fonts Constrict the System Heap (4/94)

Revised: 4/22/94
Security: Everyone

System 7.x.x: Corrupt Fonts Constrict the System Heap (4/94)

==========

Article Created: 8 July 1993

TOPIC --

Sometimes launching an application causes the System Software size in "About this Macintosh" to increase anywhere from 250K to 2MB or more, depending on the application. After quitting the application, the System Software memory size doesn't return to its previous, smaller size. The problem could be corruption of the System Heap caused by either an extension, control panel, or a corrupt font suitcase. This article tells you how to troubleshoot this situation.

DISCUSSION ---

Follow these steps to resolve this problem:

1) Make sure the application is compatible with System 7.x.x.
2) Check that it isn't an extension conflict by starting the Macintosh with extensions off and testing the application.
3) If the system doesn't return the memory, test for a corrupt font suitcase:
   a) Drag the Font folder from the System Folder to the Desktop.
   b) Restart the Macintosh.
      This creates a new, empty Fonts folder in the System Folder.
   c) Test the application.
4) If the problem goes away, find the troublesome font by reinstalling each font suitcase one at a time, restarting, and testing.
5) Otherwise, do a clean install of your System Software.

Saved PostScript File: Can't Generate Original Document (7/93)

Revised: 7/9/93
Security: Everyone

Saved PostScript File: Can't Generate Original Document (7/93)

==========

Article Created: 8 July 1993

TOPIC ----------

I saved a print task to a PostScript file, and now I can't print that document in anything other than code. How can I retrieve the file in its original format. The file originated in FileMaker Pro and was saved in PostScript to be placed in a Word document.

DISCUSSION ----------

Once a file is printed to a PostScript file, there's no way to reverse the process and generate the original document. Basically, the PostScript file consists of instructions that just image a page, and doesn't contain any information such as file format or data structures that defined the file.

But you should be able to print the document represented by the PostScript file. Standard PostScript files are in a standard ASCII text format. You can use the LaserWriter Utility to download PostScript files to the LaserWriter.

If the file was saved as an EPS (Encapsulated PostScript) file, then any program that reads EPS files can import the image into a document. Bear in mind that an EPS file doesn't contain modifiable elements. Some programs such as Aldus PageMaker allow you to place the EPS file on a page, crop it, move it, but not modify it.

LaserWriters: With No Straight Manual Feed (7/93)

Revised: 7/12/93
Security: Everyone

LaserWriters: With No Straight Manual Feed (7/93)

==========

Article Created: 9 July 1993

Article Change History

07/12/93 - REVISED
• Added the word "family" to the second paragraph in the Discussion

TOPIC ----------

Is it possible to do a straight through manual feed on a LaserWriter Pro?

DISCUSSION ----------

No. There is no possible way to do a straight through manual feed on the LaserWriter Pro. The straight through paper path was changed to an "S" shape paper path with the LaserWriter Select, the Personal LaserWriter and the LaserWriter Pro series.

The original LaserWriter, the LaserWriter Plus and the LaserWriter II family are the ONLY Apple laser printers that have a straight through paper path.

Serial NB Card: Resistor Pack Configuration (7/93)

Revised: 7/12/93
Security: Everyone

Serial NB Card: Resistor Pack Configuration (7/93)

==========

Article Created: 9 July 1993

TOPIC ----------

- I have a Serial NB Card and I've have gotten the impression that the resistor packs (R-paks) are specific to the cable being used. The information that I have states or implies that there is only one type of R-pak and that their use is only if you have and want to use more than two of the connectors on the Hydra, RS-232-C cable.

- The numbers on the R-pak had v.35 and 8950 on the chips with the Apple logo on it. How can I get the R-pak for the RS-232-C. Is there such a thing?

DISCUSSION ----------

The Apple Serial NB Card manual in Chapter 3 (p 23 and 24), spells out what resistor pack configurations and cabling you should use for the Apple Serial NB Card. Remember there are two types of cables, the Hydra cable with four RS-232-C connectors, and the V.35 cable with one RS-232-C connector and one V.35 connector.

The R-paks that ship on the card are removed ONLY when you are using ports 1A or 1B on the Hydra cable. There are no specialized RS-232-C, R-paks. If you use ports 2A or 2B on the Hydra cable leave the R-paks in place. You also leave the R-paks in place when using either connector of the V.35 cable.

Here is some details on configuring the serial card R-paks for products that use the Apple Serial NB card, such as MacX25 and SNA•ps:

MacX25

You must configure MacX25 to use port 1A of either the Hydra cable or V.35 cable. When using the Hydra cable, remove the R-paks.

SNA•ps

Any of the Hydra cable ports or V.35 cable ports may be used. The same R-pak "rule" applies, if ports 1A and/or 1B of the Hydra cable are used the R-paks must be removed.

Express Modem: Fax Driver Unable to Display EPS Image (7/93)

==========

Article Created: 12 July 1993

TOPIC ----------

I'm importing an EPS (Encapsulated PostScript) graphic into Word Perfect (v.2.1.1.) using a Duo 230, and an Express Modem. When I attempt to send it (fax), the graphic does not show up. The rest of the document shows up, but the graphic never makes it.

DISCUSSION ----------

To verify the problem, I created an EPS file, opened a PICT in Photoshop and did a "Save As" using the EPS file type. After clicking on the "Save" button I was presented with another dialog box which had an option for specifying a PICT preview. I specified "None" and pasted the EPS file into my word processor. No graphic was displayed on the screen or in a fax created by that document. However, if I selected a PICT preview both the screen and fax versions of the document displayed the graphic.

The fax driver only uses QuickDraw, the same way the video display does, so it's unable to display an EPS image unless the PICT preview is included. If the same document were to be printed to a non-PostScript device (StyleWriter, LaserWriter LS, and so on) that the same thing would happen. In other words, no PICT preview, no graphic.

Serial NB Card: RS-232 (Multi-headed cable) Pinouts (7/93)

Revised: 6/23/94
Security: Everyone

Serial NB Card: RS-232 (Multi-headed cable) Pinouts (7/93)

==========

Article Created: 12 July 1993
Article Reviewed/Updated: 23 June 1994

TOPIC ----------

I would like to manufacture my own RS-232 (multi-headed Hydra cable) for the Serial NB card and the V.35 cable. Do you have the pinouts?

DISCUSSION ----------

Apple's RS-232 cable (M0128LL/A) and the V.35 cable (M0145LL/A) have been manufactured to meet our shielding requirements.

Making your own custom RS-232 cable may work, but because of the shielding requirements, Apple cannot recommend the use of custom cables as signal loss may occur.

The V.35 cable contains components in addition to the cable. The information for this cable is considered proprietary information.

Here are the pinouts for the RS-232 (multi-headed) cable for the Serial NB card. This information is provided for its technical content only and the use of this information to make custom cables is not recommended.

Serial NB RS-232C 4 head cable has one 62 pin D connector labeled P1 connected to four 25 pin D connectors labeled P2 through P5.

Apple Workgroup Server 95: Delay In File Management (6/93)

Revised: 7/12/93
Security: Everyone

Apple Workgroup Server 95: Delay In File Management (6/93)

==========

Article Created: 11 June 1993

TOPIC -----

Is there a significant delay in basic file management when renaming an existing folder, moving folders into another folder, or opening folders? It is not acceptable to wait more than a few seconds for a window to display the contents of a folder with approximately 20 files.

DISCUSSION -----

No, improvement is seen over the current use of NFS shared services.

The performance with about 20 files in a folder is about 1-2 seconds to open the folder. This performance can also depend on the CPU being used as the client workstation.

Revised: 7/12/93
Security: Everyone

AppleShare Pro: Application Incompatibilities (6/93)

==========

Article Created: 11 June 1993

TOPIC ----------

Are there any incompatibilities between AppleShare Pro on an Apple Workgroup Server (AWS) 95 and the following applications:

- ACIUS' 4th Dimension
- Adobe's PhotoShop
- Aldus' FreeHand
- Aldus' PageMaker
- Apple's MacX
- Claris' CAD
- Claris' FileMaker
- Claris' HyperCard
- Claris' MacDraw
- Claris' MacDraw Pro
- Claris' MacProject Pro
- FormZ
- MacroMedia's ModelShop II
- Microsoft's Excel
- Microsoft's Word
- SuperPaint

DISCUSSION ----------

Based on the fact that the server is not supposed to be used as a workstation, the client system won't see any differences than using any other AFP server. If the question is based on launching applications that reside on the server, then the facilities for copy protection and limited number of launches are implemented.

Apple 500MB & 1GB Hard Drives: SCSI Pin Configuration (7/95)

Revised: 7/31/95
Security: Everyone

Apple 500MB & 1GB Hard Drives: SCSI Pin Configuration (7/95)

==========

Article Created: 12 July 1993
Article/Revised/Updated: 31 July 1995

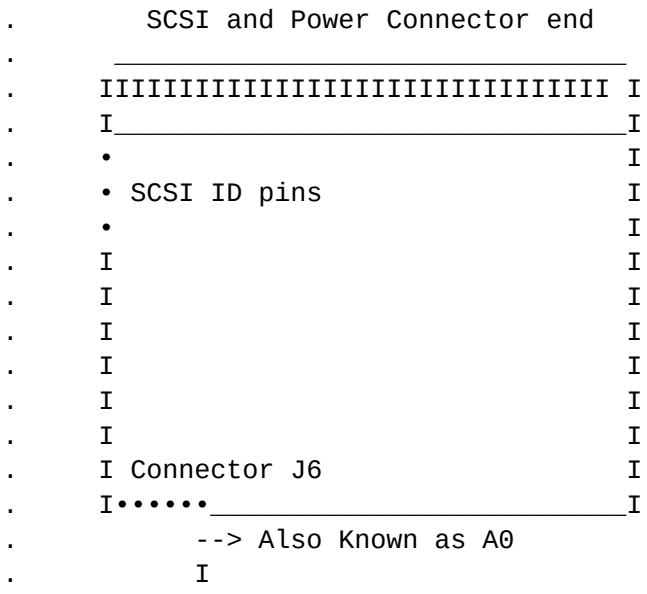
TOPIC ----------

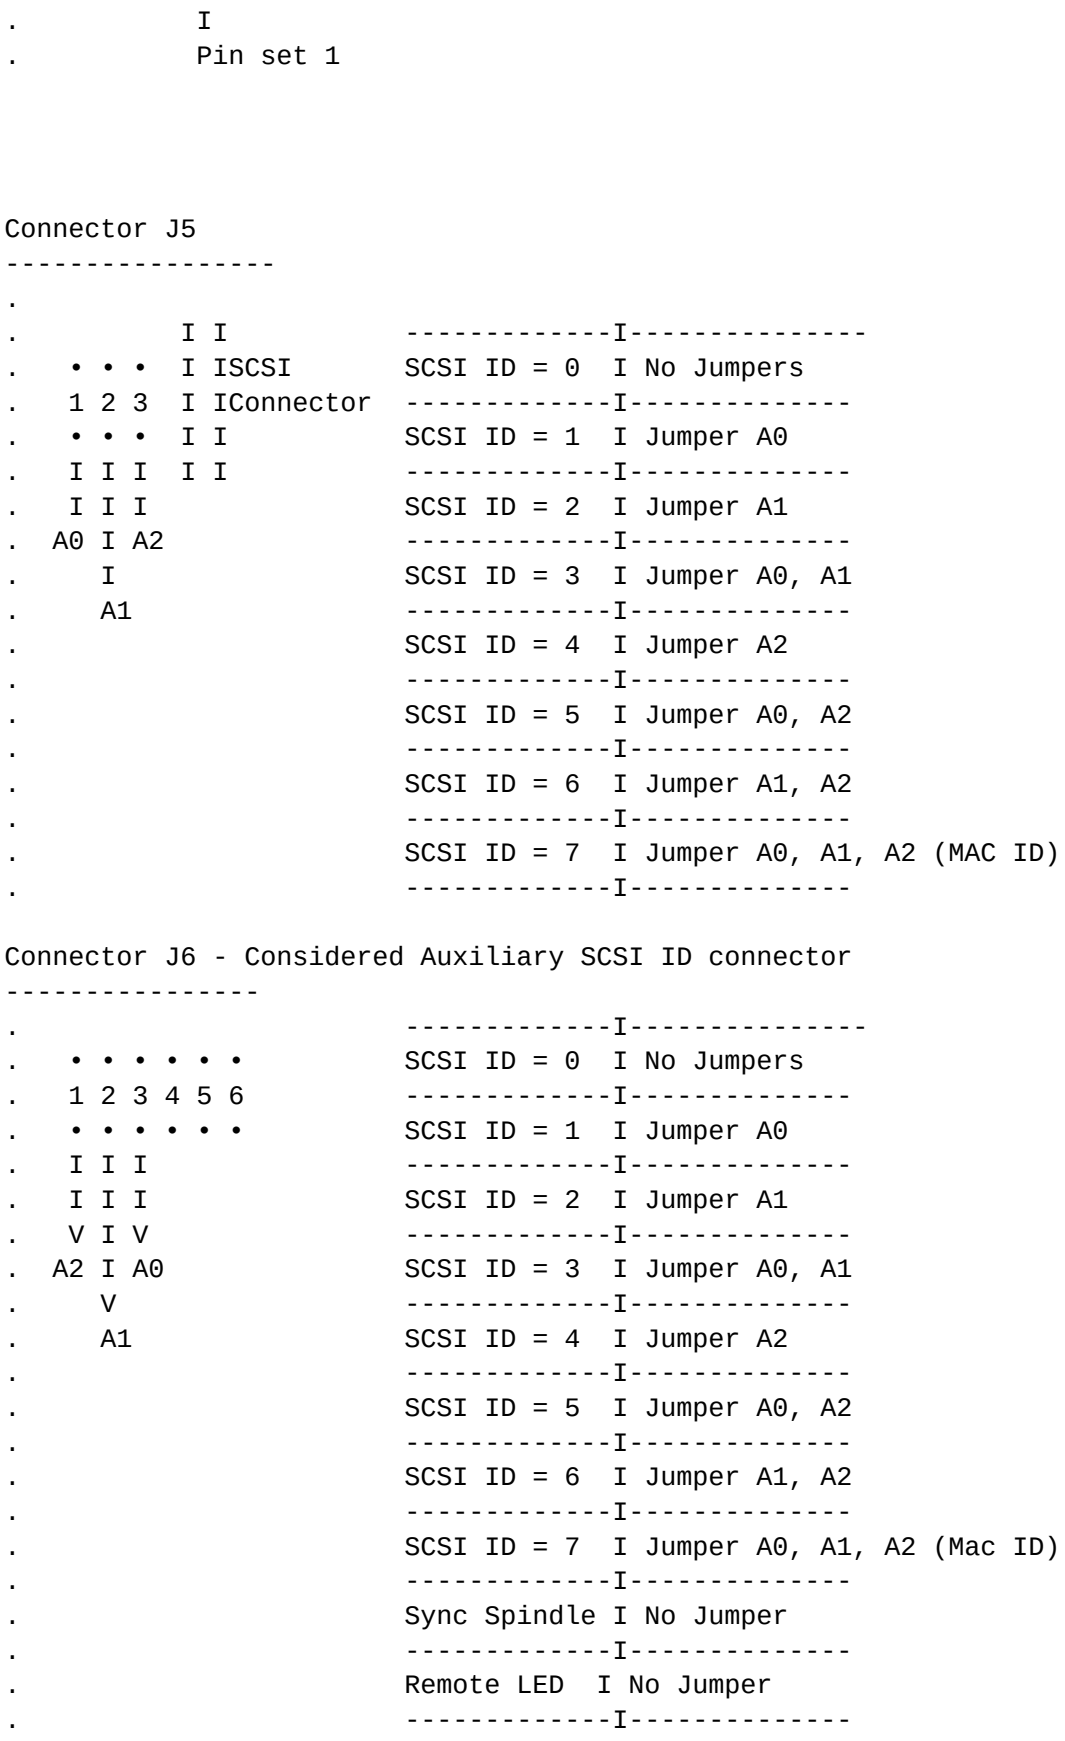
What is the SCSI pin configuration for Apple's 500 MB and 1 GB hard drives?

DISCUSSION ----------

Remember to use Apple drives only in the systems for which they were originally intended. Apple ships hard drives in certain configurations due to availability, pricing, and technical specifications (such as termination power and power draw). It is important to order and use the correct part for the corresponding Macintosh system.

The 500 MB and 1 GB Seagate drive SCSI pin configuration information is as follows:





Both these drives have an additional connector (J2), which is located on the top of the drive printed circuit board (PCB) and contains the following pin sets:

Connector J2

- Pin set 1 - TP - Term. Power from SCSI Bus - Jumper Installed
- Pin Set 2 - TP - Term. Power to SCSI Bus - Jumper Installed
- Pin set 3 - SS - Self Seek - NO JUMPER
- Pin Set 4 - PE - Parity Enabled - Jumper Installed
- Pin Set 5 - WP - Write Protect - NO JUMPER
- Pin Set 6 - ME - Motor Enable Option - NO JUMPER
- Pin Set 7 - DS - Motor Delay Start Option - NO JUMPER
- Pin Set 8 - RS - Reserved (Future Use) - NO JUMPER

Apple only supports drives in configurations for which they were intended. If an internal drive, or any drive for that matter, is installed in an external case, but is not sold by Apple in this configuration, Apple does not support it.

Article Change History:
31 Jul 1995 - Corrected misspellings; reformatted; reviewed for accuracy.
08 Dec 1994 - Specified that information is for Seagate drives.
24 Sep 1993 - Corrected orientation of Pin Set 1 on connector J6.

System 7.x: Can't Rename HD & Custom Icons, Shared Items (9/94)

Revised: 9/20/94
Security: Everyone

System 7.x: Can't Rename HD & Custom Icons, Shared Items (9/94)

==========

Article Created: 13 July 1993
Article Reviewed/Updated: 15 September 1994

TOPIC ----------

I can't rename the hard disk on my Macintosh running System 7 or System 7.0.1; or I changed the Macintosh hard disk icon to a custom icon. I chose "Get Info" under the Finder's File menu and pasted in another icon. I couldn't clear or change back to the original icon.

What causes this and what can be done to fix it other than completely reinitializing the hard disk?

DISCUSSION ----------

First ensure that you aren't running File Sharing, and you don't have the hard drive shared. Even if you do not set the sharing permissions for a particular volume, File Sharing still makes all volumes available to the owner for remote access. To change the name of a mounted volume, turn File Sharing off with the Sharing Setup Control Panel, rename the disk, then turning File Sharing back on again.

If an AppleShare File or Print Server software is running and you can't change the name of a mounted volume, then quit the sever software, rename the disk, then start the server software again.

If File Sharing or AppleShare Server software is not on, then the problem is with versions of System 7 prior to 7.0.1 where volume names and icons sometimes can't be changed. If you are a System 7.0 user and are having trouble renaming your hard disk or a folder, you may need Rename Rescue. The problem was corrected in System 7.0.1 and later.

What It Is

Rename Rescue is a small application that unlocks the name of folders and volumes.

How To Use It

If file sharing or AppleShare server software is on, turn it off.

From the Finder, select the items that need to be unlocked and drag them onto the Rename Rescue icon. You may select one or many items at a time. The Finder will automatically highlight Rename Rescue's icon. If Rename Rescue was not already started, it will open at this time, attempt to unlock, present a dialog for each item reporting the results. It will then automatically quit.

The possible results are:

- The item can not be renamed because it is being shared.
- The item can not be renamed because it is a System reserved folder.
- The item was already renameable.
- The item is now renameable.

After Rename Rescue unlocks the items, you should restart your Macintosh so the Finder will recognize the change.

Technical Information (how folders get locked in the first place)

The names of folders or volumes may get inadvertently locked on a computer running System 7.0. For this to happen, several things must occur. Unless all of these things have occurred, you will probably not need Rename Rescue.

- The volume or folder is (or was) used on a drive connected to a computer running System 7.0 (the problem is corrected in System 7.0.1 and newer).
- The volume or folder was shared with a computer running System 6.x (all versions of System 6) and the connection was unexpectedly interrupted (power failure, crash, or improper shutdown).
- Upon restart, the volume and/or folder on the System 7.0 computer may not renameable.

To get Rename Rescue, search on one of the following articles:

A/UX 3.0 & Large Monitors Fixed in A/UX 3.0.1 (1/96)

==========

Article Created: 12 July 1993
Article Reviewed/Updated: 25 January 1996

TOPIC ----------

The A/UX versions 1.x.x and 2.0.x both supported monitors running 1024 x 768 resolution. When I upgraded from A/UX 2.0.x to 3.0, an incompatibility occurred with this monitor size. Apple determined the problem was with A/UX 3.0 and the fix would be released in A/UX 3.0.1. I looked in the Tech Info Library and didn't see any information about this problem. Can you tell me if this situation does exist and has it been corrected in A/UX version 3.0.1?

I'm running A/UX on a Macintosh IIfx with a SuperMac 19 inch monitor that only does 1024 x 768 resolution. It's unclear whether the problem occurs with all 1024 x 768 resolution monitors or just SuperMac.

DISCUSSION ----------

Yes, the A/UX 3.0 problem with a 1024 x 768 resolution monitor was a known problem.

According to A/UX engineering, the incompatibility problem with 1024 x 768 resolution monitors in A/UX 3.0 has been fixed in A/UX 3.0.1. It's for all 1024 x 768 resolution monitors in general.

Portable StyleWriter: Attaching the Sheet Feeder (7/93)

==========

Article Created: 13 July 1993
Article Reviewed/Updated: 25 October 1993

TOPIC ----------

This article discusses how to attach the Automatic Sheet Feeder to the Portable StyleWriter.

DISCUSSION ----------

The Automatic Sheet Feeder (optional attachment) enhances the printer's capability to function as a desktop printer. The sheet feeder can hold up to 50 sheets of paper for automatic feeding to the printer.

The sheet feeder attaches to the back of the printer when the printer is in the vertical position.

To use the Auto Sheet Feeder, position dip switch 1 in the printer to the ON position (up). The dip switch is located under the paper cover on the right side.

Sheetfeeder Specifications:
Size: 12.2 x 8.6 x 2.3
Weight: 2.9 pounds
Bin Capacity: 50 sheets @ 17 pounds
Paper Sizes: Letter, Legal, A4, B5 envelopes
Paper Weight: 17 to 24 pounds

Article Change History:

Portable StyleWriter: Cleaning the Ink Cartridge (9/95)

Revised: 9/1/95
Security: Everyone

Portable StyleWriter: Cleaning the Ink Cartridge (9/95)

==========

Article Created: 12 July 1993
Article Reviewed/Updated: 01 September 1995

TOPIC ----------

This article describes how to clean the ink cartridge on the Portable StyleWriter.

DISCUSSION ----------

To clean the ink cartridge, follow these steps:

Step 1

Make sure the printer is turned off and has a sheet of paper loaded.

Step 2

Hold down the FWD ADJ and REV ADJ buttons, and press the Power button. The printer beeps.

Step 3

Release the Power button, keeping the FWD ADJ and REV ADJ buttons pressed. The printer beeps again.

Step 4

Immediately release the FWD ADJ and REV ADJ buttons and press the LF/FF button.

The "On Line" light blinks as long as the cleaning process goes on. The cleaning process stops automatically and a test pattern is printed. See the User's Guide for a diagram on how the test pattern should appear.

The lines on the test pattern should all be connected, with no breaks. If any of the lines are missing, repeat the cleaning process.

Note:
To clean the ink cartridge without printing the test pattern, do not press the LF/FF button in step 4.

IMPORTANT: Cleaning the ink cartridge consumes a small amount of ink. If you repeat the procedure unnecessarily, you reduce the life of the cartridge.

Portable StyleWriter: Manual Feed (7/93)

Revised: 7/13/93
Security: Everyone

Portable StyleWriter: Manual Feed (7/93)

==========

Article Created: 13 July 1993

TOPIC ----------

This article discusses how to load envelopes or other material in the Portable StyleWriter.

DISCUSSION ----------

You can load one envelope, transparency, or sheet of stock paper in the printer for a manual feed. The printer should be turned on, with the Power and Error lights lit.

1) Position the printer for vertical operation by rotating the footer on the back of the printer case.

2) Open the top cover.

2) Set the paper thickness adjustment dial in the correct position. The thumbwheel is located on the right bottom of the printer. For example: Set the dial to the envelope icon if you will be printing on an envelope.

3) Align/insert the envelope or sheet into the slot on the back of the printer.

   NOTE: The printer prints on the side of the envelope or sheet that faces up.

4) Press the LF/FF button to feed the material into the printer. The Error light turns off.

5) Press the On Line button to make the printer ready for printing.

Tech Info Library

Portable StyleWriter: Paper Thickness Adjustment Dial (7/93)

Revised: 7/13/93
Security: Everyone

Portable StyleWriter: Paper Thickness Adjustment Dial (7/93)

==========

Article Created: 13 July 1993

TOPIC

This article discusses how to set the paper adjustment dial on the Portable StyleWriter.

DISCUSSION

The paper thickness adjustment is a thumbwheel (dial) that is detented in one of the three positions. The positions are "sheet" position, a "center" position (marked with a dot) and the "envelope" position. The thumbwheel is located on the right bottom of the printer.

The paper thickness setting should be set to:
- Sheet position: for sheet paper
- Center position: for sheet paper with graphics and transparencies
- Envelope position: for envelopes and heavy stock paper.

Without the optional sheet feeder the user can load one sheet of paper or envelope at a time into the printer. Paper can be printed while the printer is horizontally or vertically oriented. To print envelopes the printer must be in the vertical position.

AWS 95: Mounting & Sharing Other NFS Volumes (6/93)

Revised: 7/13/93
Security: Everyone

AWS 95: Mounting & Sharing Other NFS Volumes (6/93)

==========

Article Created: 11 June 1993

TOPIC ----------

Can I mount a SUN NFS volume to an Apple Workgroup Server (AWS) 95 in order to access our SUN CADD server and make its data available to all Macintosh users? Also, would you recommend this arrangement (mounting SUN NFS volumes) for re-exporting 12 SUN file systems from one AWS 95? What impact does the NFS keep alive traffic have on AWS 95 performance?

DISCUSSION ----------

You can NFS mount any file system exported by the SUN and then make the mount point a Shared Item in the AppleShare Pro Admin program. We would not recommend this setup unless it was absolutely necessary. The keep alive traffic should have very little effect on the performance of the system. However, the access performance on this kind of shared item would not be as good as the one obtained from local volumes.

Apple Workgroup Server 95: Folder Contains Many Files (6/93)

Revised: 7/13/93
Security: Everyone

Apple Workgroup Server 95: Folder Contains Many Files (6/93)

==========

Article Created: 11 June 1993

TOPIC ----------

Our UNIX file systems tend to have large directories. What happens to an Apple Workgroup Server (AWS) 95 when a folder containing 200 files is opened? What happens to the AWS 95 when a folder containing 1500 files is opened? What happens to the Macintosh client in both of these scenarios?

DISCUSSION ----------

We tested the performance of the server opening a folder containing 300 files from a workstation. We tried this form a Macintosh IIfx and a Macintosh Quadra 950. In both cases, the first time we opened the folder it took about 20 seconds. Subsequent access to the same folder only took about 2-3 seconds.

We do not recommend large quantities of files to be stored in one single folder. This kind of organization will tend to run into limitations of some applications as well as some Finder limitations. Attempting to view large amounts of data in one window, something in the range of 500 - 1500 files will create very slow opening times and drop-out viewing problems. The specific number depends on RAM and computer.

This is a real world limitation imposed by the use of the List Manager in the SFGetFile dialog box used for opening files. There's nothing wrong with the directory structure, nor is there anything wrong with the application. Here's a description of what's going on:

> This limitation isn't specific to the AWS 95 System or System 7.x. The same limitation (with a slightly different variation) existed under System 6.0.x. The issue is that the SFGetFile call, which generates the Open dialog box in almost every application, uses the List Manager to display the files in the file list of the dialog box. The List Manager

has a 32K limit on the amount of data stored in a list. However, SFGetFile uses a portion of that 32K for data other than the file names. So you end up with 64 bytes per file if you have the maximum file name size of 31 characters (plus 1 byte for the length byte). We arrived at this number empirically by writing a program that created files with the names:

"000abcdefghijklmnopqrstuvwxyzab" to "999abcdefghijklmnopqrstuvwxyzab"

A good approximation of how many files will display is 32,767 / (file name size + 32). This results in 682 for 16 character names and 819 for 8 character names.

The bottom line beyond all of these calculations is that this is a hard limit. There's no workaround to display more data from a single folder within this dialog box. The list displays alphabetically, and the bottom of the list isn't displayed.

Also, as you increase the number of files in a folder, the performance at the Finder level decreases pretty dramatically. Although the Finder can handle these numbers of files, you'll see slowdowns in opening and closing windows. Another concern is the total number of files you're planning to have on a volume. There are very real limits on this as well, described in other articles posted in the Tech Info Library.

Another thing to keep in mind here is how many levels of nesting are going to be created within a folder.

"Inside Macintosh, Volume IV" states that there is no limit to the number of levels of subdirectories. Because of pathname limitations, it is not always possible to specify a file using its full pathname.

The maximum length of a pathname under the Finder - including the Volume and Folder - is 255 characters, including colons. For example:

InternalHD:Folder1:Folder2:Filename

This limitation has nothing to do with the Finder, it's a limitation of the file system.

AppleShare Pro: Installing The Software (6/93)

Revised: 7/13/93
Security: Everyone

AppleShare Pro: Installing The Software (6/93)

==========

Article Created: 11 June 1993

TOPIC ----------

What is involved in setting up the 230MB internal hard drive as an A/UX server? How is AppleShare Pro installed, or is this software and the operating system already installed?

DISCUSSION ----------

The A/UX Operating System will be preinstalled on the Hard Disk. The AppleShare Pro software will need to be installed via the regular installer. A/UX must be running before the installation of AppleShare Pro.

AppleShare Pro: Admin Similarities to Prior Versions (6/93)

==========

Article Created: 11 June 1993

TOPIC ----------

Is the basic administration of AppleShare Pro similar to AppleShare version 3.0.x?

DISCUSSION ----------

The basic administration for the server is the same. There are changes with respect to the fact that the root "/" volume can't be shared. Also, you can't share a folder that contains a UNIX mount point, you must share the folder that is the mount point. The Users, Groups and Privileges administration windows will look the same as in previous versions of AppleShare.

Fonts: Different Versions in LaserWriter ROM Change Output

==========

Article Created: 14 July 1993

TOPIC -----

When I print out Courier 12 point text on four different Apple printers (LaserWriter IINT, IIg, IIf, and Pro 630), there are clear differences between the printers, although I use the same TrueType system font. The kerning (space, between letters) isn't consistent. I didn't customize the kerning between letters.

Is there any explanation to account for this?

DISCUSSION -----

What you see is the difference between the various font versions of Courier from Adobe that are in the printer's ROM. The printer ROM has the current font version available at the time that the printers were released. Basically, Adobe controls these PostScript font changes and makes these changes to bring all of their fonts more in line with the actual fonts they license from various font foundries.

The Courier font on the LaserWriter Pro printers looks significantly lighter compared to previous LaserWriters. This is due to the version of the font that was built into the printer's ROM, as well as the fact that 600 dpi printers have more precise dot placement and use smaller dots than 300 dpi printers. With this situation, Apple decided to create a special LaserWriter Pro Font Tune-up Disk which contains a different version of the Courier font, and can be downloaded to the printer's RAM via the LaserWriter Utility. You can find this software on AppleLink following this path:

Software Sampler
  Apple SW Updates
    Macintosh
      Printing Software

If you require very consistent output, then a possible solution might be to

obtain a specific version of Courier from Adobe and then download that font to RAM, or a hard disk in all of the printers.

Font Substitution: Print Driver Substitutes 4 Fonts (7/93)

Revised: 8/23/93
Security: Everyone

Font Substitution: Print Driver Substitutes 4 Fonts (7/93)

==========

Article Created: 14 July 1993

TOPIC --------------------

Only four specific fonts get substituted when Font Substitution is turned on. The substitutions are as follows:

- New York changes to Times
- Geneva changes to Helvetica
- Monaco changes to Courier
- Seattle changes to a modified version of Helvetica

Is this a feature implemented by the LaserWriter driver?

DISCUSSION --------------------

This feature is implemented by the print driver, which performs the substitution when it senses that one of the four bitmap fonts are being used. Thus, while the print driver is converting the QuickDraw commands to PostScript and Font Substitution is checked, the driver generates the PostScript commands to use a Type 1 font instead of generating the PostScript for a bitmap.

LaserWriter Select 310: Printing From Both Ports (7/93)

Revised: 7/16/93
Security: Everyone

LaserWriter Select 310: Printing From Both Ports (7/93)

==========

Article Created: 15 July 1993

TOPIC ----------

I have two questions regarding a LaserWriter Select 310 connected to both a Macintosh and a PC.

1) The Select 310 manual states that you shouldn't have both the serial and the parallel cables connected at the same time. Are there any problems leaving both cables plugged in?

2) I have read that you cannot print from both systems without shutting the printer down. I do in fact print from both at the same time with no problems. Can you explain why it works for me?

DISCUSSION ----------

1) The manual is correct in stating that the serial and parallel port of the LaserWriter Select 310 cannot be used at the same time. Having the ports physically connected at the same time will not cause any damage to the printer, and is just stated to prevent the possible use of both simultaneously.

2) Basically, the LaserWriter Select 310 DOES NOT support port arbitration like the Personal LaserWriter NTR, LaserWriter IIf/IIg, and LaserWriter Pro printers. The printer can get very confused if it is communicating on one port, and suddenly receives some spurious data from another. It is possible that you may be able to print to both ports simultaneously since both ports are in fact active, however, this is neither suggested or supported by Apple.

Using the Performa's Launcher (7/93)

Revised: 7/16/93
Security: Everyone

Using the Performa's Launcher (7/93)

==========

Article Created: 14 July 1993

TOPIC ----------

The following article describes the use of the Launcher program installed in all Performa models.

DISCUSSION ----------

The Launcher provides convenient access to the most commonly used application programs, folders, and documents. The Launcher window appears at the bottom left of the screen when the Macintosh Performa is powered on. The application programs that came with the Macintosh Performa automatically appear in the Launcher. Items are opened from the Launcher by clicking on the item's button.

To install an item in the Launcher:

1) Find the desired item and click on it.

2) Next, choose "Make Alias" from the File menu. The alias appears on top of the original. Its name is in italics and ends with the word "alias."

3) Double-click the System Folder to open it and locate the Launcher Items folder.

4) Drag the alias of the item to be installed into the Launcher Items folder.

5) Close the Launcher Items folder and the System Folder by clicking in the close box in the upper left corner of those windows and click on the Launcher to make it the active window. Items in the Launcher are arranged in alphabetical order, so it may be necessary to scroll to locate the button for the program which was installed.

If the Launcher doesn't appear on your screen when your Performa is first turned on:

1) Use the Finder's Find command to locate the Launcher file. It's usually located in the Control Panels folder inside the System Folder.

2) After selecting the Launcher file, select the Make Alias command from the File menu to create an alias for the Launcher file.

3) Drag the Launcher alias into the Startup Items folder inside the System Folder on the hard disk.

To remove an item from the Launcher window:

1) Open the Launcher Items folder inside the System folder.

2) Drag the icon of the item you want to remove from the Launcher Items folder.

If you don't want the Launcher window to appear when you turn on your computer:

1) Open the Startup Items folder in your System Folder.

2) Drag the Launcher alias out of the Startup Items folder.

More information can be found in the manual that came with your computer.

Apple Print Pack: Supported Drivers (7/93)

==========

Article Created: 13 July 1993

TOPIC -----

Does the Apple Print Pack(M7900LL/A) support IBM 4070ij portable printer?

DISCUSSION -----

GDT Softworks, the developer of Print Pack, says that the IBM 4070ij is supported with the Canon BJ10EX driver. The IBM 4070ij is actually a Canon engine. Print Pack currently ships with the following 4 drivers:

- Canon BJ10EX
- Diconix 701
- Epson FX
- Epson LQ

The Print Pack comes with an upgrade coupon for the full blown version of Power Print directly from GDT Softworks which includes a total of 16 print drivers and Background printing capability. The Print Pack doesn't include Background printing capability. Please contact GDT Softworks directly for information on the drivers available in the upgrade. To locate a vendor's address and phone numbers, use the vendor name as a search string.

AWS 95, A/UX 3.0.1 and DEC One GB Drive (7/93)

Revised: 7/20/93
Security: Everyone

AWS 95, A/UX 3.0.1 and DEC One GB Drive (7/93)

==========

Article Created: 15 July 1993

TOPIC --

I purchased A/UX several months ago and ended up returning it because of compatibility problems with a DEC DSP 3105S one GB Hard Drive.

I now want to purchase an Apple Workgroup Server (AWS) 95, but I'm concerned this same problem will be encountered.

Has the incompatibility between A/UX and the DEC DSP 3105S one GB Drive been resolved?

DISCUSSION --

Yes, the problem with the DEC DSP 3105S one GB drive on an AWS 950 has been fixed, and tested with an AWS 95 and A/UX 3.0.1.

Macintosh Hardware System Update 2.0: Description (7/93)

==========

Article Created: 19 July 1993

TOPIC ----------

This update offers software improvements, and contains software enhancements to address specific problems sometimes encountered. This update requires Macintosh system software version 7.1 and isn't intended for Macintosh Performa users.

DISCUSSION ----------

In general, the update provides system-level improvements to increase overall system reliability on most Macintosh computers. Here are specific features of the update:

- Addresses possible floppy disk and hard disk problems the Macintosh IIsi, IIci, IIvx, IIvi, Centris, Quadra, and PowerBook computers.
- Manages fonts in the computer's memory more efficiently.
- Improves the accuracy of the system's clock in Macintosh LC, LC II, IIsi, IIvx, IIvi, Classic II, Quadra 900, and Quadra 950 computers.
- Corrects problems ejecting floppy disks when the computer is shut down, on Macintosh IIsi, IIci, IIvx, IIvi, Quadra 700, and Quadra 950 computers.
- Corrects color problems users may have with the Apple Basic Color monitor on Macintosh Centris and Macintosh Quadra computers.
- Removes horizontal white lines that may appear while scrolling on Quadra and Centris systems with a Macintosh 16-inch Color Display.
- Improves the reliability of high-speed modems and similar devices connected to Macintosh LC, LC II, IIsi, IIvx, IIvi, Classic II, Quadra 900, and Quadra 950 computers.

- Includes HD SC Setup version 7.2, which gives users more flexibility to format large hard disks between 1 and 2 gigabytes.

- Includes Apple Disk First Aid version 7.1.1, a utility that repairs damaged disks.

- Updates the Macintosh PowerBook Control Panel and Express Modem software to support standard communications software.

- Includes Sound Manager version 3.0, which enhances sound performance on most Macintosh computers.

- Adds software for the Apple Adjustable Keyboard to allow connecting the keyboard to any Macintosh computer without separately installing special keyboard software.

- Updates the Memory Control Panel (version 7.1.1) fixing possible memory problems that occur while using large RAM disks with System 7.1.

- Updates the System Enabler (version 1.0.5) for the Macintosh Color Classic which enables adding the Apple IIe Card and software to the Classic. In addition, the System Enabler improves mouse performance on the Color Classic.

Apple Workgroup Server 95: AppleTalk Version Info (7/93)

Revised: 7/16/93
Security: Everyone

Apple Workgroup Server 95: AppleTalk Version Info (7/93)

==========

Article Created: 12 July 1993

TOPIC -----

This article describes Apple Workgroup Server (AWS) 95 AppleTalk version information.

DISCUSSION -----

The AWS 95 running A/UX 3.0.1 will report that it is running AppleTalk version 56 when queried by applications such as Inter•Poll. AppleTalk version 56 is Phase 2 compliant, is fully compatible with, and can coexist on an extended AppleTalk network with devices running versions 53 or later of AppleTalk. All versions of AppleTalk running on devices located on LocalTalk based (non-extended networks) are completely compatible with, and can inter-operate with, the AWS 95.

The AppleTalk driver used in the AWS 95 is an A/UX based device driver. Installing a Macintosh OS based AppleTalk driver into the System Folder of an AWS 95 will not update the AppleTalk version.

AWS 95: Server In Mixed NFS and AppleShare Environment (6/93)

Revised: 7/16/93
Security: Everyone

AWS 95: Server In Mixed NFS and AppleShare Environment (6/93)

==========

Article Created: 11 June 1993

TOPIC -----

Is the Apple Workgroup Server (AWS) 95, A/UX 3.0.1, and AppleShare Pro solution successful as a file server in a mixed NFS and AppleShare environment?

DISCUSSION -----

Yes, both services are supported and if the system is configured correctly, the performance will be very good on both services (NFS and AppleShare). One thing to keep in mind is the A/UX kernel is configured to reserve 50% of the available RAM for kernel buffers. In a 32MB configuration, this leaves about 16MB of RAM free before the system starts to utilize the swap space. The Finder environment where the AppleShare Pro server will run, requests a memory partition of 16MB. If other UNIX processes are started, the system will start swapping and the performance will degrade.

AWS 95 and A/UX: Filename Character Translations (5/95)

Revised: 5/11/95
Security: Everyone

AWS 95 and A/UX: Filename Character Translations (5/95)

==========

Article Created: 11 June 1993
Article Reviewed/Updated: 11 May 1995

TOPIC ----------

In mixed NFS and AppleShare environments, what are the illegal filename potentials? What happens when illegal file names are encountered by a SUN workstation? What can be done to address these file name problems?

DISCUSSION ----------

A/UX 3.0.1 implements a new environment variable called TBTRANSLATESLASHES. This variable affects how the slash (/) character is translated when it is in the name of a file in the Finder. If the variable is not defined, the "/" is translated and stored as an "_" (underscore) in the file system. If the variable is defined, the "/" will remain in the name and the system will store it as a ":" (colon) in the file system. What this means is that you will see a slash in the name when looking at the file from the Finder and as a colon when viewed from the CommandShell or another UNIX workstation via NFS, telnet, and so on. The files that start with a "." (dot) are stored in the finder with the "•" (bullet) character and in the file system the "." remains a "." (dot). These are the only character translations performed.

Apple Workgroup Server 95 and Authentication daemons (6/93)

==========

Article Created: 11 June 1993

TOPIC -----

Is there a need to run PC/NFS, BWNFSD and/or another authentication daemons on the Apple Workgroup Server (AWS) 95?

DISCUSSION -----

To run AppleShare Pro and have Macintosh Clients you do not need to run either PC/NFSD or BWNFSD. For the AWS 95 to become an NFS server, you have to configure the kernel to have NFS support via a simple newconfig command (newconfig nfs). This will start /etc/nfsd. If the system will also be used as an NFS client, the /etc/biod can also be started.

AWS 95 and UNIX Administration (6/93)

Revised: 7/19/93
Security: Everyone

AWS 95 and UNIX Administration (6/93)

==========

Article Created: 11 June 1993

TOPIC -----

On an Apple Workgroup Server (AWS) 95 are basic A/UX administrative commands and syntax similar to Berkeley v. 4.1.3, AT&T, AIX and Solaris? For example:

```
cp
find
grep
ls -lg
mv
passwd
rm
rmdir
```

DISCUSSION -----

The AWS 95 is running the A/UX operating system which is UNIX. All of the basic administration of the system will be the same as on any other UNIX system. It is important to keep in mind that while all the systems you mentioned are based on UNIX, each one has its own idiosyncrasies.

AWS 95: Does The Process Table Increase As Users Login (6/93)

Revised: 7/19/93
Security: Everyone

AWS 95: Does The Process Table Increase As Users Login (6/93)

==========

Article Created: 11 June 1993

TOPIC -----

When the number of users login, or volume mounts increases on the Apple Workgroup Server (AWS) 95, does the number of processes listed in the process table increase? If so, what is the process increase ratio? For example: one-to-one, two-to-one as login, mounts increase?

DISCUSSION -----

The number of AppleShare clients will not increase the number of UNIX Processes. The AppleShare Pro software runs inside of the Finder Environment under A/UX. The Finder environment under A/UX is just one UNIX process.

I should mention that there is a big difference between a UNIX style login and an AppleShare style login.

In the UNIX environment, when a user logs in all the commands executed will be executed in the UNIX host where the user logged in. For each user that performs a login, the user will have at least one process attached. In the case of network connected user (using TCP/IP services) there will be more likely two processes. One of these processes is started by the inetd super server to service the connection, the other process is usually a UNIX shell (sh, csh, ksh, tcsh, and so on) which provides the user the interface to the Operating System. If the user executes a command, another process will be started for as long as that command lives.

In the AppleShare environment, the user does not really login in to the server. The user is attaching to the server to obtain access to disk space only.

AWS 95: How Many NFS Mount Points (6/93)

==========

Article Created: 11 June 1993

TOPIC -----

How many NFS mounts to one Apple Workgroup Server (AWS) 95 would you recommend as the limit? What impact does the NFS keep-alives have on the AWS 95 performance?

DISCUSSION -----

The number of NFS mounts is dependent on kernel memory. Also the number of NFS mounts is restricted by the total maximum size of the mount table. It is configurable via 'kconfig' with the NMOUNT parameter, the default of NMOUNT is 32. The impact of these mount points on the server will depend on how the mount points are created (soft, hard, bg, time out values, NFS cache settings, retry values, retransmission values, and so on).

Hayes Ultra Modem Back To Back Connect (7/93)

Revised: 7/20/93
Security: Everyone

Hayes Ultra Modem Back To Back Connect (7/93)

==========

Article Created: 17 July 1993

TOPIC -----

Can you provide me with the configuration strings to set up a pair of Hayes Ultra 9600 or 14.4 modems to do back to back connections for demo purposes? The problem is to set the modems up to connect without having to get two phone lines installed when doing demos. I'm looking for a detailed script for setting a demo system up without using an expensive "modem eliminator" box. Any help?

DISCUSSION -----

Sure, you can do that by setting them up in leased line mode and just running a regular phone cord from the line jack on one to the line jack on the other. This will work fine as long as you aren't going more than a few feet. Here's how to setup for leased line mode:

To set two Ultras up for leased line, take the following steps:

1) Designate one modem as "answering" and the other as "originating". It doesn't matter which is which, or where each is placed, but one must generate answer tone while the other is in originate mode.

2) Send the answering modem the following string:
   AT&F&L1S0=1&Y&W

3) Send the originating modem the following string:
   AT&F&L1&Y&W

4) On both modems, set dip switch number 1 to the down position. This should be done *after* you've sent the above setup strings. The remaining 3 switches stay in the up position. You'll find the dip switches on an Ultra underneath the front face plate just to the left of the lights.

That's it. You can test this configuration by hooking the modems up back to back. By that, I mean take the telco cable that came with the modem and run it from the line jack on one modem to the line jack on the other. When you power the modems on, they should sync up and get a carrier with each other.

Chinese System Software File Encoding Method (7/93)

==========

Article Created: 16 July 1993

TOPIC --------------------

I need to know what character encoding method is used for simplified Chinese in WorldScript. I'm setting up an office using Chinese system software and I'm trying to develop a standard software set. The two common encoding types are GB and Big 5. I need to know which one Apple uses, or if Apple developed it's own.

DISCUSSION --------------------

We were able to verify the character encoding methods used for Traditional and Simplified versions of Chinese System Software for WorldScript; they are BIG 5 and GB respectively. BIG 5 is used for Traditional Chinese system software, and GB used for Simplified Chinese system software.

StyleWriter II: ReadySetGo 4.5 Printing Problem (8/93)

==========

Article Created: 20 July 1993
Article Reviewed/Updated: 17 August 1993

TOPIC -----

I'm using ReadySetGo version 4.5, on a PowerBook 140 with System 7.0.1. When I print to my StyleWriter II, the spacing between the last two characters of every word is joined together.

DISCUSSION -----

ReadySetGo is developed by a company called Manhattan Graphics. They informed us that version 4.5a of ReadySetGo is a very old. The latest version is 5.0 which should resolve the problem you are experiencing.

ReadySetGo 6.0 will be released August 23,1993 . To locate a vendor's address and phone numbers, use the vendor's name as a search string.

Article Change History:
17 August 1993 - Verified release date of ReadySetGo 6.0.

PowerBook Fax/Data Modem: There Is No Rev. 1.2 of ROM (7/93)

==========

Article Created: 19 July 1993

TOPIC ----------

On the Fax Sender 1.0.3 disk there is a Read Me document that refers to PowerBook Fax/Data Modem firmware version 1.2.

I have a customer who has version 1.0 of the firmware. He would like to know the difference between version 1.0 and 1.2 of the firmware and how he goes abut getting the updated ROM version.

DISCUSSION ----------

Although at one time there were plans to make a version 1.2 of the Fax/Data Modem ROM, it was never produced. Unfortunately, the Read Me file was included as part of the Fax Sender 1.0.3 software by mistake. Since the 1.2 ROM does not exist, there is nothing to upgrade.

Transceiver Without Termination (7/93)

==========

Article Created: 19 July 1993

TOPIC -----

I have a wiring plant originally offered by DEC that requires a non-terminated thin Ethernet connection. The wiring is thin coax segments on a DEC DEMPR that allows for eight drops to a wall plate in an office. When I connect a special drop cable to the wall plate it makes a loop from the wall plate to the computer eliminating the need for T connectors and terminators. This cable ends in a BNC and usually connects directly to the Ethernet's coax BNC. This is a standard DEC wiring scheme that is second sourced by AMP.

What exposure will I have if I open the Apple transceiver with an empty BNC connector on one post?

DISCUSSION -----

UNICOM Electric, Inc. is producing an AAUI compatible thinnet (10BASE2) transceiver that has a single non-self terminating female BNC connector interface. We recommend that you don't use a barrel connector to open one side of the Apple thinnet transceiver, because this solution can have significant effects on the reliability of the network. To locate a vendor's address and phone number, use the vendor name as a search string.

AWS 95: A/UX Disk Defragmentation (7/93)

==========

Article Created: 19 July 1993

TOPIC ----------

I just purchased an Apple Workgroup Server (AWS) 95 for file services. I regularly defragmented the hard drive on my AppleShare 3.0 server and it showed a noticeable speed increase. Will doing this help the AWS 95 UNIX partition?

1) Is it necessary to defragment the UNIX partition of the hard drive of the AWS 95, and will it help keep performance at its maximum?

2) What programs are available to do this on a UNIX partition?

DISCUSSION ----------

As with most file systems it may become necessary to defragment a UNIX based file system from time to time. The UNIX based utility program "fsck" will report the percentage of fragmentation on a per file system basis. You can use the command fsck /dev/rdsk/cx0xdxsx replacing the x's with the appropriate information. For example:

```
macamy.support.apple.com.root # fsck /dev/rdsk/c300d0s0
** /dev/rdsk/c300d0s0
** Last Mounted on /
** Root file system
** Phase 1 - Check Blocks and Sizes
** Phase 2 - Check Pathnames
** Phase 3 - Check Connectivity
** Phase 4 - Check Reference Counts
** Phase 5 - Check Cyl groups
8056 files, 97206 used, 839119 free (1751 frags, 104671 blocks, 0.2%
fragmentation)
```

The only way to defragment a file system is to use a backup utility such as the UNIX utilities dump, cpio, tar, or the Macintosh OS based Retrospect

(version 2.0ai). There is a small section on this topic included in the AWS 95 "Server Administration with A/UX 3.0.1" manual pages 230-231.

LaserWriter Pro 630: Disable Sleep Mode? (7/93)

Revised: 7/20/93
Security: Everyone

LaserWriter Pro 630: Disable Sleep Mode? (7/93)

==========

Article Created: 20 July 1993

TOPIC ----------

Is there a way to disable the sleep mode on a LaserWriter Pro? A customer claims that sleep mode is causing his toner to go bad, and he wants to "unsleep" the printer.

DISCUSSION ----------

Once the sleep mode has been enabled on a LaserWriter Pro, there is no way to turn it off. The Energy Star software does not "enable" the sleep option, it allows the user to adjust the sleep timer to meet the requirements of the environmental Protection Agency’s Energy Star program.

The printer has a default value of 4 hours of inactivity before "sleeping." The PostScript files provided with the Energy Star software enable the user to change this setting to 30 minutes, 1 hour, 2 hours, and the default value of 4 hours.

Sleep mode should not cause any difference in toner usage. The only side effect from sleep mode should be a 30 second delay in printing the first page of output after the LaserWriter Pro has entered sleep mode.

Monitors: Model Number Versus Marketing Number (7/93)

==========

Article Created: 20 July 1993

TOPIC -----

What is the difference between the model or family number, M1212, on the back of the Apple Color Monitor (14") and the number on the suggested retail price list, which is M1198LL/A?

DISCUSSION -----

The model number M1212 is stamped on all Macintosh Color Displays (14" Color monitors.) This number is the ID number used for monitor safety and FCC licensing.

The number M1198LL/A is a marketing number (or finished goods number) that describes not only the monitor itself, but also includes the shipping box, packaging material, manuals, and other items that may be contained in the box.

Performa 450: Accelerators Versus Power Cache Cards (7/93)

Revised: 7/21/93
Security: Everyone

Performa 450: Accelerators Versus Power Cache Cards (7/93)

==========

Article Created: 20 July 1993

TOPIC -----

Are accelerators and power cache cards the same? Can I run a 40MHz power cache on my Performa 450 (68030 @ 25MHz) or do I need a 40MHz accelerator, too? Will it speed up programs like CAD programs?

DISCUSSION -----

Cache cards and Accelerators are not the same thing. Cache cards contain SRAM; Static RAM. This RAM is used only by the CPU and has a very high transfer rate between the CPU and itself. Cache memory will increase the speed of most applications, because the CPU stores commands in this ram and doesn't have to fetch instructions by way of the CPU BUS. This increases your speed where tasks are repeated. For example, displaying pictures. The application reads the data from the drive, then has to do repetitive processing to display the picture.

Accelerator Cards replace your current CPU (in your case a 25MHz 68030). By increasing the speed of your CPU, you speed up the processing time. An important thing to remember however, is that when comparing speeds of different accelerator cards make sure the CPU is the same. A 25MHz 68040 is MUCH faster than a 25MHz 68030.

Performa: Launcher versus Apple Menu (7/93)

==========

Article Created: 19 July 1993

TOPIC -----

Which uses more memory,installing items in the Apple Menu or in the Launcher?

DISCUSSION -----

Both take up the same amount of Hard drive space and RAM. The only advantage to having things in the Apple Menu, is that they can be used at anytime without having to switch back to the Finder.
